THE MOTOR CYCLE

Largest Circulation — *Founded 1903.*

MOTOR BICYCLES – SIDECARS – CYCLE CARS

No. 581. Vol. II. Thursday, December 25th, 1913. Price 1d.

Published Weekly.

COPYRIGHT—REGISTERED AS A NEWSPAPER FOR TRANSMISSION IN THE U.K.

You will find THE IDEAL XMAS GIFT for yourself at

WAUCHOPE'S

Big Variety. Keenest Values. Most Liberal Exchanges.

Easiest of Easy Terms.

And the list we are issuing to-day makes the way easy for you and every buyer. It includes

3½ h.p. 1913 3-sp. **Rover** & Rover s'car	£57 10
5 h.p. 1912 2-speed **Kerry** & Kerry s'cr	£50 0
3½ h.p. **Quadrant** and sidecar	£15 0
3½ h.p. 1913 2-sp. Twin **Motosacoche** and sidecar	£50 0
3½ h.p. 1911 2-sp. **Allday** and sidecar	£32 10
8 h.p. 1910 Twin **Minerva** and sidecar	£27 10
6 h.p. 1912 3-sp. **Chater Lea** & sidecar	£50 0
5-6 h.p. **Rudge Multi** and sidecar	£57 10
3½ h.p. 1913 2-speed **Premier** and s'car	£45 0
8 h.p. 1913 3-sp. **Chater** and Chater coach-built sidecar	£70 0
6 h.p. 1911 2-speed **Clyno** and sidecar	£32 10
3½ h.p. 1913 3-sp. **Triumph** & Swan's'car	£52 10

THE BOOK OF THE DAVISON INVENTIONS

FULL OF INVENTIONS THAT IMPROVE EFFICIENCY, ECONOMISING OIL AND PETROL, AND MAKING MOTOR CYCLING PLEASURE MORE PERFECT. WRITE FOR A COPY.

THE DAVISON TANK.

The most perfect Tank yet invented, perfectly manufactured, and fitted with the universally adopted **Davison Oil and Petrol Gauges** made by the Inventor.

THE WARNING TAP, WITH BYEPASS.

Warns the rider when his stock of Petrol is getting low.

Transparent Unbreakable Stopper.

Hinged or Screw. In a range of sizes to fit every machine. Enables the rider whose Tank is not fitted with a gauge to see the contents without opening.

Write for Catalogue that gives full details of these and many other useful interesting motor cycle inventions.

THE DAVISON OILER.

Provides continuous visible drip feed lubrication, which can be increased or reduced at will while riding.

The SHUT-OFF DRIP FEED LUBRICATOR.

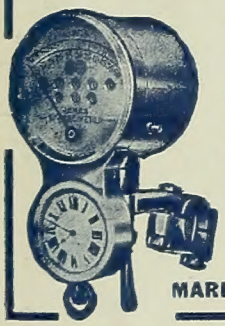
Allows supply of lubricant to be shut off without disturbing Needle Valve.

A. C. DAVISON, 163, Arlington Road, Camden Town, LONDON, N.W.

The JONES SPEEDOMETER

ANOTHER GOLD MEDAL AWARDED — TURIN EXHIBITION.

A Speedometer that is not accurate is an abomination; it is more, it is dangerous. The opportunities of testing such instruments for accuracy are not usually available. Expert use of the stop watch and measured distances are not easily assured. Buy the instrument which above all others has demonstrated its qualities again and again. "The Jones" is a purely mechanical instrument constructed on a principle of unvarying natural law. Its accuracy of reading was the most important feature to decide the verdict of the R.A.C. Highest Award and Gold Medal in the only competitive official Speed Trials.



The very latest Unsolicited Testimonial.

Mr. Gilbert M. Duprez, of Diglis Close, Addlestone, writes—I have had great satisfaction from your Speedometer, and at all speeds the needle is always steady, a remark that applies to few makes at present on the market.

PRICES FROM 3 GUINEAS.

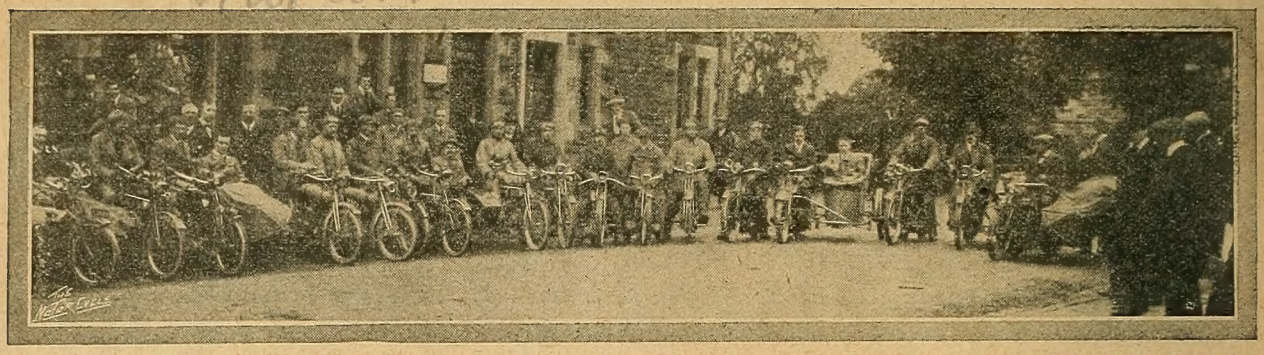
Innovations of the Six Days' Trial.

ELSEWHERE in this issue we reproduce a summary of the Auto Cycle Union Six Days' Trial regulations. This year it will be noticed that the trial will be in the nature of a prolonged test, and not a series of daily trials. This is quite an innovation, and we think quite a desirable one, which has been brought about by reducing the amount of time spent on the machines to a minimum. Now the idea of this is not to prove how little attention the modern motor cycle requires, but to encourage development, to render motor cycles mudproof and weatherproof, to improve the lubrication and, incidentally, to ensure that the lubricant given is retained for a reasonable period, and to encourage manufacturers to design machines which can stand long distances under arduous conditions without an excessive amount of tinkering, but most emphatically not to lead the general public to believe that their machines will run day after day without being properly looked after. Every intelligent user of a machine must know that, like all other machinery, a motor cycle needs care, but what the A.C.U. desires to do is to reduce that amount of care required to the lowest point. Other innovations embodied are—(1) a flexibility test, (2) a speed test, and (3) that during the trial notice will be taken of the appearance of the machine and rider. Now in the case of No. 1, as we pointed out in a recent leaderette, the flexibility of engines is a point which has been so far somewhat neglected by manufacturers. Here is a chance for the makers of automatic carburetters to demonstrate that these accessories may give sufficient flexibility to satisfy the judges, enough power to enable the machines to surmount the test hills, and a reasonable degree of economy. (2.) The speed tests, which, it is assumed, will be held at the conclusion of the trial, will show how the machines have stood up during their four days' hard work. Excessive speeds have not been demanded, but it will rightly be expected that reasonable speeds will be attained. (3.) This is a most important item, and manufacturers of clean engines may depend on their riders having a chance of keeping themselves in a similarly spotless condition. Not the least interesting feature of the trial will be its international aspect, as this year's competition is the one chosen by the newly-formed Fédération Internationale des Clubs Motocyclistes to revive international competitions between the various motor cycle bodies which form the Federation. It is earnestly hoped that the countries represented in the Federation will send their teams. Canada and America are anxious to compete, and it remains for France, Belgium, Holland, Germany, Italy, Austria, Denmark, and other nations on whose roads motor cycling is possible, to send their representatives.

New Features of the Trial.

AS regards the rules, we note with pleasure that spare wheels may be carried, and that riders must not include in their personal apparel any article of clothing or adornment which might be considered a self or trade advertisement, which will exclude those grotesque headgears which have rendered certain competitors ridiculous and brought discredit on the A.C.U. on previous occasions. Another new feature, and also an excellent one, is that spares must be declared and packed in separate toolbags which will be sealed, and that "legitimate" spares, such as tyres, repair outfits, belts, fasteners, chain link parts and plugs, do not come under this category. It will be noted that gear ratios must be declared on the entry forms. The schedule time will be calculated at 20 m.p.h., but extra time will be allowed when the exigencies of the road demand it. Motor bicycles will be allowed eight minutes' grace late or early, and passenger machines ten minutes at any point on the route, while to enforce the set limit being adhered to, the undesirable but unavoidable secret check will be instituted. Other innovations to which we may call attention are to the effect that on certain days the route is to be covered "non-stop"; that those who have withdrawn may not drive over the route with or near any competitor, and a violation of this regulation renders the offender liable to suspension or the competitor he accompanies liable to disqualification. As regards the classes, an innovation is that for monocars designed to carry one person, while it will be noticed that the system of marking according to classes is excellent, and that the single-seated vehicles referred to above are expected to earn the same percentage of marks to gain a gold medal as motor cycles in Division 1. The trial will not be a long one but different from those of previous years—it will consist of five hard days, and the sixth devoted to a thorough and careful examination of the machines. It may be recollected that last year we suggested a speed test in connection with these trials on the sixth day, and recommended Brooklands, as it would prove so convenient for the examiners.

T392/4



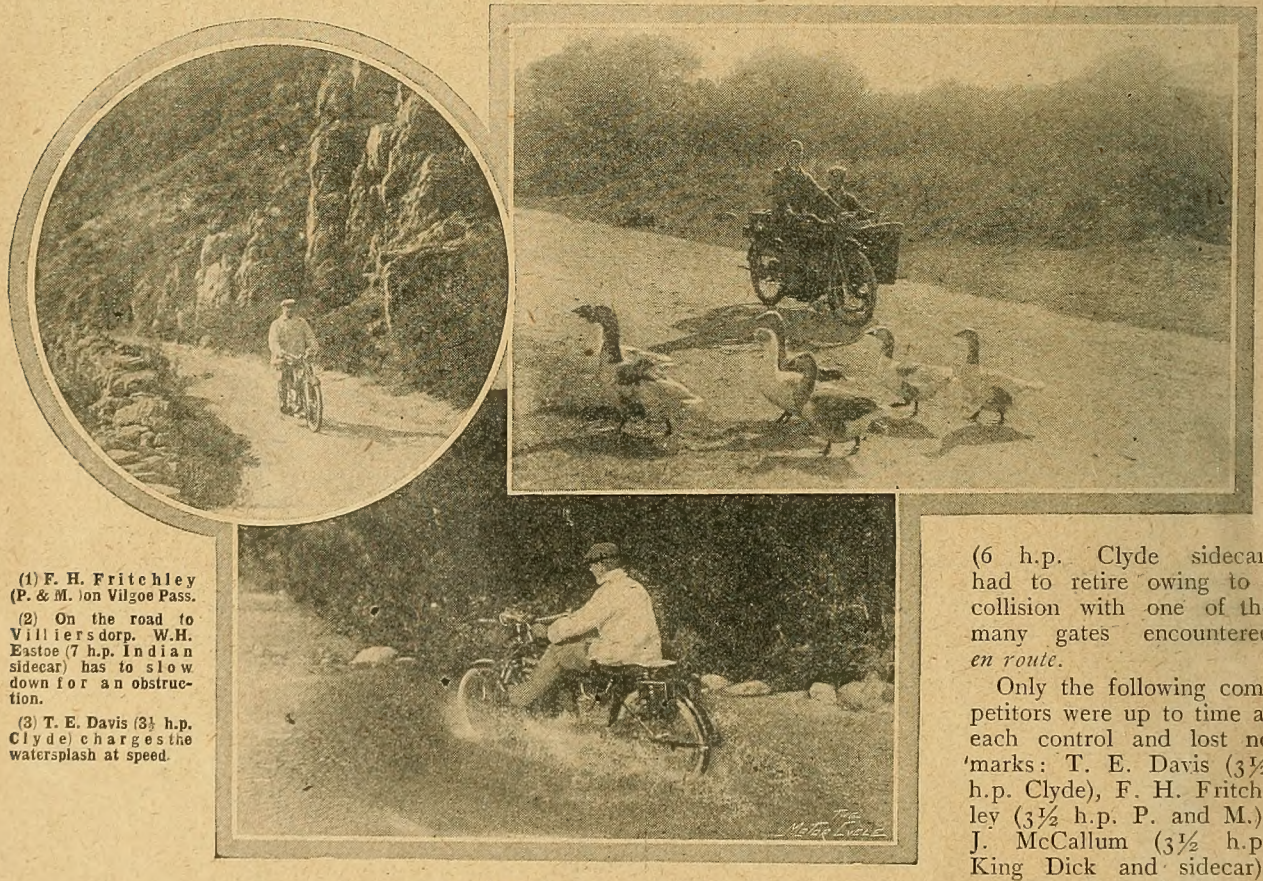
Group of motor cyclists at Callander after their arrival for the Scottish inter club meeting which was marred by bad weather.

A Two Day Reliability Trial at the Cape.

A OUT and home trial of 150 miles, with an overnight stay at Villiersdorp—a typical country village in the Western Province—took place at the end of May. T. E. Davis (3½ h.p. Clyde), after passing Belville, collided with a trap, and found himself pinned underneath his machine; W. Trefz, on a similar machine, who was close behind him, also fell. They were, however, able to continue their journey. F. H. Fritchley (3½ h.p. P. and M.) made a particularly good ascent of Sir Lowry Pass, as did J. McCallum (3½ h.p. King Dick sidecar) and W. H. Eastoe (7 h.p. Indian sidecar).

The River Zonder End—four miles from Villiersdorp—had to be forded, and, as the water was high, J. Kirkup (3½ h.p. B.S.A. and sidecar) had his magneto fouled midstream. Mrs. Kirkup, who occupied the sidecar, in despair climbed on her seat and shouted for help! But as no help came along the rider had to take off his boots, roll up his trousers, and work his way across. Kirkup lost fifty minutes before reaching Sir Lowry Pass, while W. J. Thompson (6 h.p. Clyde sidecar) had to retire owing to a collision with one of the many gates encountered *en route*.

Only the following competitors were up to time at each control and lost no marks: T. E. Davis (3½ h.p. Clyde), F. H. Fritchley (3½ h.p. P. and M.), J. McCallum (3½ h.p. King Dick and sidecar), and W. Trefz (3½ h.p. Clyde).



(1) F. H. Fritchley (P. & M.) on Vilgoe Pass.

(2) On the road to Villiersdorp. W.H. Eastoe (7 h.p. Indian sidecar) has to slow down for an obstruction.

(3) T. E. Davis (3½ h.p. Clyde) charges the watersplash at speed.

TWO-DAY RELIABILITY TRIAL AT THE CAPE.

OCCASIONAL COMMENTS

BY "IXION"

My Quest for a Waterproof Glove.

I can now add the names of two more waterproof gloves to that of the stiff, heavy, Asbestol hide, which stood by itself in my first note on the subject. One of these has a waterproof back, and is made by John Glover Nicol, Ltd., Worcester. This glove has a soft leather front and a backing composed of a stiff waterproof hide. It serves its purpose well, and its only weakness is that the two grades of skin do not combine specially well together, the heavier grade showing a tendency to part from the lighter grade at the seams in very prolonged wear; of course, the front of the palm and fingers are liable to get wet during repairs by the roadside in the rain.

The other glove is covered on the back with a waterproof fur, known in the trade as "hair-seal," and is costly—21s. per pair—but it is probably the nearest approach to a really comfortable rainproof glove on the market.

Tyre Holes under Patches.

I was talking last week to one of those economical stalwarts who retain the same machine for several years, and run their tyres to destruction. He astonished me considerably by finding fault with the super-excellent patches and solutions which have come into vogue of recent years, and enable a motor cyclist to effect repairs by the roadside which are almost as satisfactory as vulcanisation; in fact, he implored me to warn men who, like himself, keep a machine for several years, from using these first-class tyre repair kits.

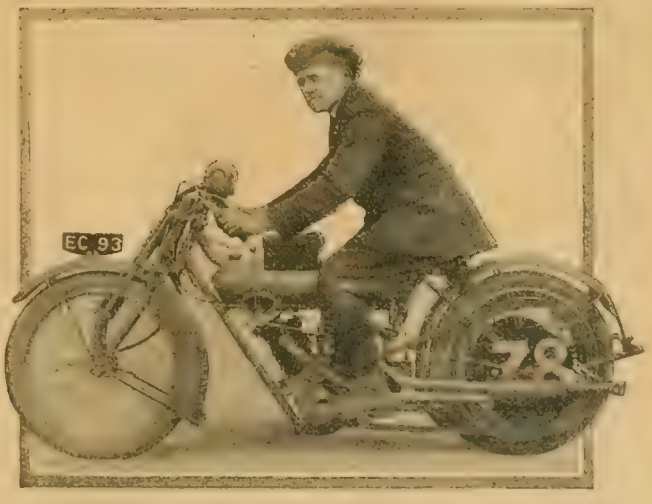
His experience is that the original puncture splits and stretches and extends under the tightly fixed patch until it reaches the edge of the patch, when a fresh egress of air takes place. The original patch is so closely incorporated with the tube that its removal is next to impossible, and it is very difficult to affix one patch on the top of another so as to obtain an air-tight joint.

I ventilate this surprising criticism without prejudice. I do not keep my machines long enough to possess the exact kind of experience requisite for a sound opinion, and my work precludes my using tyres I cannot trust. I can go with him in voicing the extreme difficulty of removing a modern patch. Lifting an edge with petrol, and gradually pulling off the patch by squirting petrol into a gap opened between it and the tube, usually results in a ripped tube—so much is certain. But I do not see why the original hole should split and stretch under the patch, if the patch is properly applied. I can understand its doing so if only the outer portions of the patch are united with the tube, but I have often made such repairs, and later on cut the tube clean through the patch to discover that tube and patch were practically coagulated into one solid mass of rubber.

I am strongly inclined to suggest that my friend does not affix his patches over their whole area, but perhaps a few readers who habitually run tubes to destruction will send their experiences to the Editor?

American v. English Machines.

One of our readers endorses my comment on the dominant position of British machines, but counters with a request for a frank admission that British machines are hopelessly out of date in point of specification. He is evidently an enthusiast for the red Indian, for he demands to know why none of the leading British machines possess 28in. × 3in. tyres, mechanical oiling, rear sprung frames, etc., etc. The answer is quite simple. The Hendee Co. produce a very expensive machine, and hold strong and peculiar views on the question of the ideal specification. The average British maker produces a cheaper machine and holds quite different views on the subject of an ideal specification. Popular as the Indian is, it makes no pretence to oust our leading machines from their present and increasing popularity, which shows that many British users are content with hand oiling, 2¼in. tyres, and rigid rear frames. There is plenty of room for all the existing types. My regular readers are aware that I completely agree with the Hendee Co. in believing that every first-class machine should be rear sprung and mechanically lubricated, but I personally do not consider large tyres an advance; I would rather have a strong 2¼in. tyre than a 3in. any day. In fact, I should imagine that the 3in. tyres of the Indian must be ascribed rather to the extreme badness of the American roads, for which the machine was primarily designed, than to any genuine advantage on such roads as ours.



R. Bowniss on one of the new T.T. model semi-dropped-frame Matchless machines which allow an extremely low saddle position. The new control lever for the Armstrong three-speed gear is plainly shown.

Occasional Comments.

Noisy Exhausts and their Cause.

I confess to being rather thick-headed. A series of long trials has brought me a dawning comprehension of the real reason why some motor cycles are so noisy. The bark of a semi-silenced exhaust is necessary to drown a smother of minor mechanical noises arising from faults in design. These noises would be intolerable to the rider if they were allowed to be separately audible. I made my tardy discovery by fitting a first-class silencer to one of the worst offenders. I converted its exhaust into comparative silence, and found there was no perceptible back pressure; but, *per contra*, my offended ears were saluted by a perpetual mutter of minor clackings from the timing gear and valve rockers, and a kind of hoarse grinding from the change-speed gear box. The clear bark of the exhaust was infinitely preferable to the other noises, and I think I shall remove the efficient silencer, unless I can trace the real cause of the valve and gear noises and eliminate them first.

Belt Drive for Speedometers.

Some weeks ago I commented on the new American model of the Stewart speedometer, which has a belt drive from the front hub to a small pulley mounted on a special bracket bolted or brazed to the front fork, and a similar belt from the counter-shaft to the speedometer itself.

The belts are made of coiled steel piano wire, and they run on steel and fibre pulleys. It is claimed that the abolition of gearing reduces noise, that the friction of a flexible shaft running within a sheathing is abolished, and that the drive automatically adjusts itself to every vibration and road inequality. A test would be necessary to convince me that the change is an improvement, but I admit that the existing speedometer transmissions entail more friction, sustain more wear, and create more noise; yet I should think that the encased shaft drive is the more accurate.

The Trumpet Valve.

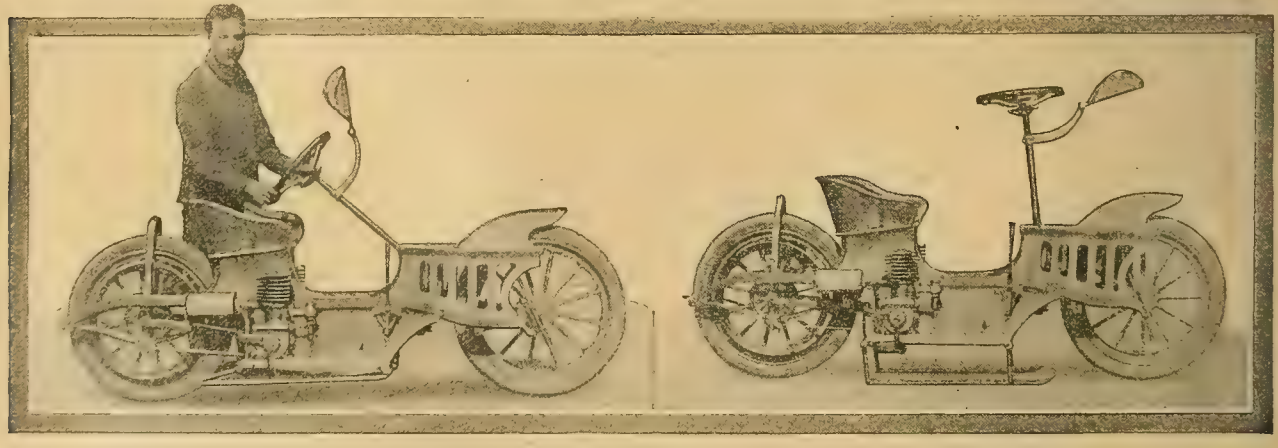
I must leave "L.M.M.J." to reprint any portions of his letter referring to the size and material of his "trumpet" design for an overhead valve, for his letters have long since gone into the w.p.b. I hope I have not misrepresented him, but am unable to judge unless he produces his copy of the letter in question. On the main question as to the merits of the design we must evidently agree to differ, and it is a point in my favour that the firms who experimented with a less extreme form of the principle appear to have abandoned it. It would be interesting to hear what firms, if any, are persisting with it? "L.M.M.J." and Mr. Walford, who approves the valve, are both engineers of high standing, and a mere layman naturally feels some diffidence in contesting a point with them; but my dislike of the valve would be converted into deep interest if the head were not open. Manufacturing difficulties would obviously have to be reckoned with, especially in view of its small size as applied to motor cycle engines; but, omitting for the moment manufacturing considerations, a valve of this type possesses all the possibilities of "L.M.M.J.'s" original design, and is strong just where the original valve is weak. However, if the design has been found wanting in a modified form, there is little use in protracting a discussion about it.

A CAR CYCLE.

A SOMEWHAT unusual type of two-wheeler combining a number of ingenious devices is that built by a resident of Los Angeles and illustrated on this page.

The machine has a steel frame, sprung fore and aft. Wheel steering is employed, to the pillar of which is fitted a detachable wind screen. A clever device for balancing the vehicle when not in use is fixed underneath the footboards. This consists of two skids, one on either side, which, as soon as the driver takes his seat and starts off, are gradually raised by pressure on the steering wheel.

The motive power is by two 4 h.p. two-stroke single-cylinder engines (bore and stroke 3in. × 3in.), from which the power is transmitted to the rear wheel through a multiple disc clutch and two-speed gear. We understand that another seat or luggage carrier may be fitted over the rear wheel if desired.



A NOVEL AMERICAN MOTOR CYCLE—ALMOST A CAR ON TWO WHEELS.

THE A.C.U. Six Days' Trials.

AUGUST 18th to 23rd.

SUMMARY OF PRELIMINARY REGULATIONS.

Main Innovations: Flexibility and Speed Tests.

A Five Days' Prolonged Trial of 700 Miles. "Non-stop" Days. Spare Parts to be Sealed.

THE basic idea underlying the conditions of this trial is that it shall be a prolonged test and a demonstration of reliability and efficiency, and not, as has been the case annually since 1903, a series of daily tests. That is to say, if it were not impossible on account of the physical limitations of the drivers and the fact that the trial could not be run altogether in daylight, the proposal would be to cover the whole distance of the trial without any voluntary stops.

General Conditions.

The trial proper will occupy five days, the sixth day being devoted to a technical examination of the competing machines. Certain of the five days will be "non-stop." That is to say, stops will not be permitted except at the official controls. On these days a short period of time will be allowed in the morning during which competitors may lubricate or adjust their machines, but on other days no such time will be allowed, and if in certain cases such preparation is unavoidable the time so occupied will count against the competitor. Any spare parts considered necessary must be carried throughout the trial, and arrangements will be made whereby, if use is made of such parts, the fact will be recorded and will count against the competitor.

Flexibility and speed tests will be held during the course of the trial.

Component parts will not be specially tested this year as was the case last year with tyres and belts, but careful examination will be made at the end of the trial of the competing machines, and notice will be taken during the trial of the appearance both of machine and rider.

Lady competitors will be barred. Manufacturers will be limited to three entries each.

The District.

The country selected for these trials is comprised within a radius of 100 miles of Carlisle, and embraces what is undoubtedly the most beautiful and the most hilly district to be found in England. In selecting the routes care will be taken to provide as varied conditions as possible, but hill-roads having an abnormal surface, or where the road is not of reasonable width or is dangerous, will not be included. The routes will start from and return to Carlisle each day, but the daily mileage will be somewhat less than in previous years, and the total mileage will probably not exceed 700 miles. On one afternoon the competing machines will be required to cover a certain distance on a private road, at speeds in excess of 20 miles per hour, different speeds being set for each class of machine. The actual routes will be published during the first week in August.

International Touring Trial.

The Fédération Internationale des Clubs Motocyclists, having decided to promote annually a competition amongst the various countries composing the Federation, have chosen this trial as the first of the series.

The members of the teams entered for the International Trial will be subject to all the regulations that govern individual competitors. The number of teams that may be entered by each country is limited to one, and such team shall consist of three competitors, each of whom must be a subject of the country represented. Each team shall comprise one passenger machine (either a motor bicycle not exceeding 1,000 c.c., with sidecar, or a three-wheeled cycle car not exceeding 1,000 c.c., or a four-wheeled cycle car not exceeding 1,100 c.c.); and either two 500 c.c. motor cycles, or one 500 c.c. motor cycle and one 350 c.c. motor cycle.

The entrants of the winning team in the International Touring Trial will be entitled to hold for one year, under terms of an agreement, the International Trophy presented by the Cycle and Motor Cycle Manufacturers and Traders Union, Ltd. This trophy consists of a handsome silver cup, value 200 guineas.

Entries.

Entries will be received by the Union at 89, Pall Mall, London, S.W., up to mid-day Wednesday, August 6th.

SCHEDULE OF ENTRY FEES.

Entries from manufacturers and riders in their employ	£6 6s. each entry
Entries from agents and riders in their employ	£4 4s. each entry
Other entrants	£3 3s. each entry
For a nomination of a team in the International Touring Trial, open only to the representative clubs of countries in the F.I.C.M.	£5

DECLARATION TO BE SIGNED BY ALL ENTRANTS AT THE £3 3s. SCALE.

"I hereby declare that I am not now, and shall not be at the date of the proposed trial, either (*a*) a manufacturer of, agent for, or dealer in motor cycles, (*b*) in the employ or pay of any such person or company as described in (*a*) and defined in preliminary regulation No. 3."

Classification and Equipment.

A motor bicycle is defined as a vehicle comprising a frame, two wheels, and suitable engine. Motor vehicles with more than two wheels and weighing without body work less than 300 kg. (660 lbs.), or in the case of those vehicles the body of which is not separable from the chassis, less than 350 kg. (771 lbs.) complete, are included within the term motor cycle.

All motor cycles taking part in these trials must conform to, and will be classified under, the following divisions and classes:

DIVISION 1.—Motor bicycles.

Class.	Cylinder capacity not exceeding	Minimum weight without oil or fuel.	Minimum diameter of tyre (cover and inner tube separate and detachable).	Nearest English equivalent.
A	250 c.c.	40 kg. (88 lbs.)	45 mm. (1¾in.)	
B	350 ,,	50 ,, (110 lbs.)	50 ,, (2in.)	
C	500 ,,	60 ,, (132 lbs.)	55 ,, (2¼in.)	
D	750 ,,	70 ,, (154 lbs.)	60 ,, (2⅜in.)	
E	1,000 ,,	80 ,, (176 lbs.)	65 ,, (2 9/16in.)	

DIVISION 2.—Motor cycles with three wheels (motor bicycles and sidecars and three-wheeled cycle cars).

F	350 c.c.	80 kg. (176 lbs.)	50 mm. (2in.)	
G	500 ,,	100 ,, (220 lbs.)	55 ,, (2¼in.)	
H	750 ,,	110 ,, (242 lbs.)	60 ,, (2⅜in.)	
I	1,000 ,,	120 ,, (264 lbs.)	65 ,, (2 9/16in.)	

Nearest English equivalent.

All vehicles in Division 2 must be fitted with a clutch.

DIVISION 3.—Motor cycles with four wheels (four-wheeled cycle cars).

J	750 c.c.	150 kg. (330 lbs.)	50 mm. (2in.)
K	1,100 ,,	175 ,, (385 lbs.)	60 ,, (2⅜in.)

SPECIAL CLASS.—Single-seated motor cycles with three or four wheels.

1. 1,000 c.c. Three-wheel single-seated cycle cars.
2. 1,100 c.c. Four-wheel single-seated cycle cars.

All vehicles in Division 3 must be fitted with a variable speed gear.

The A.C.U. Six Days' Trial.—

All vehicles in the Special Class must be fitted with a variable speed gear.

All vehicles in Divisions 2 and 3 must be built to carry two passengers, and both seats must be occupied throughout the trial. The minimum weight of each driver or passenger in these vehicles is fixed at 60 kg. (132 lbs.). This weight may, if necessary, be made up with ballast.

All vehicles must be equipped as follows: Two independent brakes, a set of tools and receptacle therefor, mudguards projecting at least 10 mm. ($\frac{7}{16}$in.) on each side of the tyres and covering at least 120 degrees of the circumference of the wheels, one or more petrol tanks with a minimum capacity of 5 litres (8.8 pts.) one or more oil tanks with a minimum capacity of 1 litre (1.76 pts.) and a complete set of lamps.

In addition to the above, motor bicycles must be fitted with a stand and luggage carrier, the latter having an available surface of at least 600 square centimetres (93 sq. in.).

Spare parts must be packed in a separate receptacle, and the contents thereof declared in writing on forms that will be supplied for the purpose. These receptacles will be sealed.

All competing machines will be weighed, and the frames, engines, and gear boxes will be sealed

The diameter of the driving wheels and the gear ratios of every motor cycle shall be stated on the entry form, and will be published. Should the ratios be indefinite, as in the case of motor cycles fitted with adjustable pulleys, the highest and lowest ratios obtainable shall be stated.

Number plates, facing forward and vertical, must be fixed to the front of the machine, on a special bracket to be provided by the entrant to enable the number plate to be set in such a position as to be clear of all front obstructions. The plates, which will measure 7½in. × 6in. deep, will also be supplied to each competitor, and competitors will be held responsible for the numbers being properly fixed at all times. Motor bicycles or cycles entered for the International Touring Trial must be equipped as follows:

(a) Front number plate (in accordance with the above).

(b) Coloured disc displaying the colours allotted to the respective competitors (in accordance with the rules of the F.I.C.M.).

Organisation and Control.

In the flexibility and speed tests the maximum number of marks will be one hundred.

On those days on which the route is to be covered "non-stop," stops will be permissible in certain sections and controls only. A stop at any other point on these days will involve a loss of four marks.

A maximum of ten marks may be lost on account of the defective condition of any competing machine as may be decided by the Judges during the final examination

The order of starting on the first day shall be decided by ballot, and on subsequent days the order shall be varied so that the average position of each competitor at the start of each day's run shall be so far as possibly the same.

No cleaning, repairing, or adjustment may be effected in controls. Replenishments of petrol, oil and water may be made only at the official starting depot or during the luncheon interval.

Motor cycles must be driven under their own power only throughout the trial. All pedalling or running alongside is prohibited, as is kicking on the ground for the purpose of propulsion. Passengers must remain seated in a normal manner throughout the trial.

Awards.

A certificate will be awarded to the entrant and a gold medal to the driver of all those motor cycles which gain a total number of marks as follows:

Division 1.—Ninety per cent. of the total marks and over.

Division 2.—Eighty-five per cent. ditto.

Division 3.—Eighty per cent. ditto.

Special Class.—Ninety per cent. ditto.

A certificate will be awarded to the entrant and a silver medal to the drivers of all those motor cycles which gain a total number of marks as follows:

Division 1.—Seventy-five per cent. and not more than eighty-nine per cent. of total marks.

Division 2.—Seventy per cent. and not more than eighty-nine per cent. ditto.

Division 3.—Sixty-five per cent. and not more than seventy-nine per cent. ditto.

Special Class.—Seventy-five per cent. and not more than eighty-nine per cent. ditto.

A bronze medal will be awarded to each driver who does not obtain any other award but who completes the trial each day within one and a half hours of the schedule time with his machine in good condition, and who has otherwise fulfilled all the conditions of the trial.

THE THIRD INTERNATIONAL ROAD CONGRESS.

The Third International Road Congress opened in London last week. The A.C.U. representatives are Mr. A. Sharp, A.M.I.M.E., and Mr. F. Straight.

The following resolutions proposed by Prof. Adshead, of Liverpool University, are of interest to motor cyclists:

New main roads should pass outside rather than through towns.

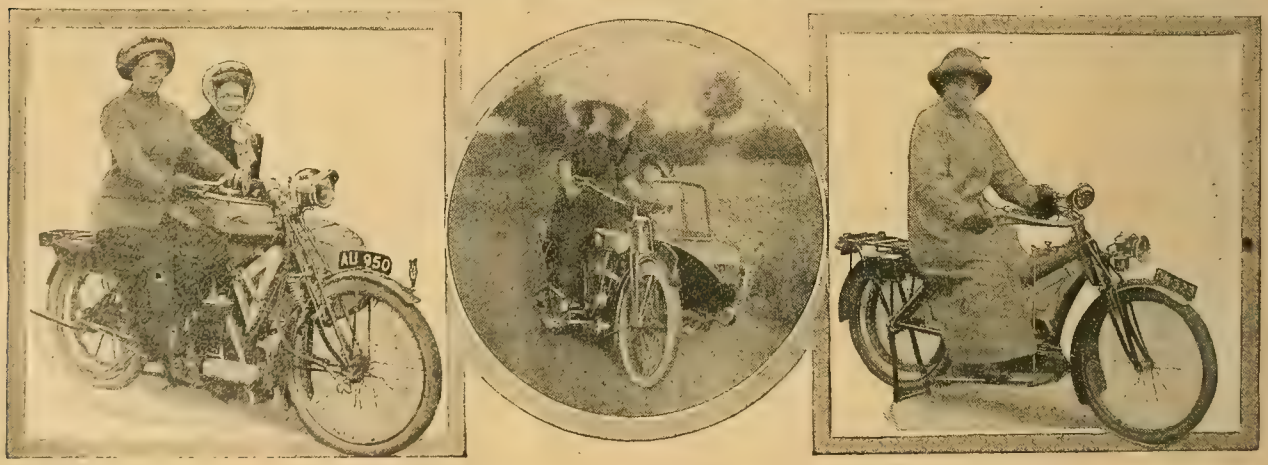
Gradients should be limited to 1 in 20.

An unobstructed view of 100 yards should be provided in the case of curves.

Main traffic roads to be so designed that fast and slow traffic can proceed without intermixing.

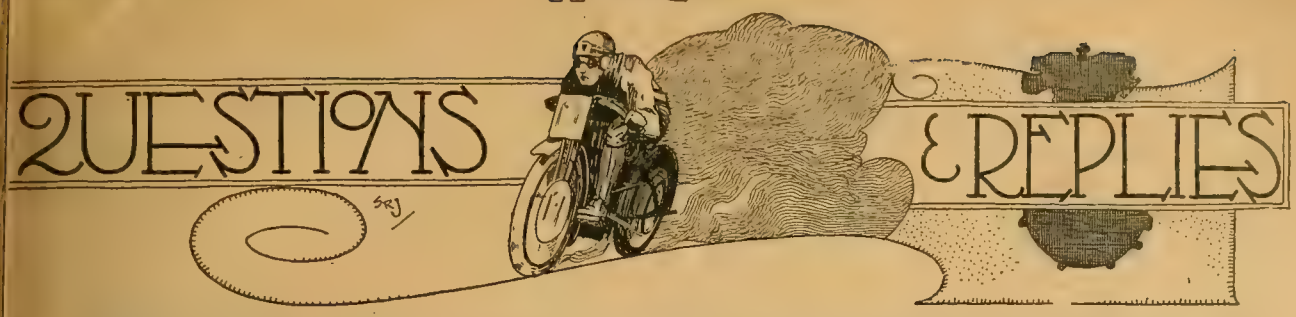
Some initiative should rest with a central State authority which could supervise local authorities.

Mr. John Brodie, chief engineer of Liverpool, suggested that where houses were not built the roads should be of not less than 120ft. in width.



MORE LADIES WHO MOTOR CYCLE.

(1) Mrs. Wilson and her 3½ h.p. Brough sidecar. The passenger is Mrs. W. E. Brough of Nottingham. (2) Miss Kornig of Johannesburg and her 750 c.c. Rudge sidecar which she handles with ease. (3) Miss Ella Wright (Douglas), a cross-country rider in all weathers between Ingham, near Bury St. Edmunds, and Appleton, a distance of fourteen miles.



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Running on Paraffin.

When running a modern motor cycle on paraffin, is it necessary to lower the compression?—W.J.W.

It is not necessary to lower the compression, but it is necessary to use a device which will enable the engine to be started on petrol. After the engine is warm, it can be run with paraffin.

Birmingham to Kilmarnock.

I should be glad if you could advise me regarding the best route to take from Birmingham to Kilmarnock (N.B.) Our mounts are free engine Triumphs.—Two Sparks.

The route would be as follows: Birmingham, Sutton Coldfield, Lichfield, Rugeley, Weston, Stone, Pipe Gate, Nantwich, Tarporley, Warrington, then by the road signposted by the R.A.C. *via* Rainhill, Prescot, Rainford, Ormskirk, Rufford, to Preston, Kendal, Penrith, Carlisle; then go through Dumfries, Thornhill, Sanquhar, Cumnock, to Kilmarnock.

Valve Setting.

I shall be greatly obliged by your answers to the following questions: (1.) What setting of the valves gives the highest speed? (2.) What is a fast timing for the magneto? (3.) If a lighter piston is fitted temporarily, is it necessary to drill the flywheels to preserve the balance of the engine? My machine is a Triumph.—B.H.H.

(1.) There is no hard and fast rule for valve setting; practically every maker's setting is different. With your particular engine, the inlet should be set to open when the piston is about $\frac{3}{16}$in. down on the suction stroke. The exhaust should be set to commence to open from three-fifths to $\frac{7}{8}$ths from the end of the firing stroke, and should be dead on its seat at the completion of the exhaust stroke. (2.) We do not think you will improve on the following setting for the magneto. With contact maker fully retarded and piston on dead centre of firing and compression stroke, the contact points should be just about to separate. (3.) To obtain the very best results if a lighter piston be fitted, some slight alteration would be necessary in the balancing of the flywheels to preserve the balance of the engine. If you only want to make an experiment, it would not be advisable to interfere with the flywheels, but to try the lighter piston alone.

Calculating Gear Ratios.

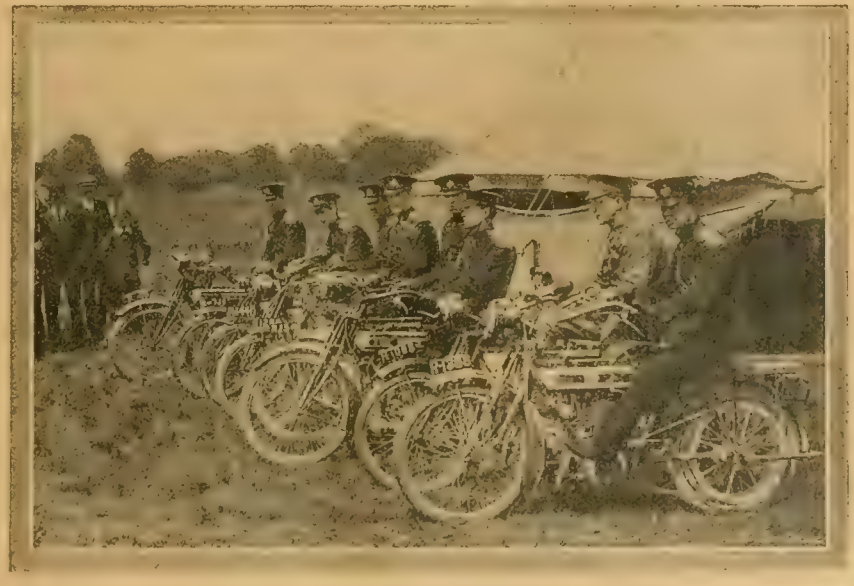
Would you kindly answer the following questions: (1.) Do you recommend fitting a steel piston to an old $2\frac{3}{4}$ h.p. engine; is it likely to give any trouble in any way? (2.) Is there any advantage in fitting an oil well for the piston to dip in every time it descends in the cylinder? (3.) I propose fitting a chain drive to my machine. How can I calculate the gear ratio, so as to order the different sprockets with the right number of teeth to get a certain gear? The drive is from the engine-shaft to the clutch, then from the counter-shaft sprocket to the rear wheel. (4.) I have been advised to have the engine bushed with Stone's bearings, the same as used on railway locomotives. Is this the best phosphor bronze obtainable; do you recommend it?—A.B.

(1.) Provided the work is properly done and the steel piston made by a reliable firm, it will not give any trouble, and may increase the speed of the engine owing to its lighter weight. (2.) The oil well is certainly an advantage, and should not be cut away if already fitted to the engine. (3.) The following rule will give you the gear ratio. Multiply the number of teeth on the driven sprockets; also multiply the number of teeth on the driving sprockets, and divide the smaller figure into the larger, which will give you the ratio. For instance, with 8 teeth on the engine sprocket and 8 on the counter-shaft = 64; 16 on counter-shaft and 16 on rear hub = 256. Gear ratio, 4 to 1. (4.) We have no practical experience of the bearing metal mentioned in your letter, but phosphor bronze suitable for bushing bearings of motor cycle engines can be obtained from various firms.

Portsmouth to Harrogate.

Will you kindly tell me the best route from Portsmouth to Harrogate (without touching London)? As I wish to take two days, which is the best place to stop the night?—G.L.C.

Your best route would be as follows: Portsmouth, by ferry to Gosport, Fareham, then through Winchester, Newbury, East Ilsley, Oxford, Brackley, Towcester, Northampton, Kettering, Stamford, Grantham, Newark, Tuxford, Retford, Doncaster, Ferrybridge, Aberford, Wetherby, Spofforth, Harrogate. You might stop the night at Towcester.



A group of members of the motor cycle section of the Derbyshire Imperial Yeomanry, in camp at Hardwicke, Derbyshire.

Cubic Capacity Formula.

Would you kindly let me know how to calculate the cubic capacity of an engine?—W.C.H.

The formula for cubic capacity is $D^2 \times S \times .7854$. The dimensions must be in centimetres, not millimetres. You can obtain from *The Motor Cycle* a table giving the cubical capacity of engines up to 90 × 100 mm., price 3d.

A Noisy Engine.

I have an 8 h.p. two-speed sidecar. My trouble is this: The engine pulls well, but makes a terrific noise even when pedalled to start. I have taken it down and find that the connecting rods have been running against the flywheels, and that the gudgeon pin bushes have a lot of side play, and the valve rockers have been touching one another and the inside of timing case. Also, the rockers have some ridges worn on the working faces. The main bushes and timing bushes are all right, except that there is some side play in main shaft. I can move the shaft and flywheels, etc., about $\frac{3}{32}$in. from side to side, and this clatters when running down hill with throttle closed. Should I washer it up? Also, inside the cylinders, at bottom of stroke, there is a slight ridge formed. Would this account for the noise; and shall I scrape this? Compression is good. Also, there is a slight ridge at the top of the stroke; does this matter, as I do not think it bad enough for new pistons to be fitted, since engine pulls well? I have sent flywheels, rods, and pistons to be rebushed; although gudgeon bushes were not bad, there was a lot of rocking play in big end bush. The front cylinder is inclined to overheat, so I am cutting away the front baffle plates from the crank case, so that more oil can work into the cylinder. I use Price's Motorine, with a Best and Lloyd lubricator sight feed. I can hardly describe the noise. It is generally noisy and almost so loud as to enable me to dispense with a horn. Altogether it seems to have a shaky, loose noise, as if every part was loose; but the bushes are all right in timing case, and the cam gears do not mesh too tightly.—R.E.B.

Certainly it matters if the connecting rods are rubbing up against the flywheels, and you should take the machine to the makers and have it put right without delay. Side play in the gudgeon pins does not matter at all. It does not seem right, however, that the valve rockers should touch one another and the sides of the crank case, or that there should be any ridges worn on them. Side play does not matter at all; it is vertical play that you have to look for. If the ridges at top and bottom of the cylinders are bad, the cylinders should be ground out and new pistons fitted. These ridges frequently cause engine knocks which are not easily accounted for. It would have been better if you had sent the whole engine back to the makers, as they would then have seen that it was assembled correctly. You are certainly wise to cut away the front baffle plates a little from the crank case so as to let more oil work into the cylinder.

Petrol Level at the Jet.

Would you kindly advise me as to the correct level of petrol in the Amac carburetter (five-hole sprayer pattern)? My machine, a 6 h.p. twin-cylinder, would check every few yards when running at slow speed. After trying everything else, I looked at the level of the petrol in the jet, and found it overflowed freely, as set by the makers. I lowered the float as far as it can safely go, but without stopping the overflow, and find there is loss of power. The books all say that the petrol should not overflow at the jet. Does this make of carburetter require a special setting?—A.A.G.

In the Amac carburetter, it is correct for the petrol to overflow the main jet, but not the five spraying holes. The Amac Co. supplies a special test jet with every carburetter for testing the level. Probably the cause of the checking to which you refer is an air leak in the induction pipe, or perhaps you are giving too much air at slow speed.

Horse-power and Hill-climbing.

There is a question I should like to ask you with regard to the power of motor cycles. Take a hill, say, one mile in length, with a total rise of 100 feet. Now take a lightweight motor cycle, 2½ h.p., weighing, say, 150 lbs., and its rider at, say, 150 lbs., making a total of 300 lbs. Now take this cycle and its rider up this hill at 30 m.p.h. and see what horse-power is required to do the job. $\frac{300 \times 100}{33{,}000 \times 2} = .454$ h.p., say, ½ h.p. Allow, say, another 100% for wind resistance, transmission losses, etc., which brings the total h.p. required up to 1 h.p. What becomes of the other 1½ h.p.? Have I missed an important factor in my calculations?—G.E.

The hill in your example is a very slight one, being only about 1 in 53. Your figures are quite correct as far as hill-climbing is concerned. If you refer to our issue for March 27th, you will find the air resistance given for 30 m.p.h. at 13½ lbs.; this consumes another 1.08 h.p. Road resistance at 60 lbs. per ton (which it would be on a good dry road) accounts for another .64 h.p., giving 2.17 h.p. in all. So the engine should be working well within itself, and unless running at its critical speed should be capable of some further acceleration.

Speed Limit for Military Motor Cyclists.

I am a military motor cyclist, and was on duty recently when I was accosted by a constable, who said that I was exceeding the limit. I pointed out to him that there was no limit when in uniform, but he denied it. He then said that he could have me up for driving to the danger of the public. I again pointed out that I was on duty, and passed on. Now, I shall be very much obliged if you can give me the definite ruling on this point, as of course I do not want any unpleasant circumstances to arise when on duty.—H.V.T.

There is just a possibility that when your case comes up before the magistrate, he will let you off on the plea of extenuating circumstances, especially if your commanding officer had ordered you to travel as quickly as possible between one town and another. The mere fact that you were in uniform does not absolve you from keeping within the speed limit.

EXPERIENCES WANTED.

"H.R.S." (Stroud).—Lincoln-Elk two-speed; efficiency and reliability with and without sidecar.

"W.L." (Edinburgh).—Bowden two-speed gear fitted to 4 h.p. single-cylinder machine for sidecar and solo work; wear of mechanism, etc.

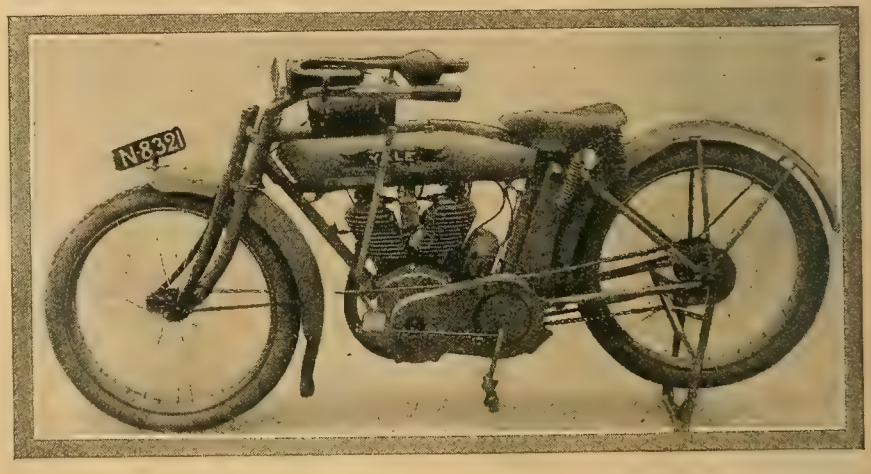
"E.R.P." (Manchester). — Mabon variable gear and free engine; ease of manipulation, reliability, and wear.

"Puzzled" (Forest Hill).—A.J.S. 6 h.p. and sidecar, also 5-6 h.p. F.N. and sidecar; reliability, hill-climbing, and consumption.

"W.S.W." (Enfield).—2¾ h.p. 1911 Forward; hill-climbing, steadiness on grease, traffic riding, and reliability.

"H.S." (Kidderminster).—A.B.C. twin engine; reliability, hill-climbing, and speed.

"H.P.M." (Ballymena). — Shippey's decarboniser for air-cooled engines.



The 8 h.p. twin-cylinder Yale—an American mount owned by W. E. Ayres of Manchester. We are told by the owner that the machine is most comfortable, especially at high speeds. Senspray carburetter, chain drive, and 28in. × 3in. tyres are fittings worthy of notice.

Slowing Down the Senior Tourist Trophy.

By B. H. DAVIES.

THERE is a considerable divergency of opinion as to whether steps should be taken to reduce the speeds in the 1914 Senior T.T. The idea was mooted before the competitors and officials left the Isle of Man after this year's race, and it has since received considerable attention in the sporting papers. There is a vague but widespread impression that the race is becoming too dangerous, and that restrictions are desirable in the interests of safety.

Proposed Restrictions.

The various suggestions made include the following:

1. The elimination of the less skilful riders by making the race an "invitation" event. (This would have little effect on the actual race, but would reduce the number of casualties during the preliminary practising.)

2. The reduction of the present cylinder capacity limit of 500 c.c. to some smaller figure. (This would certainly be a blunder, as the 500 c.c. engine is the most popular type at present, and it should be the function of the premier speed competition to develop the dominant types of engine.)

3. The insistence upon all competitors covering a certified number of laps in the preliminary practice, the number of laps to depend upon their past experience. (This would probably have a very limited effect upon the safety of the actual race. I have seldom heard of one rider steering to the danger of another during the race itself. Nor would it eliminate the usual crop of minor smashes, due to riders who are fresh to the course travelling too fast on their initial practice laps. But it would be of some service, in that it would ensure all riders acquiring a fair acquaintance with the course.)

4. A fresh course. (A shorter course is impracticable with large entries, and the men themselves prefer the variety of a long course to the hypnotic monotony of a short course. If the course is long, it will be safer in proportion as it is familiar.)

5. Safeguarding the present course. (The institution of slow speed controls is obviously impracticable. Dangerous points would be safer if the warnings consisted of broad coloured streaks of tar or paint across the road. When a competitor is crouching and watching a rival ahead, he may miss the overhead banner. It has been suggested that riders should be encouraged to use speedometers, and to note in practice the precise speeds at which dangerous corners are negotiable. It is a well-known fact that few men can judge speed when they are slowing down from racing gait; 25 m.p.h. feels like 5 m.p.h. when you have just been doing 60 m.p.h.)

6. The reinstitution of a fixed petrol allowance, calculated to prevent 500 c.c. engines being run at their full efficiency. (This is certainly the only practicable method of securing a slower race for 500 c.c. engines.)

I am personally inclined to question whether any reasonable revision of the regulations can appreciably increase the factor of safety. As a matter of fact, the speed of this race is not increasing to any perceptible degree. Applebee's five laps in 1912 occupied four minutes less time than Wood's first five laps of 1913; and Applebee averaged 48.69 m.p.h. over five laps, as against Wood's 48.28 m.p.h. over seven laps. The winner's speed in the Junior event was a good 4 m.p.h. faster this year than last, a gain which is largely explained by the better road and weather conditions. Figures seem to show that the limits of speed fixed by the roads and by the engine dimensions have already been reached in the Senior event.

Speed and Safety.

If the Senior event is more dangerous than it was in 1912, the increased danger arises from the tendency of the various machines to be levelled up, largely ascribable to the work done at Brooklands; to the fiercer competition due to the large entry obtained when the trade support the race; and to the increased liability to tyre troubles resulting from an extension of the distance. Not one of these conceivable danger factors will be perceptibly affected by petrol restrictions. Indeed, the time margins between the leading men after the opening laps are likely to be even smaller if the supply of fuel is limited, for it is much easier to procure petrol economy than to coax an extra 300 effective revolutions out of an engine. If the danger has increased, the chief factors are surely as follows:

(1.) Closer racing.
(2.) A larger entry.
(3.) Increased tyre strains.

I cannot see that petrol restrictions will affect these points at all materially.

THE FIRST CYCLE CAR FOR NEWFOUNDLAND.
An 8 h.p. Humberette which is to be used in St. John's by the Rev. G. R. Godden who anticipates it will be of great service to him in his duties, as well as for shooting and fishing expeditions.

Slowing Down the Senior Tourist Trophy.—

The close racing cannot be avoided, nor would any sportsman wish to see it avoided. The large entry might be reduced by making the race an invitation affair; this system would place the responsible officials in a very invidious position. Who is to decide whether any given individual is a qualified T.T. jockey? The T.T. is not on all fours with Brooklands, and some of the best track men are outclassed on the Manx course, while others, who have shone in the island, dislike Brooklands. Moreover, on any system of discriminating between entrants, both Bateman and Surridge, the only two men whose deaths were incurred through the T.T., would certainly have been admitted because they were crack Brooklands jockeys. Raising the entry fees is the simplest method of reducing the number of starters; an alternative method would be to forbid any maker to be represented in the race by more than three or four machines, and to allow him to decide whether any amateurs, and if so, which amateurs, should ride for him.

Tyres—A Suggestion.

The increased tyre strains, to which the one fatality of 1913 and several of the minor accidents were directly due, will be much easier to deal with. We cannot ensure that the tyres employed shall be burst-proof, but we can make regulations as to tyre sizes and weights. If we compel entrants to use a really strong and heavy casing in conjunction with security bolts as suggested by *The Motor Cycle*, it will be to their own interest to fit the best. Alternatively, it would not be difficult to compel all riders who survive the first day's racing to fit new tubes and covers for the concluding laps. If the two days' racing are separated by a twenty-four hours' interval in 1914, we could trust Mr. Loughborough to organise matters so that the tyre fitters could change the tyres without anything else on the machines being touched.

The end and conclusion of the whole matter is that motor cycle racing is a dangerous game, and that, whatever the regulations, and however careful the surveillance, there is bound to be a certain small percentage of serious accidents. The percentage is very little larger than that of hunting or football or push-bicycle racing or any other dangerous sport. Any motor cyclist who exceeds fifty miles an hour under any circumstances is taking his life in his hands, and complete safety is not practicable. The compulsory use of pneumatic helmets is certainly desirable.

These notes are intended to show that there is no justification for panic, that the T.T. Races are about as safe as ever they were, and to indicate one or two directions in which the margin of safety might be fractionally increased.

The Anglo-Dutch Trial.

TO the English mind an international trial conveys the idea of English riders competing on the Continent, but in this case it is the reverse. Continental riders are coming over to England, and considering especially the excellent manner in which the English team were entertained by the Dutch in their own country last year, it behoves us to entertain our Dutch *confrères* to the best of our ability. Subscriptions to the entertainment fund are coming in well, but more money will be needed, and contributions, however small, will be gratefully received by the hon. secretary of the trial.

Observers for the trial are also wanted. The services of Boy Scouts will be probably requisitioned, but motor cyclists who will render the A.C.U. assistance should send in their names at an early date. Their help will be much appreciated, and they will have the opportunity of viewing an exceedingly interesting competition.

An Inspection of Brooklands.

The Dutch competitors, after being entertained to breakfast at Harwich, will be conveyed to Brooklands, where lunch will be served. Here they will inspect the track at the invitation of Major Lloyd, and store their machines there in special lock-ups. They leave Weybridge at 5.25, arrive at Waterloo at 6 p.m., and then proceed to the Imperial Hotel, Russell Square, where their luggage will await them. At 7.30 p.m. they repair to the Royal Automobile Club, where they will be received by Mr. J. R. Nisbet, who will preside at the banquet which will be held at 8 p.m. On the Sunday morning they leave Waterloo at 8.50 by the train arriving at Weybridge at 9.38, and then proceed to Oxford by road by way of Windsor. All the machines must be in Morris's Garage by 7 p.m. The official hotel in Oxford is the Clarendon, Cornmarket Street.

On Tuesday, the competitors start for Coventry, *viâ* Banbury (48 miles), where they are expected at about noon. Their machines will be garaged in the Rudge running shed, and at 1 p.m. the international competitors will be entertained to lunch by Rudge-Whitworth, Ltd., and each one will receive, by the kindness of the directors, a souvenir of the occasion.

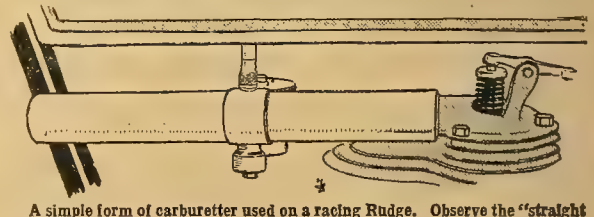
Other Arrangements.

The afternoon will be spent looking over the largest works in Coventry, although, unfortunately, it being holiday time, there will be no workmen engaged. In the evening the competitors will be the guests of the Coventry and Warwickshire Motor Club, who will entertain them to dinner. Later a cinema picture of the trial may be arranged at one of the halls.

Rear Admiral Sir R. K. Arbuthnot regrets that he will be unable to form one of the British team, as he will be away on manœuvres. In his place A. R. Abbott has been invited to ride his Rudge.

The Rudge Co. have contributed £2 2s. to the fund to entertain the Dutch riders.

The trials hon. secretary is Mr. W. Cooper, Elmcroft, Pinner Road, Harrow.



A simple form of carburetter used on a racing Rudge. Observe the "straight through" pipe which is all the carburetter consists of in addition to the float chamber.

LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Garages.

Sir,—I notice in your issue of June 19th Mr. M. G. Tweedie complains about garages generally not giving a receipt for motors left with them.

Might I ask you to spare enough space to state that we have always made a practice of giving a receipt for any motor left with us, and moreover insist on delivering a car or cycle, as the case may be, only on production of that receipt. Personally I fail to see how business could be conducted without, as this garage is open day and night, and therefore necessitates a double staff. With regard to the charge for cycle cars, I might add our standard rate is 6d. per day and night of twenty-four hours—3s. 6d. per week.

ARTHUR G. FORSTER.

The North London Garage.

Benzole.

Sir,—I have read with great interest from time to time the correspondence in *The Motor Cycle* for and against the use of benzole for motor cycles. I felt a little prejudiced against it for some time, but I am at last a convert. I have only used it for a month, but I am satisfied that there is more power from it than from petrol.

My object in writing you is to know what I am to do after reading your correspondent's letter, "Doncaster," in *The Motor Cycle* of June 19th, where he particularly emphasises the use of plenty of air. Now my experience of benzole is, of course, only short, but I find with my machine (1913 3½ Triumph and sidecar) that I cannot use so much air with benzole as with petrol; if I open out the air the result is not so good.

Is it because the jet is too small for benzole? If I were to have a larger jet so as to admit more air, would it be beneficial in any way? At present, when hill-climbing, I have to be particular about the air question; if the hill is very stiff I have to retard the air lever much more than I did with petrol; this is my only trouble, if it can be called such, and I shall be glad to hear others' experience on this matter.

I should also be glad to know whether it is at all beneficial to use a vapour jet or atomiser.

HULL.

The Transmission Question.

Sir,—I have been interested in the controversy over the transmission question, and have felt sorry for those who only get 200 to 300 miles per rubber belt. I am glad to see there are still a few riders of belt-driven machines who support "Ixion" in his allegiance to that form of transmission. I have been a daily rider, in all weathers, of a 3½ h.p. Triumph since the beginning of 1911, and during that time have got never less than 2,000 miles out of a rubber belt. Only once have I been delayed with belt troubles on the road, and that was my fault, for I left home with the belt almost pulled through. The belt was a Lyso, which had covered 2,926 miles. Seeing that this climate has a bad effect on rubber goods, I think that was a pretty good life. On my present machine, a 1912 Triumph, the original belt is still being used, a ¾in. Dunlop with smooth-rounded top, and has only been shortened twice in 2,500 miles. It looks good for some distance yet. I ride solo, so perhaps if I tried to make my machine do duty as a car by loading it with a 3¾ cwt. sidecar, twelve stone passenger and luggage, I might also have to indulge in 200 to 300 mile belts. As it is, I am a well satisfied user of rubber belt transmission. I have never tried chain transmission, but why should I?

NO DAWDLER.

Singapore.

Hill-climbing Formulæ.

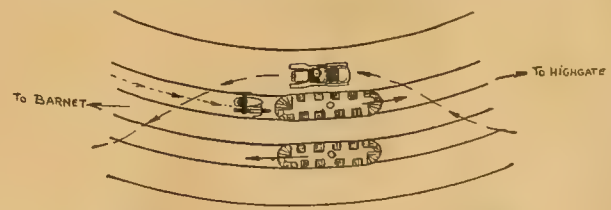
Sir,—In the ordinary hill-climb the formula $\frac{C \times t^2}{W}$ is fairly satisfactory for motor cycles, but in the case of cycle cars the conditions are very much more variable, and the use of such a formula would simply mean that a certain machine would be always bound to win on a certain hill, and it is quite clear that it would only need an adjustment of weight to secure this result, assuming it to be running fairly well. As it is very important to encourage all kinds of machines, and especially all kinds of drivers, it is desirable that machines should compete on an even basis, and as the factors in the formula are relatively variable by the length and gradient of the hill and the points at which the time-keepers stand, it is ridiculous to let each factor have the same weight on different kinds of hills. We are, therefore, using a formula with variable constants which enables this correction to be made, and which does not always mean that unless the hill is extremely short the time squared will become the controlling factor, thus giving a racing and stripped machine the whole event without the least chance of any other cycle car winning, as the weights of bodies vary so much more than do the corresponding weights of motor cycles.

This formula, which I have been at some pains to work out, will be found to produce very just results, and it gives amateurs a good chance. It is $\frac{W}{(C-K)\,T^P}$ K and P are constants, usually 200 and 1.75 respectively.

A. W. LOW, A.C.G.I., D.Sc., ETC.

A Narrow Escape.

Sir,—I should be pleased if you would find a little space in your journal for this letter and the enclosed diagram. I wish to show how recently I very nearly got smashed up on the main road between Highgate and East Finchley. I was driving a 3½ h.p. Premier and sidecar, and was proceeding up the hill behind a tramcar. I had noticed another tram coming down the hill, and also a large pair of head lights behind the tram. I knew my path lay on the near side of



Plan of road—to illustrate letter from Mr. L. Weihs.

the tram in front of me, and just as I turned in to pass the tram a large motor car, the same which I had just seen up the hill shot out past me on my near side, causing me to swerve in and hit the back of the tram. I blew my police whistle to have the car stopped, but it was away in a flash. On looking round I found I was fortunate in only sustaining very slight damage—twisted handle-bars and bent mud-guard. Several witnesses remarked what a narrow escape I had had. I cannot make out what induced the car driver to come right over the road. If any reader saw the affair and managed to get the number of the car I should like to have five minutes with that driver.

L. WEIHS, LH 1907.

Cycle Cars minus Differential Gears.

Sir,—I notice that "Ixion" suggests a solid back axle with no differential for cycle cars. I have been using one for the last six months, so perhaps my experience may be of value. The cycle car is a Violette single-cylinder, 80×140, weight about 7 cwts., friction disc and chain drive, speed on the level 20-25 m.p.h.; roads, fair surface as a rule, but bad in some places. The tyres are Michelin 650×65, "reinforced" on back wheels and "light" on front wheels. After 2,000 miles (about) the right back tyre was unsafe, so I put in an Atlas band and used it for another 600; there was then a hole right through, not a cut. I then put on a new cover, with the result that the steering became very heavy, the car pulling hard to the left. This I put right by fitting a new cover to the left back wheel and changing the old cover, which was nearly worn out, to one of the front wheels.

As regards easy steering and steadiness in grease, there is no objection to a solid axle so long as the two tyres are the same size, and this, I find, means changing both back tyres together; for the difference in diameter of old and new tyres may be as much as half an inch. But, as you will see from the figures I give, tyre wear is distinctly heavy.

REGINALD FISHER.

An Enthusiast's specially fitted up Machine.

Sir,—I enclose some photographs of a machine which I have brought quite up to date in nearly every respect, details of which might interest other N.S.U. riders and readers of your paper.

The machine is a 1912 3½ h.p. N.S.U., fitted originally with the automatic carburetter. Not being satisfied with results or power, at considerable expense I adapted a variable jet, B. and B., with marked improvement. This year I fitted the standard dual control N.S.U. carburetter, with even superior results. The great feature of this carburetter is the admission of the petrol at the top of the float chamber and all air below the jet. It is an excellent carburetter, and deserves much wider recognition. Then I added the following:

1. Bowden control lever in place of N.S.U. More handy.
2. Enots automatic lubricator. A most reliable fitment.
3. B.S.A. pattern carrier, as I often use the pillion seat, and the N.S.U. carrier was not sufficiently strong or rigid enough for this purpose.
4. Xl'All saddle. Most flexible and comfortable.
5. Clayton decompressor. To ensure easy starting on the low gear. I also removed the pedals, as they interfered with straddling over the machine when seated, and are nowadays unnecessary.
6. Square-shaped number plates. The front one Lucas V shaped.
7. Chase silencer, as the cut-out is now forbidden, and I can testify from experience that my machine is distinctly faster than it was with the old silencer fitted, even with cut-out open.
8. Bowden handle-bar control to the magneto.

Other alterations and additions have been: (1) Dunlop belt, (2) Lucas horn, (3) Nebo watch, (4) College mud shield, (5) Glad Eye electric lamp, and (6) a Lucifer dynamo (not yet sufficiently tested).

The machine suffers from weight, but it is built to last, and for reliability, especially as regards the engine. I am more than satisfied. This is the fourth N.S.U. I have had, and it is incomparably superior to any previous model.

There are two points I would like yet to adopt—(1) chain drive, and (2) more efficient mudguarding on both wheels.

For about 500 miles I have been running on benzole. I find (1) a little more difficulty in starting, (2) certainly more power with less consumption, and (3) not the slightest suspicion of knocking on any occasion. No alteration has been necessary in the carburetter.

I am very proud of my improved machine.

J. WHITTINGTON.

Cost of Running an 8 h.p. Cycle Car.

Sir,—I noticed in your issue of June 19th an account showing the expenses per mile of running an Humberette = ⅝ths of a penny. Thinking that your readers might be interested in the cost per mile of a G.W.K. over the same distance, I venture to append the following figures:

Petrol at 41 m.p.g. average	£2	16	6
Oil and grease		9	0
Repairs		5	0
Total (1,360 miles)	£3	19	6

= ¾d. per mile approximately.

The repairs consist of one puncture and a bent axle, set straight after having run into a tramcar. The tyres are Michelin, and, bar the one puncture, have given no trouble at all. The car runs well, is comfortable, and does the work previously done by a 15 h.p. car at about one-eighth the cost. Usual disclaimer.

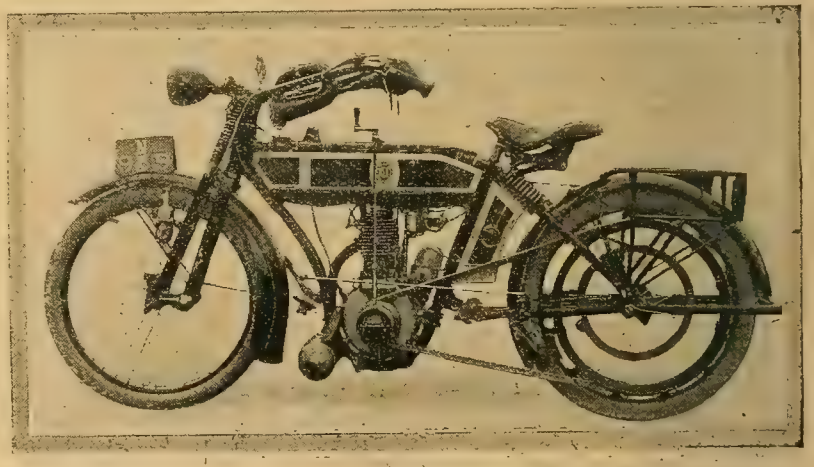
REGINALD C. STONE.

Tyres and Accessories in the T.T.

Sir,—With reference to the letter appearing in the issue of June 19th from the Palatine Tyre Co., we can assure your correspondents that it is quite a recognised thing for competitors in these important events to receive remuneration for using the various accessories necessary for the event, or at all events receiving a considerable sum in case the competitor was successful. We received a large number of applications from riders in the T.T., saying they would like to use our carburetters provided we would agree to their terms. In every case, we wrote to these gentlemen asking what terms other makers had offered them, and on receipt of this information we carefully considered the question, but as the T.T. event was purely a speed contest, in which any carburetter which had a big enough choke tube, and a big enough jet, would do all that was required, the opportunity seemed of little value to us, and we thought the money would be better invested in advertising our carburetters in this journal, although if we had been making accessories such as tyres, the quality of which a race of this description would undoubtedly show up, we should not grumble in paying riders who were prepared to take such serious risks.

We sincerely hope that next year's T.T. race will not be confined to speed test only, but that a very small proportion of the race, especially in the most dangerous portions, will be devoted to half a mile dead slow running without misfiring, with, say, half a dozen walking starts within this half mile. This would then show the buying public that a machine was not only exceedingly fast and reliable, but that it was capable of running really slowly without misfiring, and also capable of being started by pushing it along at a walking pace. If conditions such as these were imposed, the race would, in our opinion, be much more valuable from a buyer's point of view, and under such circumstances we should not think it a hardship to remunerate the users of our carburetters.

CHAS. BINKS.



The 1912 pattern 3½ h.p. N.S.U. machine, which has been equipped with many new and up-to-date fitments. (See accompanying letter).

Sir,—As a motor cyclist of ten years' experience I am pleased to see the letter from the Palatine Tyre Co. It is surely time that steps were taken by the Cycle and Motor Cycle Manufacturers' and Traders' Union, Ltd., and the motoring press to put a stop to practices which not only mislead motorists, but are in themselves pernicious.

A certain tyre firm offers £150 to the winner and 6d. per mile to all starters. This is countered by an opposition firm offering double for all starters on their tyres. A magneto manufacturer gives £25 to the winner if his fittings are used. Carburetter manufacturers vie with each other in offers of £50 for a win, £25 for second, £15 for third place, and from £5 to £10 for all starters. Oil merchants, petrol vendors, plug makers, and tribes of others follow with bewildering offers until it becomes a handsomely paying job to start, and a win secures a fortune.

Can anything be more vicious? What chance has the maker of better fittings if he be unable or unwilling to join the riot and "go the pace"? What chance have motor cycle manufacturers of seeing their tested fittings proved in competitive trial when their riders "improve" their mounts according to the best offer they receive.

Bad as the above practices are, they are placed in the shade by riders—professional and otherwise—who brazenly ask fittings makers not only for goods "for trial," but for "retainers" for using their specialities during the season.

Now, sir, these practices can be stopped, and surely it is high time that steps were taken. May I advance the following suggestions:

1. That publishers should omit in their accounts of winners' machines "So and So's carburetters, Somebody's tyres, Blank's magneto, and Dash's plugs, etc.

2. That the Cycle and Motor Cycle Manufacturers' and Traders' Union, Ltd., should issue a Black List among their members, who would agree not to use the productions of offending firms if they could substitute others.

3. That such a Black List should be supplied to publishers on the understanding that they should not accept from such firms advertisements giving accounts of their wins and records.

By these means I believe the trade could be purified, and merit rather than the longest purse take the premier position.

H.G.L.

Sir,—The letter of the Palatine Tyre Co. in your issue of June 19th begins to shed some light on the enquiry made by "Interested" on June 12th. It has been agitating the minds of many more readers besides "Interested," but with the above exception no satisfactory response has been made. I have heard, on good authority, that one of the winners received a matter of £400 from a certain tyre firm. If that is a fact, it is a direct incentive to a competitor to take the risk and chance of breaking his neck for the sake of the money offered. Some men would use any tyre, no matter how poor in quality, if the inducements were large enough.

What readers are asking themselves is: Who pays for this? The answer is apparent. No firm can afford to do this sort of thing and at the same time put full value in the goods they sell to the public. Either they are philanthropists or purchasers of their goods pay for quality and material they do not get. There are dozens of various makes of British tyres of far better value to the ordinary user than the foreign ones whose reputation is obtained by these ficticious means.

FURTHER INTERESTED.

The Motor Cycle for Business Purposes.

Sir,—Replying to "Traveller's" remarks in *The Motor Cycle* of June 26th, this gentleman emphasises the fact that he does know, and, at the same time, wishes me to enlighten him. The best advice my patience will allow me to give him is to advise him to wait till he has had a season of 20,000 miles, then count every cost (as he should do), and I am willing to wager he will find my figures correct. My experience is that you have to double every maker's estimate of running cost to be near enough, and, if he will do this, he will again find confirmation of the fact that it cannot be done on ½d. a mile. My firm run two 3½ h.p. sidecars, 1d. a mile, one twin 5 h.p. sidecar, 1½d., besides my cycle car, so you see I am not guessing, but giving auditors' facts.

Replying to "B.H.T.A.," he cannot run the combination he mentions for 15,000 miles for £78. I take it he is to buy the machine—then he will have to include £5 interest on outlay—increase his depreciation to 33⅓—reckoning 5,000 miles per average tyre—he will have to double cost of extra bought tyres—repairs, etc., will be double the amount he mentions—he does not mention garage (lucky chap). There are exceptions to every rule, and the facts I have mentioned are only as I have met them. Nobody will deny time saved on journeys when you are not on main line, but I still adhere to my statement *re long* business journeys, train is more comfortable and cheaper.

ANOTHER TRAVELLER X1140.

An Unstretchable Belt.

Sir,—I should like to point out that the belt illustrated in your issue of June 26th is not new. I believe that several belt makers have tried it, and I know one who discarded it some six years ago. I have a piece of this somewhere. I also have a belt with the middle layer of leather interwoven with fine wire, but, in my opinion, a belt that will not stretch is not worth having.

J.T.B.

The Transmission Question.

Sir,—Mr. P. J. Foster presents such a distorted view of the facts of the above question that I feel compelled to cross pens with him.

He refers to the time taken during the A.C.U. trial of an Ariel motor cycle and sidecar to adjust belts, but omits to state that the belts used were experimental ones, and that the machine was found to be considerably out of alignment at the termination of the trial. Under such conditions chains would not have run on the sprockets for five miles.

In cases where the best of both types of transmission are used there is nothing to choose between them as far as reliability is concerned. I have recently had two instances under my notice of long distances being covered by belt-driven passenger machines without adjustment. One was George Brough's 6 h.p. sidecar machine, which ran from Nottingham to London, through the London-Edinburgh-London trial, and back to Nottingham, without adjustment to the belt—a distance of about 1,040 miles. The other instance is of a 3½ Rover and coachbuilt sidecar, which ran over 1,700 miles with one adjustment; this being necessary only because the belt was sagging enough to touch the belt guard.

A point where the belt scores in a way that the chain never can is in cases where the machine is used for both passenger and solo riding. The gear can be lowered or raised according to conditions in two or three minutes by using the adjustable pulley and a spare link; but variation on chain-driven machines takes a considerable time, is a dirty job, and can only be made within certain limitations.

I can recall discussions on this question over the last ten years, and it is still where it was ten years ago; that the best of each type is as good as anyone wants, and that each man claims to have that which is best.

HAROLD KARSLAKE.

Sir,—Your correspondent, Mr. P. J. Foster states with regard to the A.C.U. certificate of performance of the Ariel motor cycle and sidecar, "This alone should prove to the prospective buyer which method of transmission will give him the most satisfaction." In my opinion, the test proves nothing at all, since the average life of belts used was under 700 miles—a figure which no belt user would accept as a normal mileage.

I should be pleased to accept Mr. Foster's belt *v.* chain challenge, though I fail to see how this trial can be carried out, unless we are to ride in each other's company for the whole distance. Perhaps Mr. Foster will also state what conditions he wishes to impose. I would suggest a loss of a mark per minute for any time spent in adjustments.

I should use a John Bull belt, as I am now nearing 1,000 miles with one of these belts without any adjustment having been made. The belt tension appears exactly the same as when the new belt was fitted, and since there has been no appreciable stretch in 800 miles I am hoping to get 2,000 without any other shortening than changing a link in the fastener. About 350 miles of the distance has been with sidecar. The machine is a three-speed Triumph, and I have no interest in the John Bull Co.

F. L. BASSETT.

Hill-climb in the West Country

J. Cocker (3½ h.p. Singer) at the first bend, which is immediately above the starting banner.

CLAPTON-IN-GORDANO was once again the venue of the Bristol Bicycle and Motor Club for their annual open hill-climb. The hill has an average gradient of 1 in 7.22 for approximately two-thirds of a mile, and is sufficiently straight to make a fine hill for test purposes. The arrangements were excellent, and the competitors followed each other with commendable promptitude. The course was well marshalled, and between each class an official rode up the hill with a placard stating in red letters that the class was over. After competitors had returned to the hill foot he rode down exhibiting a notice in white letters stating that the course was again closed for the next class.

Absentees.

F. W. Barnes was one of the few absentees, and Holloway was, unfortunately, unable to ride owing to an accident in the morning. He was driving his big sidecar machine up the slope which precedes the hill with A. J. Orde in the sidecar and P. Grout on the carrier, when, owing to another machine being in the way, he was unable to take the sharp right-handed corner and crashed into the wall. He cut his knee badly, and damaged both wrists and his elbow, but, fortunately, no bones were broken. The sidecar body left the chassis, and Orde damaged both knees and his chest, but he was able to ride. Grout escaped unhurt.

CLASS I., for single-cylinder machines up to 350 c.c., drew so few entries that the expert and general classes were run off together.

H. R. Davies (2¾ Sunbeam) made an exceptionally fine climb, followed by J. Cocker (2¾ Singer), whose performance was almost as good. Heaton's A.J.S. was obviously off colour, but Williams, on a similar mount, came up fast. E. A. Davies, on a 2½ single-geared Premier, failed to reach the top, saying that he was obstructed by the crowd at the bottom corner. Results:

Rider and machine.	Time. secs.
H. R. Davies (2¾ Sunbeam)	43⅘
J. Cocker (2¾ Singer) ...	46⅕
C. Williams (2¾ A.J.S.)	47

Rider and machine.	Formula.
H. R. Davies (2¾ Sunbeam)	2,188
J. Cocker (2¾ Singer)	2,345
C. Williams (2¾ A.J.S.)	2,409

For some reason which was not apparent Williams cut out on the curves, thus probably losing second place.

CLASS II.—Twin cylinders up to 350 c.c.

This class was entirely composed of Douglas and Humber machines. Kickham's Douglas appeared to be the fastest, but he had trouble with the ruts at the foot of the hill. Moore's Humber was also obviously fast. Nearly all the machines made good climbs, but F. C. Wasley, P. Phillips, and W. D. Giles, all on Douglases, and M. Anderson (Humber) were probably the most meritorious. Results:

	Time. secs.
E. Kickham (2¾ Douglas)	42
W. Moore (2¾ Humber)	43⅘
P. Phillips (2¾ Douglas)	49

	Formula.
E. Kickham (2¾ Douglas)	2,181
W. Moore (2¾ Humber)	2,263
P. Phillips (2¾ Douglas	2,617

H. Blocksidge, the late secretary, lost much valuable time by changing up into top on the lower stretch of the hill.

CLASS III.—Single-cylinder engines above 350 c.c. and up to 500 c.c.

Cocker (3½ Singer) was the fastest in the expert class, whilst Dixon, on a similar machine, was also fast. His 14

THE FINISHING BANNER.

P. H. A. Mathews (Ruige), who with J. Cocker (Singer) shared eleven first prizes.

Hill-climb in the West Country.—

stone. however, told somewhat on his time. S. Crawley (Triumph) made a particularly fine climb, but C. T. Newsome, though going well, was not at the top of his form. Results :

	Time. secs.
J. Cocker (3½ Singer) ...	37⅗
S. Crawley (3½ Triumph)	39⅕
A. J. Dixon (3½ Singer)	42⅕

	Formula.
J. Cocker (3½ Singer)	2,211
A. J. Dixon (3½ Singer)	2,249
S. Crawley (3½ Triumph)	2,366

Cocker's time is a record for the hill.

In the general section, Mathews, Orde, Kellar, and Haskins appeared to make the best performance, and C. H. Fry (Rudge) was fast, but, with H. G. Liefelt on a similar machine, he was disqualified by the judges for riding too noisy a mount. Results :

P. H. A. Mathews (3½ Rudge)	38⅘
M. A. J. Orde (3½ Rover)	44⅗
J. B. Kellar (3½ B.S.A.)	45

P. H. A. Mathews (3½ Rudge)	2,092
E. P. Haskins (3½ Singer)	2,710
J. B. Kellar (3½ B.S.A.)	2,971

The increased speed in this class showed the surface of the hill to be bumpy in parts, and also that the top curve is worse than it appears.

A Good Recovery.

CLASS IV.—Singles up to 500 c.c.

Among the experts, H. R. Davies, Cocker, Newsome, Dixon, and Crawley all came up in fine style, Davies's little Sunbeam making a particularly meritorious ascent. Crawley unfortunately hit the bank at the top curve, but made a splendid recovery, and got off lightly with only a bruised leg and a bent footrest. Results :

J. Cocker (3½ Singer)	38⅕
C. T. Newsome (3½ Rover)	41⅗
A. J. Dixon (3½ Singer)	41[illegible]

H. R. Davies (2¾ Sunbeam)	2,011
A. J. Dixon (3½ Singer)	2,186
J. Cocker (3½ Singer)	2,282

Mathews was easily the fastest in the general class, but Tubbs (3½ Humber) did very well, and Williams, Rowlandson (Rudge), Orde, Clement, and Haskins were all fast. Results :

P. H. A. Mathews (3½ Rudge)	39⅗
S. Tubbs (3½ Humber)	42⅕
F. C. Clement (3½ Triumph)	43⅘

P. H. A. Mathews (3½ Rudge)	2,179
C. Williams (2¾ A.J.S.)	2,389
S. Tubbs (3½ Humber)	2,644

W. H. Sheldon (3½ Regal Precision) negotiating the first bend

H. R. Davies (2¾ h.p. Sunbeam) at the first bend. Several competitors wobbled badly in the rut at this point. Davies was one of the best cornerists of the day and again won on formula.

CLASS V.—Racing machines up to 1,000 c.c., rider to weigh not less than 11 stone.

Experts only were allowed to ride in this event, and the times were very good and close. Results :

	secs.
J. Cocker (3½ Singer)	38⅘
C. T. Newsome (3½ Rover)	39
S. Crawley (3½ Triumph)	39⅖

As will be seen from the above times, ⅗s. covered the first three men. Cocker's machine carried three bricks to make weight, neatly packed in tool bags.

CLASS VI.—Three-wheeled passenger machines up to 1,000 c.c.

There were only three competitors in the expert class, but all made good times. Wade on a Zenith-Green showed up very well, while Griffith (7 Zenith) made easily the fastest climb. Results :

G. Griffith (7 Zenith sc.)	48⅘
C. T. Newsome (3½ Rover sc.)	57⅕
A. B. Wade (3½ Zenith-Green sc.)	61⅕

A. B. Wade (3½ Zenith-Green sc.) ...	2,214
C. T. Newsome (3½ Rover sc.)	2,915
G. Griffith (7 Zenith sc.)	3,601

As will be seen from the results of Classes V. and VI., Newsome (Rover) had made up for his moderate performance earlier in the day.

Quite one of the finest performances of the day was put up in the general section by W. W. Douglas, who brought up his little 2¾ mount with sidecar and 10 stone passenger at a good pace, and easily won on formula. Chapman (Zenith) made a good climb, as also did Rowlandson, whose belt broke as he crossed the finishing line. Result :

E. Chapman (6 Zenith sc.)	58
S. A. Rowlandson (3½ Rudge sc.)	70⅕
E. A. Davies (3½ Premier sc.)	71⅖

W. W. Douglas (2¾ Douglas sc.) ...	3,549
E. Chapman (6 Zenith sc.)	4,022
S. A. Rowlandson (3½ Rudge sc.)	4,067

Class VII. was for racing single-cylinders up to 500 c.c., and the expert class brought forth much the same results as Class V., except that Newsome and Crawley changed places. Result :

	secs.
J. Cocker (3½ Singer)	38⅕
S. Crawley (3½ Triumph)	39
C. T. Newsome (3½ Rover)	39⅗

A Hill-climb in the West Country.—

Among the generals, Mathews and Rowlandson again shone, while Clement, Haskins, and Moxley (B.S.A.), whose stand was dragging, all came up well. Results:

	secs.
P. H. A. Mathews (3½ Rudge)	41⅗
S. A. Rowlandson (3½ Rudge)	43
F. C. Clement (3½ Triumph)	44⅕

CLASS VIII.—For singles up to 500 c.c. and twins up to 650 c.c. Experts barred.

This class produced the largest entry of the day, and it was hard to pick a winner between Mathews, Rowlandson, Williams, Kickham, Moore, and Haskins. Results:

P. H. A. Mathews (3½ Rudge)	39⅖	C. Williams (2¾ A.J.S.)	2,150
S. A. Rowlandson (3½ Rudge)	40⅗	P. H. A. Mathews (3½ Rudge)	2,157
E. Kickham (2¾ Douglas)	42⅖	E. P. Haskins (2¾ Sunbeam)	2,215

Where the "Generals" beat the "Experts."

CLASS IX.—For singles up to 500 c.c. and twins to 650 c.c.

This event took the form of a stopping and starting test on a steep part of the hill. Unfortunately it was not the success it might have been, owing probably to the fact that no one knew where the test was to take place till they were actually at the tape. Only three started in the expert class, and of these Heaton and Edmond both got away fairly well, and Wade broke a belt just after getting going.

W. Heaton (2¾ A.J.S.)	64⅗	W. Heaton (2¾ A.J.S.)	4,654
F. G. Edmond (2¾ Humber)	74⅘	F. G. Edmond (2¾ Humber)	6,133

There was a better entry in the general class, and H. Hutchinson (3½ Rudge) got away quite smartly, and Haskins, Moore, E. A. Davies (3½ Premier), and Giles all did well. Several having no free engines stopped and pushed off again; no easy work on a 1 in 7 gradient. Results:

H. Hutchinson (3½ Rudge)	58	E. P. Haskins (2¾ Sunbeam)	3,801
W. Moore (2¾ Humber)	59⅗	W. Moore (2¾ Humber)	4,190
W. Giles (2¾ Douglas) ...	61⅖	H. Hutchinson (3½ Rudge)	4,271

Organisation.

The club is to be congratulated on the organisation of the event. The hill was perhaps a bit too twisty for the faster machines, but it was quite as safe as most climbs. Among the finest performers Cocker and Dixon (Singer) were particularly noticeable, though Mathews (Rudge) rode very well and obtained a number of firsts. H. R. Davies (Sunbeam) was another very successful competitor, and S. Crawley (Triumph) and C. T. Newsome (Rover) both shone at times. Kickham (Douglas) did extremely well in Class II., and in the sidecar class W. W. Douglas (2¾ Douglas sc.) put up an extraordinary performance. The climb was well attended by the public, and machines of all descriptions were represented at the start.

The dust on the roads near Bristol was terrible, and returning from the climb everyone appeared to have a white cloak.

W. Rowan (6 h.p. Swift) on Fintry Hill.

SCOTTISH OPEN TWELVE HOURS' TRIAL.

Eventful Day in the West Highlands.

THE annual open trial promoted by the Glasgow Motor Cycle Club was full of incidents and accidents, and will long be remembered by the participants. A slight variation in the route was made, because the road from Gairlochhead to Arrochar is at present closed to excessive traffic, and in some places is rather dangerous, and the course was as follows: Canniesburn Toll, Bearsden, Bowling, Alexandria, Luss, Tarbet, Arrochar (first control), Rest and be Thankful, Inveraray, Dalmally (second control), Tyndrum, Killin (lunch control), Kenmore, Aberfeldy, Amulree, Crieff (fourth control), Dunblane, Doune, Thornhill, Kippen Station (fifth control), Fintry, Lennoxtown, Blanefield, and finish at Bearsden. The following were the observed hills: Little Rest, Rest and be Thankful and Fintry. Failure to make a clean ascent meant the loss of a medal.

The Start.

An excellent entry of fifty riders, including motor cycles, sidecars, and a Swift cycle car, had been received, and of this number forty-two started, the others no doubt considering the weather conditions none too promising, and deciding not to attempt the journey. E. Hunter (2½ A.J.S.) had a sidecar attached to his lightweight, and arrived at Arrochar to time, but was not heard of afterwards.

Competitors were despatched in couples at minute intervals. A great many of the men appeared to have difficulty in getting away at the start, exceptions being those mounted on Douglas machines, which were easily paddled off by their riders. Shortly after the start, the weather, which had appeared threatening, broke down completely; there was, however, but little belt trouble under conditions far from favourable.

Unfavourable Conditions.

The run up Lochlomond side was completely spoiled by the rain and the atrocious road surface between Inverbeg and Tarbet. Widening operations are being carried out at this point, and in consequence the surface is one mass of liquid mud, in places quite six inches deep. The majority arrived at Arrochar to time, and then commenced the most severe part of the route—the ascent of the Rest. This was rendered more difficult than usual owing to the particularly strong wind which blew right down the hill through Glen Croe. Although the road is now cut through the recent landslide, the surface here is still not what it was.

The Little Rest gave the competitors a foretaste of what they might expect at the hill itself. While a fair number of the solo riders managed to reach the top unassisted, a

D. Bell (6 h.p. A.J.S. sidecar) and A. J. C. Lindsay (Douglas) stop for petrol at the Tarbet Hotel.

Scene at the start. Competitors setting their watches to official time.

good many, however, failed in addition to all the passenger vehicles, except three 5-6 A.J.S. machines and sidecars and the Swift cycle car, which had throughout the whole trial been running excellently. It is significant that, although it is said that a 3½ h.p. machine will take a sidecar anywhere, all passenger machines of this power failed on both the Rests. The best performance of a 3½ and sidecar on the big Rest was that of J. L. Smith (3½ Triumph sc.), who would have reached the summit had he not taken the corner too fast and finished in the ditch. This fault was common, and the older hands, who know the hill well, gave the best displays. One or two of the riders had rather nasty falls at the last bend.

A Chapter of Accidents.

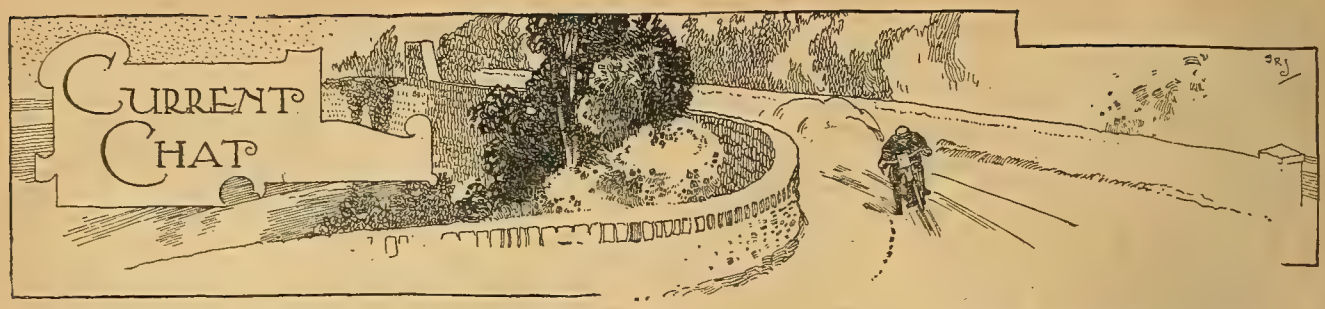
The run down to Cairndow was without incident, R. M. McCulloch (5-6 A.J.S. sc.) being the only competitor noticed in trouble, which appeared to be due to a burnt clutch. This must have been serious enough, as he was not seen afterwards. The road from Inveraray to Dalmally is nothing but a series of corkscrew bends and sharp gradients, and many of the riders have cause to remember this stretch. T. A. McCreadie (2¾ Sunbeam) was found by two fellow competitors lying across the road stunned, his machine alongside. After he came round he was unable to account for the accident, but pluckily resumed; he retired, however, at Killin. J. E. Chisholm (3½ Ariel sc.) also experienced trouble. Rounding a corner rather fast in an endeavour to make up lost time, the sidecar tyre came off, the wheel buckling badly. The rider was, however, able to pull up the combination, so that there were no personal injuries. The remains of the sidecar being despatched home by train, Chisholm resumed the trial with his passenger on the back carrier, arriving in Killin about an hour and a half late. D. S. Paterson (3½ Rudge Multi) had rather a severe fall on this same road, and after resuming met with further trouble in the shape of a broken belt, which delayed him so much that he retired.

From Killin to Crieff, the next check, the only noteworthy incident was rather of a distressing nature, due to one competitor running into another from behind and sustaining a very bad injury to his face.

Very few appeared to have difficulty in the negotiation of the Fintry Hill, and all those who had survived to this point arrived at the finish at Bearsden as follows: G. W. Orr (3½ Ariel), A. R. Fraser (3½ Rudge Multi), D. S. Baddeley (3½ P. and M.), W. Hood (3½ Rudge Multi), W. Deans (6 Hazlewood), A. J. C. Lindsay (2¾ Douglas), W. Hutchison (2¾ Douglas), G. Taylor (6 Brough), R. D. Fleming (3½ Triumph), R. W. Reid (3½ Bradbury), J. W. Binnie (5 Hazlewood), F. Galbraith (7 Indian), W. Alexander (7 Indian sc.), G. Thompson (6 A.J.S. sc.), H. M. Stich (3¾ Scott sc.), D. Bell (6 A.J.S. sc.), B. Paterson (6 Clyno sc.), W. Rowan (6 Swift cycle car), G. Wilson (5 Rex sc.), J. L. Smith (3½ Triumph sc.), D. N. Johnston (8 Matchless sc.), and J. Cameron (3½ Ariel).

FIRST CYCLE CAR HILL-CLIMB AT SOUTH HARTING.

A. Nash (G.N. runabout), winner of the best-supported class.



TIME TO LIGHT LAMPS.

Racing on the Sands.

At West Sands, St. Andrews, on Thursday, the 24th inst., point-to-point motor cycle and cycle car races will be held, eight classes being included, the distances varying from one to eight miles.

Cockney Wit.

A cycle car chassis was recently being driven to the body builders through the streets of London when a passing taxi-cab driver accosted the man at the wheel, "What have you got there, cocky, an eight-day clock?"

Cycle Cars at Clipstone.

There was a class for cycle cars at the Notts A.C. speed trials at Clipstone, near Mansfield, on Saturday last, but only two entries were received and one of these was a non-starter. The car which ran, the little 8-9 h.p. four-cylinder Calthorpe, therefore had a walk over, but it also ran in the car classes, and out of three runs down the course (slightly downhill), its best time for the flying kilometre equalled a speed of 55.37 miles an hour.

John-o'-Groat's to Land's End.

In defiance of the Auto Cycle Union ban of road records in excess of the legal limit, Ivan B. Hart Davies, of Rugby (often confused with our contributor Rev. B. H. Davies, of Northampton), last week journeyed from John-o'-Groat's to Land's End on a 10 h.p. Singer light car in 34h. 39m., equalling an average speed of 25.57 m.p.h. This is a wonderful achievement, and no less striking as a demonstration of reliability of the car as of the endurance of the driver. We gathered from Hart Davies when he called at our offices with the Singer last week that he was lucky to finish, for he experienced some trouble with his back axle in the neighbourhood of the Land's End. This is almost a repetition of his Triumph motor bicycle record, when, only a few miles to go, engine troubles almost put a final stop to the ride. It will be remembered that after that memorable run, the A.C.U. suspended Hart Davies for some months, and we refrain from giving further details of the latest performance, as we are entirely at one with the Auto Cycle Union in its endeavour to suppress road records when the legal limit is so constantly exceeded, and that by a large margin.

An Impossible (?) Hill.

In the 1913 Michelin Guide, British Isles, p. 387, Llangollen, appears Clyn 5 "Impossible hill for motors." We wonder if this ascent is known and if it has been climbed, as motor cyclists are usually ready to try their prowess on any hill termed "impossible."

Horse-power—Nominal and Actual.

The desirability of a standard horse-power rating for motor cycles, which has been advocated before in our columns, is very plainly shown by the following story:

"On the 1st ult., a road race for motor cycles over a distance of one verst was held in the vicinity of St. Petersburg. F. Holden, an English rider, arrived on the course with a 3½ h.p. Zenith, 90×77½ (493 c.c.) The machine was equipped with full touring outfit, and weighed 241 English pounds. On asking to be allowed to enter the 3½ h.p. class, permission was brusquely refused, on the plea that the machine was one of 4 h.p., but he was ultimately allowed to participate, and made fastest time (44⅜s.), the second being Beyling, a Russian rider, on a T.T. Triumph (499 c.c.), weighing 169 English pounds, entered as a full touring model (time, 45⅜s.) The Russian rider appealed against the judges' decision, on the plea that the winner's machine was one of 4 h.p., and Holden was disqualified. He has, however, appealed to the organiser of the race, but, as things move slowly in Russia, the case is still *sub judice*."

SPECIAL FEATURES:

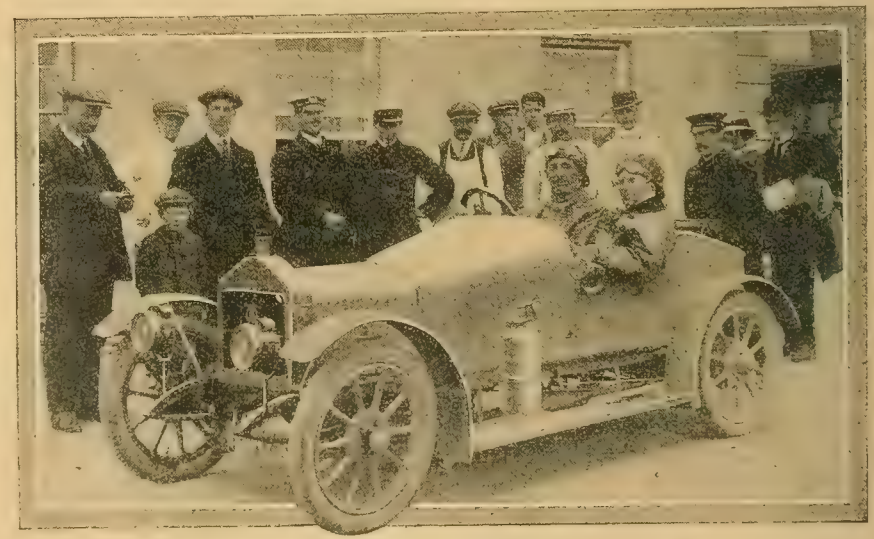
INNOVATIONS
IN THE SIX DAYS' TRIALS.
SLOWING DOWN THE SENIOR T.T.

The Bath Road.

A considerable portion of the Bath Road between Hayes and Colnbrook, Middlesex, is being resurfaced by the Limmer Asphalte Paving Co., Ltd.

Six Hours' Race at Brooklands.

The open six hours' race of the British Motor Cycle Racing Club at Brooklands on Wednesday, July 16th, is creating an exceptional amount of interest. Racing men of note are preparing for the event, and some keen racing—in fact, a Tourist Trophy re-union—is the promise. A long distance race such as this is a very severe trial for the rider. There is a good deal of speculation as to the distances which will be covered in the six hours, and many predict that records will go. Sam Wright will make another attempt to be the first to cram 60 miles into the hour on his twin Humber. G. E. Stanley may ride a 2¾ h.p. Singer with the same idea, and Howard Newman might also accomplish the feat on his little Ivy-Green. J. R. Haswell will be seen in the 500 c.c. event after a long rest. His Triumph is said to be very fast. Altogether the next B.M.C.R.C. meeting promises to be an event of particular interest.



I. B. Hart Davies on the Singer cycle car at the conclusion of his unofficial run from John-o'-Groat's to Land's End in 34 hours 39 minutes.

H. Riddell, who, mounted on a 3½ h.p. Zenith-Green sidecar, broke records up to four hours at Brooklands, as reported in our last issue.

Sparking Plug Adapters.

Since we published the tip of a sparking plug adapter to prevent oiling up on V type twins, we have received many enquiries as to where the adapters may be obtained. Almost any large garage or accessory house can supply such a fitment. Incidentally we have covered another 500 miles on our Humberette and have not had occasion to remove the plugs.

English-Dutch Trials.

Additional subscriptions to the fund to entertain the Dutch motor cyclists when they visit England next month are given below :

	£	s.	d.
Hendee Manufacturing Co. ...	2	2	0
Rudge Whitworth	2	2	0
Edward Lycett	1	1	0
H. Collier and Sons	1	1	0
Temple Press	1	1	0
C. R. Collier		10	6
W. G. McMinnies		10	6
E. M. P Boileau		10	6
Bennett Mitchell...		10	6

A regiment of Boy Scouts to assist in the trial on August Bank Holiday has been arranged by Mr. R. A. Bishop, of Oxford. The assistance of neighbouring club members as marshals is also requested.

Penalty for Using Noisy Machines.

The Leamington police are still taking action as regards noisy machines. Already there have been several summonses issued against the riders of noisy motor cycles, and while the Bench dismissed the cases on payment of costs, it was announced that, in dealing thus leniently with these cases, a precedent was not being established, and future offenders would not be treated with such leniency. As the police in Leamington have always been favourably disposed towards motorists, it is hoped that motor cyclists will be careful to run as quietly and silently as possible through the town.

In several parts of the country the police are very active in taking steps against the riders of noisy machines. No fewer than a dozen riders were convicted and fined 10s. and costs, amounting to about 18s. in all, in Birmingham the other day. The police are working in the vicinity of Northfield and Rubery on the Bristol Road, near Birmingham. It is not generally known that, although a cut-out between the exhaust port and silencer is illegal, a rider may be summoned under the new regulation even if the gases first pass through an expansion chamber before issuing into the open air if a police officer considers the machine is noisy. It is a matter of ear test alone.

A Curious Case.

The other day an Uxbridge resident who had bought a cheap motor bicycle redesigned the frame and fitted an engine in a workshop adjoing an hotel yard. When the alterations were complete he tried the machine in the yard at a time when a local taxation licence officer was passing. The latter asked the owner if he had paid the £1 tax, which the latter said, of course, he had not, and there were not even numbers on the motor cycle. Shortly afterwards the owner received summonses for not taking out the local taxation licence and for riding an unlicensed machine. Fortunately, he was defended by the Auto Cycle Union, and the magistrates dismissed the case.

FUTURE EVENTS.

July 5.—M.C.C. Meeting at Brooklands
„ 5.—Herts County A.C. Open Hill-climb at Kop.
„ 5.—North-Eastern A.A. Open Hill-climb.
„ 5.—Mersey M.C. Open Speed Trials at Colwyn Bay.
„ 13.—GRAND PRIX RACE. Motor Cycles, Sidecars, and Cycle Cars.
„ 14.—M.C.U.I. Irish End to End Open Trial.
„ 21-26.—Scottish Six Days' Trials.
„ 26.—B.M.C.R.C. Race Meeting.
Aug. 2-3.—International Cup Race in France.
„ 2-3.—Hertfordshire M.C.C. Open Half-Day Trial.
„ 2-4.—M.C.C. Devon Trial.
„ 4.—English-Dutch International Trial.
„ 9.—B.M.C.R.C. Race Meeting.
„ 18-23.—A.C.U. Six Days' Trials. (Carlisle as Centre).

Hill-climbing.

Some weeks ago a correspondent enquired whether any motor cyclist had climbed the steep hill out of Branscombe —between Sidmouth and Seaton. We now hear that W. H. Carson has made the ascent on an Excelsior with sidecar and a 13 stone passenger.

More Unofficial Records.

Last week we noticed threading his way through the traffic of Coventry a sidecarist whom we recognised from photographs as W. J. Clarke, of Horncastle. On the back of the sidecar was a notice regarding some record, and as we predicted, a day or two later, a claim to have beaten the six days' sidecar "record" reached us. The mileage given is exactly 1,800, and the hours taken to cover that distance 116½. Clarke rode a 4¼ h.p. Precision engined Monarch with sidecar pattern Roc two-speed gear.

Selecting the Six Days' Trials Course.

The chairman of the A.C.U. Competitions Committee, Rev. E. P. Greenhill, and the secretary, Mr. Lougborough, have just spent a busy week in Lakeland surveying the course for the Six Days' Trials in August. Carlisle, it will be remembered, is the centre, and the daily routes all radiate southwards. We are pleased to be able to state that practically all the acclivities dealt with in Mr. G. D. Abraham's articles in *The Motor Cycle*, "Hill Hunting in Lakeland," have been visited and selected for inclusion in the trial, with the exception of Wrynose Pass and Hard Knott, the surfaces of which are too poor. Messrs. Abraham and W. B. Little accompanied the A.C.U. representatives on their journeys, and with their knowledge of the roads were able to render great assistance.

INSPECTING THE COURSE FOR THE SIX DAYS TRIALS IN LAKELAND.. T. W. Loughborough (A.C.U. Secretary) on a Douglas and the Rev. E. P. Greenhill (Chairman of competitions Committee A.C.U.) on a Premier climbing the 1 in 6 gradient of Whinlatter Pass.

THE A.C.F. GRAND PRIX.

THE FIRST DAY OF PRACTICE. (By Our Special Correspondent).

AS has already been mentioned, the Circuit de Picardie over which the Motor Cycle Grand Prix will be run measures 17 km. 500 m. Motor bicycles cover the course twenty times, making a total distance of 350 km. = 217½ miles; sidecars and cycle cars cover the course fifteen times, making a total distance of 262 km. 500 m. It is comparatively flat, with many straight stretches, but the corners are bad. Tribunes, or grand stands, will be placed at the apex of the triangle formed by the corner round which the vehicles turn coming from the direction of Compiègne, and turn back on the road to Roye. The grand stands have been built parallel to the corner, and spectators will see the competitors arrive, turn, and depart, while the replenishment depots are placed in the inside of the corner. The numbered seats reserved for the public are placed on both sides of the course, while in the centre is a huge official enclosure and the press enclosure. In front of the grand stand and beyond the replenishment depots two weighing-in places are situated, communicating with one another by a subway under the road. Behind the grand stand is a large refreshment room, post office connected to the grand stand by telegraph and telephone wires, and with Paris, London, Lille, and Amiens, the offices of the A.C.F., garages in which the cars will be locked up after the engines, etc., have been verified, a hospital, tobacco kiosks, newspaper stalls, and a huge garage. The prices of admission to the official stand for the Grand Prix Race are as follows: Boxes to hold six 30 francs; reserved single seats 3 francs; admission to enclosure surrounding the stands 2 francs.

Admission to the weighing enclosure on the day previous to the races is 2 francs.

Machines may be stored in the official garage on July 11th and 13th for 2 fr., and on July 12th for 3 fr. The course has been improved, widened, and repaired, and the cross roads and corners have been treated with tarmac, trees which have been thought dangerous have been taken down, and the whole of the course will be treated with calcium chloride.

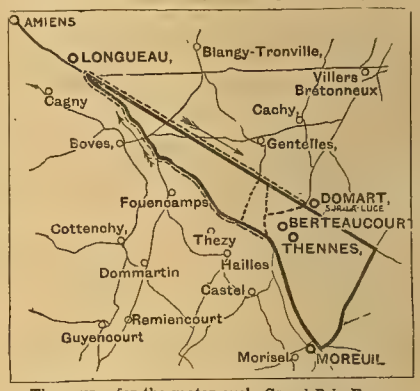
Excursions to Amiens.

The South-Eastern and Chatham Railway will run the following excursions to Amiens on July 10th, 11th, and 12th, available by the 10 a.m. and 2.5 p.m. service from Charing Cross *via* Boulogne, and the 9.20 p.m. *via* Calais, and returning from Amiens at 9.20 a.m., 4.55 p.m. *via* Boulogne, and 11 p.m. *via* Calais. These tickets will be available for fifteen days, at the following fares: First class 42s. 6d., second class 30s. 6d.

First Day of Practice.

Practising began at 3 o'clock on Monday morning. The course was well guarded by gendarmes, and there was a large crowd of spectators. Competitors, however, were few and far between. We noticed a Ronteix and two Bedelias. On Sunday afternoon three Violet-Bogeys went round the course and then returned to Paris. Not a single sidecar combination has yet turned up, but among the motor bicycle riders we noticed Fenton (Clément), Paul (Clément), Cisey (N.S.U.), Lombard (Clément), Woodhouse (B.S.A.), Bloch (René-Gillet), and Closs (N.S.U.). On Monday the Ronteix made five circuits, covering the distance 17 km. 500 m. in 16m. 30s. to 17m. It took the corners well, but did not give much impression of speed. The Bedelias accomplished barely one lap. Fenton is riding a new 350 c.c. Clément with overhead valves and a huge tank. He made two circuits, but each time returned slowly to the starting point. Woodhouse, who was riding a 400 c.c. Clément *during practice only*, covered a lap in 13m. 30s., which works out at 78 km. an hour. Paul and Lombard went round at touring speed. Bloch (Réne-Gillet, a standard machine on which he will race at Amiens) made a good lap in 16m.. Closs and Cisey (N.S.U.) each covered two laps, the former at an easy speed.

I have just covered the course on my Rudge-multi. I found it very dusty after the car practice, but M. Sautin, of the A.C.F., assures me that after being treated with calcium chloride, the dust will no longer exist. That part of the course which forms a portion of the Noyon Road is quite straight and very fast. The by-road which divides the Noyon from the Moreuil roads is very narrow, and, though it is wide enough for motor bicycles, sidecar combinations, and cycle cars, will have difficulty in passing. The right angle turn has been treated with tarmac by M. Sautin, and the motor cyclists may take it and those at Boves at high speed. I do not think the fastest machine will average more than 85 km. an hour. It is quite absurd that only three days of practice should be allowed, and these a fortnight before the race. What chance do the British competitors stand under these circumstances?



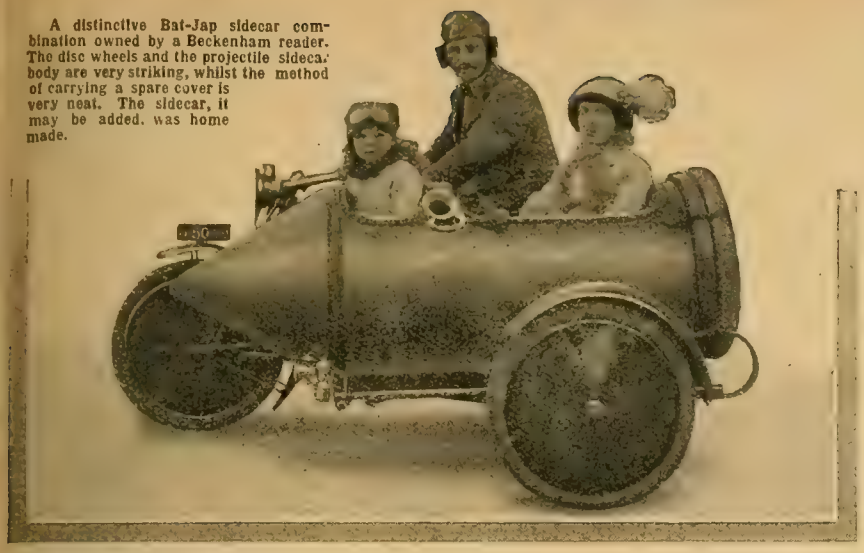
The course for the motor cycle Grand Prix Race on the 13th inst.

We learn that J. W. Woodhouse, who made the fastest time in the Grand Prix de Fontainebleau, may be riding a B.S.A. instead of Hodden, while the other B.S.A. riders will be Isodi and Fenn. The Clement team will consist of Fenton riding a 2¾ h.p. Clement, and Sproston a 500 c.c. of the same make.

The official distribution of the prizes gained by the English competitors in the Paris-Nice Trial will be made at Amiens on the evening of the Grand Prix, July 12th, on the occasion of a reception organised by *L'Aero*.

The Grand Prix Clyno sidecar was on the road last week and is reported to be very fast. We hear that Frank Smith is contemplating an attempt on some of the present track records.

A corner on the Grand Prix course as viewed from the grand stand, showing the subway.



A distinctive Bat-Jap sidecar combination owned by a Beckenham reader. The disc wheels and the projectile sidecar body are very striking, whilst the method of carrying a spare cover is very neat. The sidecar, it may be added, was home made.

FORMULA RESULTS OF CYCLE CAR HILL-CLIMB.

The formula results of the Cycle Car Club's open hill-climb (described on pages 885 and 886) are distinctly interesting. They show that J. F. Buckingham on a single-cylinder Chota put up by far the best performance on formula irrespective of class, though A. W. Lambert on a single-seated Morgan made fastest time of the day.

CLASS I.

	Fig. of merit.
A. W. Lambert (2-cyl. Morgan)...	.3206

CLASS III.

J. F. Buckingham (1 Chota) ...	2.096
A. E. Parnacott (4 Cycar) ...	.7836
K. Kreitmeyer (1 Zebra)	.2817

CLASS IV.

W. G. McMinnies (2 Grand Prix Morgan)	.4647
L. W. Spencer (2 Morgan) ...	.2584
A. W. Lambert (2 Morgan) ...	.2310

CLASS V.

L. Martin (4 Singer)	.3596
J. T. Wood (2 G.W.K.)	.3407
A. G. F. Nash (2 G.N.)	.3247
J. Chater-Lea (2 Chater-Lea) ...	.2436
A. P. Bradley (2 Duo)	.2255
E. H. Armstrong (2 Armstrong)...	.2014
N. Naylor (2 G.N.)...	.1917
C. M. Whitehead (2 G.N.) ...	.1792
G. N. Higgs (2 G.N.)	.1786

The Speeds Accomplished.

The measured distance of the climb is 1,500 yards, and it is interesting to note that the fastest speed was 32.2 m.p.h., accomplished by A. W. Lambert on his single-seater Morgan. The slowest cycle car averaged 9.4 m.p.h.

We give the speeds of the fastest in each class for reference purposes:

Class I.—A. W. Lambert (Morgan), 32.2 m.p.h.

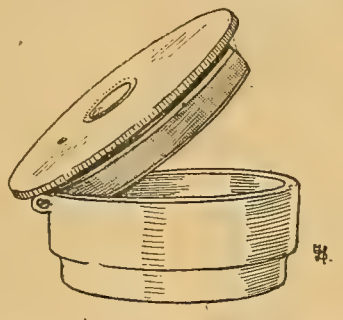
Class III.—J. F. Buckingham (Chota), 20.5 m.p.h.

Class IV.—W. G. McMinnies (Morgan), 29.8 m.p.h.

Class V.—A. G. F. Nash (G.N.), 27.6 m.p.h.

A NEW FILLER CAP.

A quick opening filler cap which has been used successfully in the T.T. Races may be considered to have undergone as stiff a test as is necessary for such a



fitment. This is the case with a simple little device which we have just received. The cap consists of a leather ring which is expanded or contracted by a half turn of the lid. The lid is hinged to the body, so cannot drop off, and the expanding leather washer fits the body so closely as to prevent any possibility of leakage, while half a turn of the lid is sufficient to open the filler

Best and Lloyd, Ltd., Cambray Works, Handsworth, Birmingham.

A FRENCH RACE.

In our report of the Circuit de Fontainebleau it was mentioned that W. A. Davis, on a Douglas sidecar combination, "had a class to himself." When it is realised that the $2\frac{3}{4}$ h.p. Douglas is not exactly a sidecar machine, and that this is

the first occasion in which so small a sidecar combination has ever taken part in a long distance race, it must be acknowledged that the performance was a remarkably good one. With a human freight of 23 stones it succeeded in averaging a speed of 26 m.p.h. throughout the whole race, which extended over 225 miles. Davis's wonderfully regular running throughout the long race evoked general comment among the spectators.

A group of Ceylon motor cyclists, who met at Kadugamiawa rock (under which the road passes) at the beginning of last month.

Thousands of spectators watched a procession of decorated cars and sidecars in Coventry on Alexandra Day. Our photograph shows the three sidecars and a cycle car entered. Left to right: C. H. Bovill's winning Matchless; "Miss" H. W. Hand's Williamson; G. Smith's Humberette, and Miss Hough's Scott sidecar.

THE SCOTTISH SIX DAYS' TRIALS.

The following additional entries have been received for the Scottish Six Days' Trials, bringing the total to eighty-three. The trials start on July 21st from Perth, and the course is a very sporting one over a distance of about 980 miles.

FIRST BALLOT.

G. A. Gregson (5-6 Bat)
R. M. Stalibrass (6½ N.S.U. sc.)
H. Thomson (3½ Kynoch)
J. A. Hoult (3½ Matchless)
J. R. Blackbourn (Morgan c.c.)
W. J. K. Gulland (3½ B.S.A.)
G. Taylor (3½ Rudge)
F. L. Bassett (2¾ Villiers)
E. H. Littledale (3½ Ariel)
James Cycle Co. (3½ James)
T. Laker (2¾ Elswick)
D. S. Alexander (Williamson sc.)
W. Hands (Williamson sc.)
J. G. Beveridge (3½ Rudge)
J. R. Alexander (7 Indian)
B. Alan Hill (7 Indian)
G. Armstrong (Gordon c.c.)
E. M. Oliver (5-6 Hazlewood)
J. Oliphant (3½ Premier)
A. W. Walden (3½ Premier)
G. C. Proctor (3½ Singer)
George Nott (——)
Miss M. Reid (3½ Brough)
F. Finlay (3½ James sc.)
D. Bell (6 A.J.S. sc.)
R. E. Guest (8 Matchless sc.)
C. R. Collier (8 Matchless sc.)
J. B. Robertson (——)
L. E. Cass (Trump-Jap)
A. D. Scott (Triumph)
T. Silver (Quadrant)
C. Q. Roberts (6 Zenith)
L. Sealey (B.S.A.)
H. M. Jameson (Enfield)
G. T. Gray (3½ Rudge)
Humber, Ltd. (3½ Humber)
Sam Wright (Humberette)
F. G. Edmond (2¾ Humber)
S. Tubb (3½ Humber)
G. Wray (Clyno sc.)
J. Steel (B.S.A.)

The second ballot has not yet been held.

Burton-on-Trent and District M.C.C.

A hill-climbing competition was held at Marchington Cliff on the 25th ult. The course was half a mile in length and included a 1 in 6 gradient at a difficult bend. The leading performances were as follows:

Lightweights.—E. Abrahams (2½ Singer), 70s.; G. Williamson (2¾ New Hudson), 70s.; A. Moorcroft (3 Singer), 70s.; tied for first prize.

3½ h.p. Touring Singles.—1, E. Mellor (Rudge) 37s. and S. Williams (Williams) 37s. tied; 3, E. Payne (Rudge), 38s.

1910 and Earlier Models.—1, A. Moorcroft (3 Singer), 60s.; 2, F. Read (3½ Triumph), 64s.; 3, H. Hardwick (3½ Triumph), 65s.

Sidecar Class.—1, A Moorcroft (4½ Singer sc.), 89s.; 2, J. Jordan (4¼ O.K.-Precision sc.), 112s.

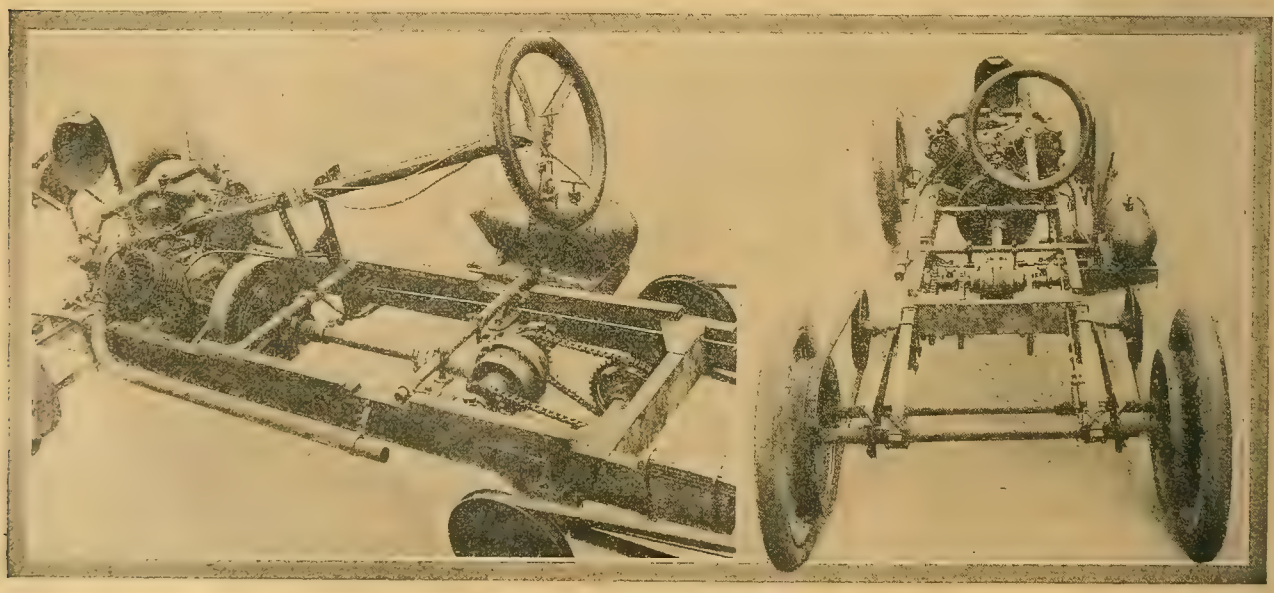
Tyldesley and District M.C.

A hill-climb took place on the 11th ult. The results were worked out on *The Motor Cycle* formula.

Solo Class.—1, A. Hobson (B.S.A.); 2, J. Bullough (8 Dot).

Sidecar Class.—J. Bullough (8 Dot).

A reliability trial was held on the 22nd ult. to Windermere and back, a distance of 150 miles, with two secret checks. Result: 1, N. Nay (6 Clyno sc.); 2, F. Newton (3½ B.S.A.); F. Gore (3¾ Scott); 4, E. Prestwick (6 Enfield sc.).



THE GRAND PRIX G.N. (See page 881).

(1) Showing arrangement of gears and engine position. (2) Rear view showing three-speed gear and general design.

THE GRAND PRIX DUO.

WE recently had an opportunity of inspecting the chassis of the Duo Grand Prix cycle cars at the company's works at Evelyn Street, Deptford. Two will be entered, one fitted with a 90° J.A.P. engine, 85×95 mm., with a chassis of novel construction, consisting as it does of a duplex ash frame with tie rods of spring steel bolted in between the upper and lower portions. The engine, as mentioned above, is the well-known 90° J.A.P. fired by a Bosch magneto (car type) neatly placed between the two cylinders. A Solex carburetter is fitted to each cylinder, and these are controlled by an accelerator pedal. The transmission is unaltered from the standard model, and standard size chains and belts are fitted. The hub sleeves are fitted with combined roller and thrust bearings, and also double Skefko bearings, while the back wheels are fitted with 3in. Palmer cord tyres.

Shock absorbers are fitted to all wheels. These are interesting as they consist of an arm pivoted on the spring shackle, the after end of which forms a disc, which is kept in tension by laminated springs with a Ferrodo disc attached to the frame. The back wheel brakes are a novelty, as they are of the duplex type, consisting of an internal expanding and an external contracting brake acting on the same 7½in. drum. Both brakes are Ferrodo lined

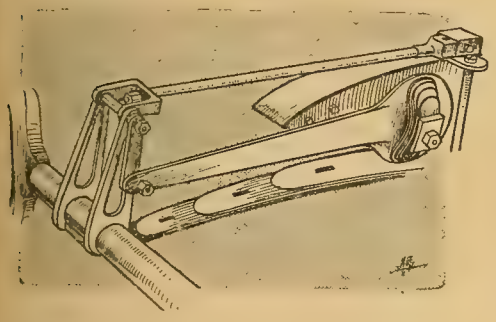
Chassis of the Grand Prix Duo which has a 90° engine set in line with frame.

Fuel Supply.

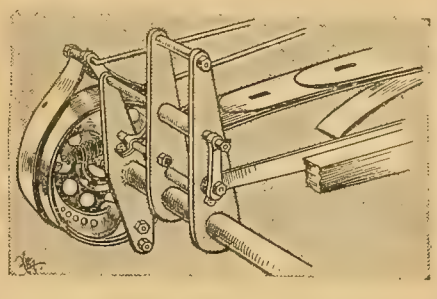
Two petrol tanks are carried, one of the usual cylindrical type above the engine, containing two gallons, and a six gallon tank underneath the floor boards. The petrol is transferred by pressure from the big tank to the small one, and thence by gravity to the carburetter. The machine is controlled by three pedals, the accelerator and two brake pedals. There are two side levers, as in the standard model, one for expanding the pulley and the other for taking up the slack of the belt, by moving the back wheel forward or backward. In the case of the Grand Prix model the spring does not slide, as in the case of the standard model, but remains stationary, and the adjustment is brought about by pivoting the wheel on to a special shackle, which system is clearly shown in the accompanying illustration. The lubricating tank is also carried underneath the floor board, and the oil is fed through two Best and Lloyd drip feed lubricators on the dashboard, which convey it to the front cylinder and to the crank case. The end of the petrol tank comes through the dashboard and is provided with a petrol gauge, which clearly shows the level of the fuel, while also fitted to the dashboard are a clock and speedometer.

A Water-cooled Model.

The second Duo is somewhat similar in most details to the model we have just described. It is, however, the first water-cooled machine of this make to be turned out, being fitted with the new overhead valve, water-cooled J.A.P. engine, 90 × 77.5, which is supplied with gas by means of a Stewart-Precision carburetter. The radiator is of a distinctly attractive appearance. The only other point in which this machine differs from the air-cooled model is that the pulleys are provided with springs to keep the gear normally in top, and to do away with all end thrust while the vehicle is running in top gear. At the time of our visit the water-cooled model was incomplete. The bodies fitted will be of steel built on to hoops of angle iron.



Shock absorber on the Grand Prix Duo.



Braking arrangement and new method of mounting the rear axle.

THE RACING G.N.

Messrs. G.N., Ltd., The Burroughs, Hendon, N.W., have entered two cycle cars for the Grand Prix, one of which will be driven by A. G. Fraser-Nash and the other by C. M. Whitehead. In most respects these two vehicles resemble the standard models of the latest type G.N., and we take this opportunity of referring to these briefly. The twin-cylinder air-cooled engine, fitted with overhead inlet valves, is fixed transversely in the frame, and drives through a Raybestos and steel disc clutch through a propeller-shaft to the primary counter-shaft, to which the power is conveyed through bevel gearing. Chains transmit the power to a secondary counter-shaft, on which is a simple form of dog clutch gear giving two speeds, and on this shaft pulleys are mounted, the final drive being conveyed to the rear wheels by means of rubber belts. The chassis is of ash, suitably strengthened and suspended on quarter elliptical springs fore and aft. The carburetter is a B. and B., and the magneto is an Eisemann. The steering is on the usual wire and drum principle, and the brakes, which are of the shoe type, act one on the inside and the other on the exterior of the belt rims. The Grand Prix cycle car driven by Nash has the engine three-point suspended, and three speeds are fitted, so that the vehicle can be accelerated at a more rapid rate. It must be understood that this is not a standard fitment, but has only been introduced specially for the race. An extra large pressure-fed petrol tank holding five gallons has been fitted to the rear of the vehicle, and also a large oil tank, and in the race Continental tyres will be used. Whitehead's cycle car is similar to the above, except that he is using a Solex carburetter and Dunlop tyres. Of the two vehicles above described, the gear ratios of the former are 3, 4½, and 6 to 1, and those of the latter, to which only two speeds are fitted, 3½ and 5 to 1. A good deal is expected of the racing G.N.'s.

C 2

AMONG THE ACCESSORIES.

Electrical Terminals.

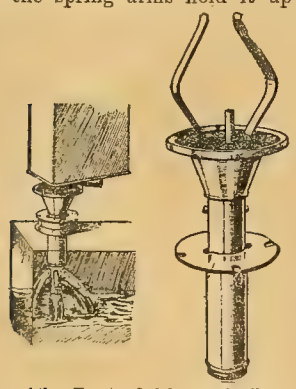
To ensure efficiency it is essential that all electrical connections should be well made, neat in appearance, and easily fitted. The Chater-Lea patent terminal which we illustrate is of tubular form, supporting the rubber cable, and it will be appreciated that there is no strain on the stranded copper inner wire. To

Chater-Lea terminal.

fit the terminal the insulation should be stripped off in the usual manner, and the wire inserted into the tubular slot formed for the purpose; the slot should then be flattened in a vice or with a hammer. The flattening spreads the copper strands through the holes with the result that the job is absolutely permanent. Ten sizes can be supplied for cables varying from 4 mm. to 17 mm. diameter and at prices varying from 1s. to 2s. 8d. per dozen.—Chater-Lea, Ltd., 74-84, Banner Street (Golden Lane), E.C.

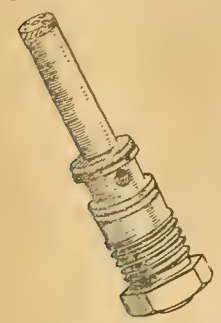
A Quick Petrol Filler.

Our illustration shows a very neat device for enabling a petrol can to be emptied directly into the tank without spilling the liquid. The funnel-shaped end fits over the nozzle of the can, and while the spring arms hold it up to its

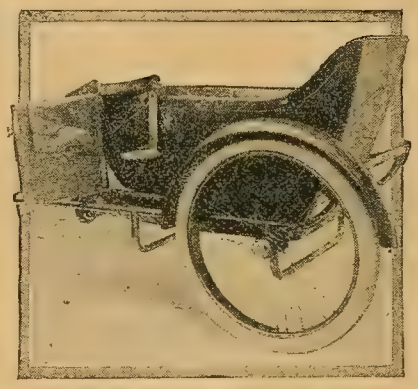


Atlas Empty Quick petrol filler.

work a rubber washer fits round the thread and prevents leakage. The petrol leaves the filler for the tank through several large gauze-covered slots, thus being thoroughly filtered. A tubular cover, flanged at its upper end, covers the gauzes in the normal position, but when it is required to transfer the petrol to the tank it is only necessary to invert the can, placing the flange on the top of the tank. The weight of the can then automatically uncovers the gauzes, against the pressure of an enclosed spring. A slight turn of the flange will keep the ports uncovered until the last drop of petrol is emptied The filler is known as the Atlas Empty Quick, and is sold by the Atlas Non-puncture Inner Case Syndicate, Ltd., 124 High Street, Kensington.



An atomizing jet by Jackson and Co. The cap has four tiny holes.



A sidecar by the Premier Motor Co., with child's seat in front.

A Simple Child's Seat.

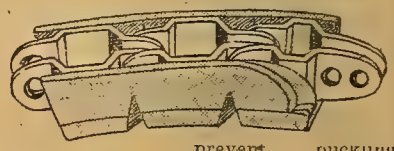
The illustration shows a model of the P.M.C. sidecar in which a child's seat is incorporated. The seat is made of a strip of mild steel, and is supported from the sidecar by two strong bolts. It is neatly upholstered in Pegamoid, and part of the front of the body is cut away to give a comfortable support for the child's back. The seat may be swung into, or out of, position.

The Premier Motor Co., Ltd., Aston Road, Birmingham.

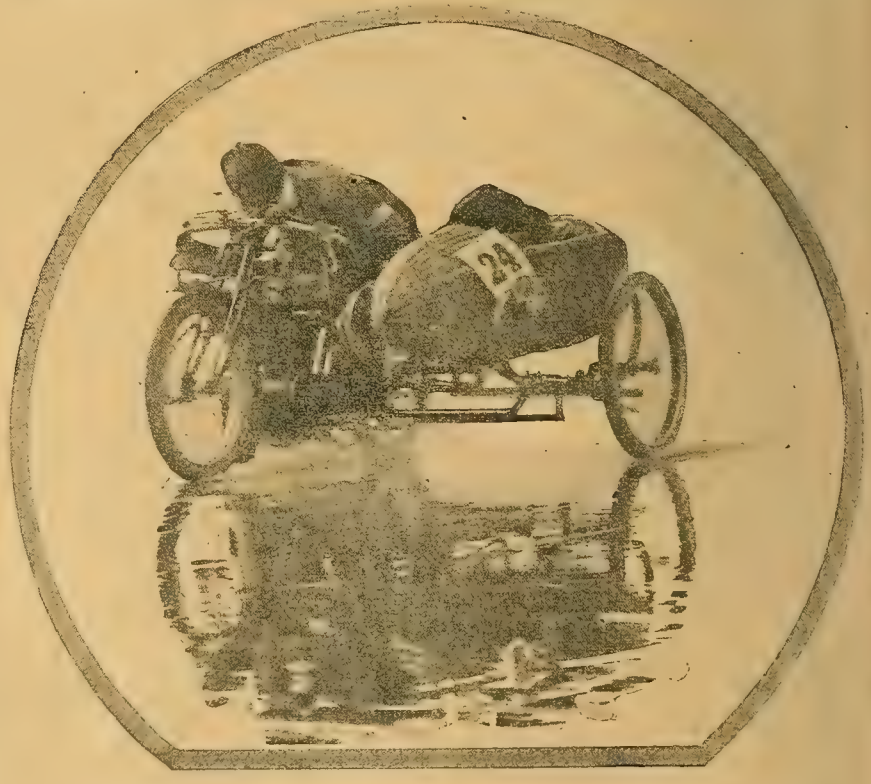
A Steel and Leather Belt.

We have received a section of a new belt of unusual construction which should prove interesting to those who complain of belt stretch.

The belt is composed of a light chain made up of V section steel links, connected by steel rivets, all wearing parts being carefully hardened. This chain is embedded in a raw hide cover, which has small pieces cut out between the links to



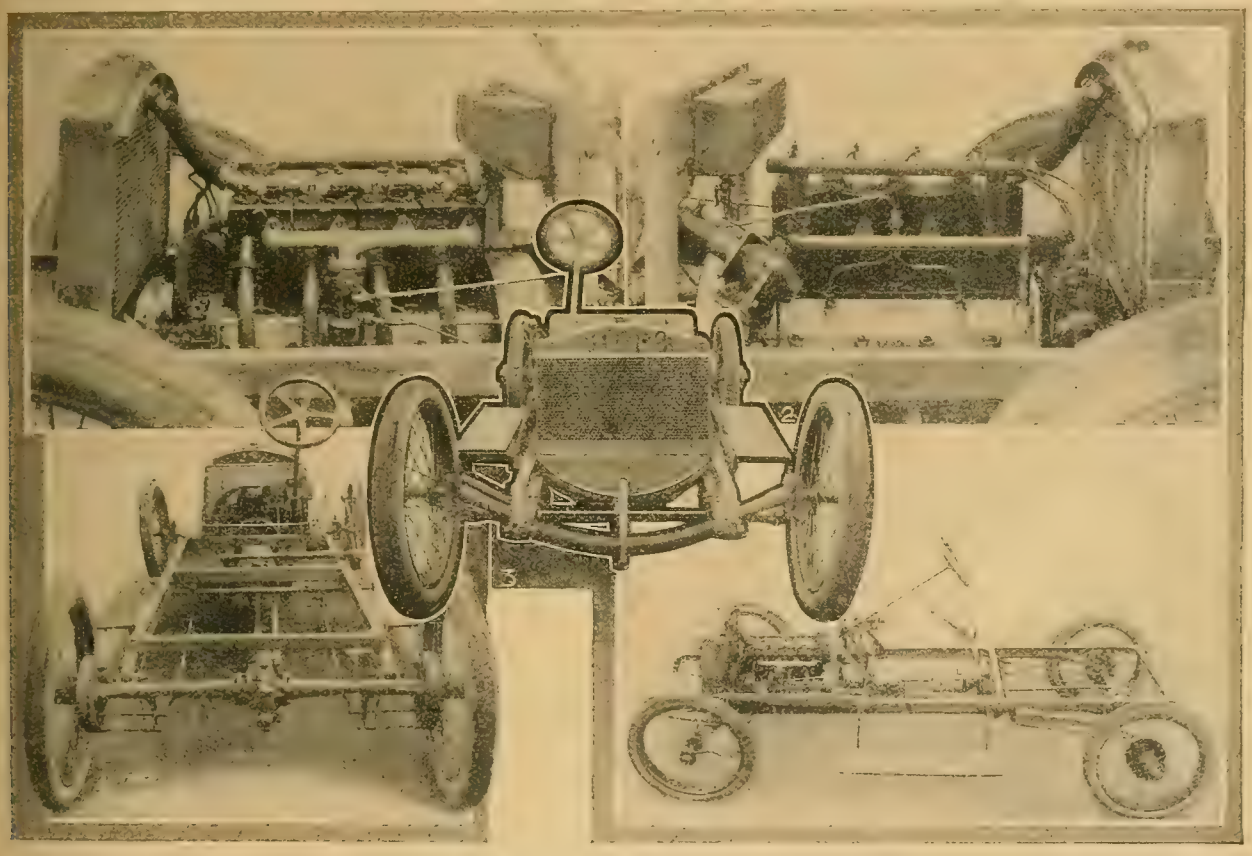
prevent buckling when the belt passes round the small pulley. Stout leather blocks are riveted to the bottom of each link and relieve the links from much of the side strain. Three double hole adjusting links are provided with each belt, each hole giving a ½in. adjustment. The fastening is a simple form of pin and cotter, thus no belt punch or fastener is required. The belt is known as the Morriss American belt, and it is claimed to have done over 30,000 miles on the road without trouble. Its price is 4s. 9d. per foot, and it is being handled by Frank Morriss, 169, Queen's Road, Finsbury Park, London, N.



A striking snapshot of sidecars racing on the beach at Porthcawl. The wet sands showed up the reflections almost perfectly, some of the photographic results being very effective.

Progress at the T.M.C. Works.

THE Wilkinson T.M.C. Co., Ltd., Oakley Works, Southfield Road, Acton, W., are now turning out a new 7-9 h.p. motor bicycle, specially designed for sidecar work. The bore and stroke of the engine are 65 × 75 mm. instead of 60 × 75, and the latest cylinders are flush-sided, which greatly adds to their appearance. The company are also busy manufacturing cycle cars which are fitted with engines of the same dimensions as above. The chassis has been considerably altered since it was last exhibited at Olympia, and the following details will be of interest. For example, the latest type of engine is used, and both to the cycle car engine and to that fitted to the motor bicycle a Claudel carburetter is supplied. The valves of the cycle car engine are now enclosed, and fibre-ended tappets are fitted to deaded noise. The water pump and magneto are carried across the front of the engine, while the oil pump is below the crank case. There is a universal joint between engine and gear box, and the brakes are compensated. The front axle is of the curved tubular type. The change-speed gear is in a gate similar to that formerly employed on Rover cars. The ends of the threequarter elliptical springs are now held in a special casting bolted to the sides of the chassis, and the engine and gear box are carried on a channel steel under-frame.



THE LATEST WILKINSON T.M.C. FOUR-CYLINDER CYCLE CAR.

(1) The engine from the valve side. (2) Off side view showing magneto position. (3) Front view. The distinctive type of radiator will be noted. (4) Rear view of chassis. The shaft drive, engine position, and general arrangement are gathered from this view. (5) Broadside view of chassis.

YORKSHIRE CLUBS' TWO-DAY RELIABILITY TRIAL.

The annual two days' reliability trial of the Harrogate and District Motor Cycle Club was held last week-end over the following course: Harrogate, Pateley Bridge, Greenhow Hill (observed), Grassington, Kidstones Pass (observed), Hawes, Kendal, and Ambleside, stopping place for the night. On the following day Kirkstone Pass, including The Struggle, was observed, and then the course ran by Lake Ullswater to Penrith, Hartside Pass (observed), Barnard Castle, Richmond, Aysgarth, Kidstones Pass (observed), Pateley, Yorkes Folly or Guy's Cliff (observed), Otley, Norwood Edge (observed) to Harrogate. Distance, about 260 miles. Numerous checks were arranged and no adjustments were allowed in any of the controls. Results:

Class I., for any Machines.—Lost no marks: W. Fawcett (5 A.J.S. sc.), W. B. Atkinson (2¾ Douglas), and F. Strafford (3½ Triumph).

E. Maynard (3½ Triumph), lost ten marks, failed on Kirkstone; E. Hawkes (3½ Rudge-multi), lost twenty marks, tyre trouble; R. Swift (3½ Bradbury), lost sixty marks, failed Kirkstone, Hartside, and Yorkes Folly; G. E. Hawkins (3½ Rudge), retired.

Class II., not sufficient entries.

Class III., for Passenger Combinations below 600 c.c.—H. W. Fortune (3½ Premier sc.), lost no marks; F. Wray (3½ James sc.), failed Kirkstone and Hartside, and retired; W. E. Grange (3½ Bradbury sc.), failed on Kirkstone and retired.

The remainder of the entrants either did not start or expressed their determination of stopping the second day in Lakeland. F. Strafford wins a special medal for climbing all observed hills on a fixed gear machine, and H. W. Fortune wins a special medal for climbing all observed hills on a 3½ h.p. sidecar combination.

Liverpool to Edinburgh and Back.

Rain Renders the Night Journey Very Trying.

AT 9 p.m. on Friday night a large crowd assembled at the Sefton Arms, Aintree, which is just outside the Liverpool City boundary, to see the Mersey Club start their twenty-four hours trial. The hotel, like all others in this part of Lancashire (outside the city), was closed at 2 p.m. on account of the farm labourers' strike. Of the fifty entries forty started, composed of twenty singles, sixteen sidecars, and four cycle cars. The night was cool and dull, and the crowd excited and bright. They showed their confidence in the riders' skill by only allowing them a passage a yard wide to ride through for the first couple of hundred yards. Prompt to time, the first man, S. Carty, was despatched, followed at minute intervals by the rest. The police were of considerable assistance, being stationed at all the turns to control the traffic.

The first mishap was past Garstang, about forty miles from the start, when H. W. Coopland (Indian sc.) went too fast round a corner, ran into a hedge, twisted his frame, and had to retire. He says he was following the curve of the telegraph wires and poles, as it was too dark to see the curve of the road properly. At this spot the wires took a "short cut" in place of following the road.

A Long Period of Rain.

While we were having supper at Kendal it commenced to rain, and this continued all the way to Edinburgh, making it unpleasant and greasy; many tyre troubles were reported. The test on the observed hill in the non-stop section of Haysyke, about forty miles past Carlisle, was the cause of a lot of grumbling. Many say they did not realise the sharp turn till past it and so had to dismount.

The return journey provided more excitement. Dr. Montgomery turned his 8 Morgan upside down at Longton and smashed a wheel. Fortunately, he was not hurt. W. Davis, on the smallest machine in the trial, a 2½ Victoria, hit a cow on the nose with his shoulder without coming off. W. E. Smith (4 Hobart) had his exhaust lifter wire pull out of the nipple, and to start had to put a washer between the tappet and valve each time. So he fastened the washer on a wire and pulled it clear after it had acted as a decompresor. We heard a rumour that L. V. Barton (6 Rex) returned without any piston rings and on two borrowed covers. A. C. Naylor (2¾ Douglas), near Penrith, in avoiding another competitor, was run into by W. H. Youd. M. Rimmer (3½ Zenith) had four punctures, and his butted tubes rubbed their butts off. E. F. Jenkins (Morgan) had trouble, and H. Gibson (3½ Bradbury) had to attend to plug and belt.

At the finish the first man to arrive was S. W. Carty (3½ Ariel), followed by N. H. Brown (7 Indian) and L. Mogridge (3¾ Mead-Precision). The 8 h.p. Crouch cycle car would not be started with the handle, so had to be pushed off each time. It was driven by J. A. Yeoman, and gained a silver medal on its first trial. The crowd at the finish blocked the road, wide as it is at this point, and the police had great difficulty in keeping a track open wide enough for the sidecars to finish.

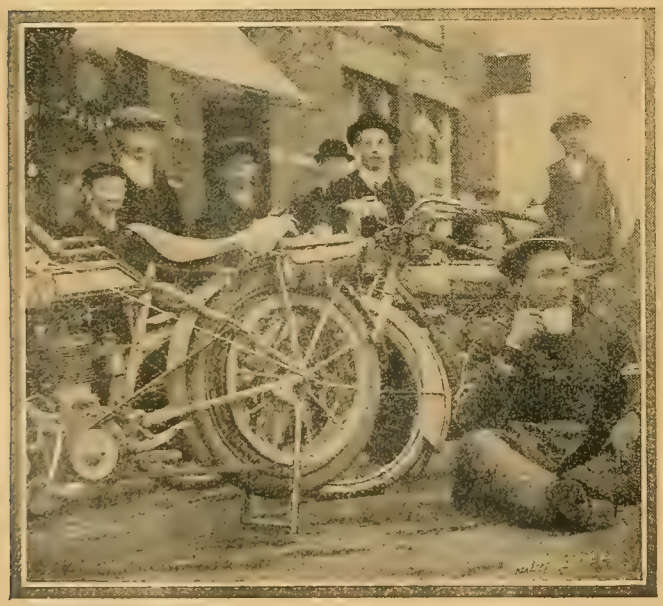
The results show that of the twenty singles to start eleven gained gold medals and six silver. Of the sixteen sidecars five obtained gold medals and three silver. Two cycle cars get silver medals. After the timekeepers had gone through the checks, they awarded (subject to stewards' confirmation later) the Timson Cup to H. Gibson (3½ Bradbury). Results:

GOLD MEDALS.

H. Gibson (3½ Bradbury)	A. C. Naylor (2¾ Douglas)
S. W. Carty (3½ Ariel)	W. H. Youd (3½ Matchless)
N. H. Brown (7 Indian)	W. H. Kelly (8 Rex-Jap)
L. Mogridge (3¾ Mead-Precision)	W. H. Longton (3½ Alldays sc.)
G. A. Gregson (5 Bat)	W. Davies (2½ Victoria)
N. Howarth (3½ Bradbury)	J. McG. Lamb (6 Clyno sc.)
C. M. O'Connor (5 Rudge sc.)	L. R. Pearson (6 Clyno sc.)
J. J. Day (3½ Bradbury sc.)	C. V. Freeman (6 Clyno sc.)

SILVER MEDALS.

L. V. Barton (6 Rex)	A. Cadwallader (3½ Humber)
F. C. Jones (10 Singer c.c.)	A. J. Jenkins (3½ New Hudson sc.)
J. A. Yeoman (8 Crouch c.c.)	H. J. Beal (4 L.M.C.)
A. G. Cocks (2½ Connaught)	M. Rimmer (3½ Zenith)
G. Wray (6 Clyno sc.)	G. Nott (6 Clyno sc.)
A. Marston (6 Dot)	



S. W. Carty (3½ h.p. Ariel) and N. H. Brown (7 h.p. Indian) stop for a cup of tea near the finish of the Mersey M.C. open 24 hours' trial.

OPEN SIX HOURS' RACE.

THE next event to be held on Brooklands by the B.M.C.R.C. will be an open six hours' race for motor bicycles, sidecar combinations, and cycle cars, starting at 11 a.m. on Wednesday, July 16th. The idea is that in this race everyone shall have an opportunity of breaking a record. The stewards of the meeting are Col. H. C. L. Holden, R.A., C.B., F.R.S. (president of the B.M.C.R.C.), Admiral Sir R. K. Arbuthnot, Bart., and the Rev. E. P. Greenhill. The entry fee is £2 2s. for non-members and £1 1s. for members. Entries close at mid-day on Tuesday next, 8th inst.

The usual motor bicycle class ratings will be used, while sidecar machines will be divided into classes up to 350, 500, 750, and 1,000 c.c., and four-wheeled cycle cars into two classes, up to 750 and 1,100 c.c. Machines are classified as follows: Division I., motor bicycles; Division II., sidecar combinations and three-wheeled cycle cars; Division III., four-wheeled cycle cars. All vehicles in Division II. and III. must be built to carry two passengers, and both seats must be occupied throughout the race. The minimum weight of driver and passenger is fixed at 140 lbs.

The start and finish are at the Fork, where, also, replenishment depots will be established. Each competitor will be entitled to have one assistant only.

A handsome silver cup, presented by Mr. H. H. Collier, will be awarded for the best performance in Division I.

The B.M.C.R.C. standard silver cup will be awarded for the best performance in each of Divisions II. and III.

A gold medal will be awarded for the best performance in each class, a silver medal for the second, and a bronze medal for the third.

All competing motor bicycles must be fitted with the regulation round disc number-plate, and also suitable brackets and screws for the attachment of front number-plates, which must be $\frac{3}{16}$in. thick, 8in. long, and 7in. broad, with a $\frac{5}{16}$in. hole in each corner 1in. from each edge. These brackets must be fitted so that there will be a clear and uninterrupted view of the plate from the front. Any machine not equiped with numbers as required will be disqualified at the start.

First Open Cycle Car Hill-climb.

Good Speeds Accomplished at the Cycle Car Club's Event. Long Drawn-out Proceedings.

THE Public Schools M.C.C. had organised a run to South Harting on Saturday last to witness the Cycle Car Club's open hill-climb at South Harting, so we joined them at the Bear Hotel, Esher, and after a few minutes' chat we left for Petersfield. There was quite a good gathering (about fifteen or twenty), among whom we noticed C. Q. Roberts and his brother, G. C. Barton, E. L. Moxey, C. Burney and his brother, and Clive Preen. It was a merry little party, and we made good time to the top of Hind Head, where we all stopped to admire the view. We reached Petersfield just before lunch and, visiting the station, found Dr. Low, Messrs. Westall and Selwyn just finishing their labours, which consisted of weighing in the competing vehicles.

The official hotel was the Dolphin, whose proprietor, not having been warned of the event by the club, was hard put to it to cater for the somewhat large crowd. His efforts were not rewarded with great success, but that was not his fault, and he did his best. After lunch we proceeded to the hill, which is just out of South Harting, a pretty Sussex village. The hill, which has a maximum gradient of 1 in 7, winds up the flanks of the Sussex Downs, and has a somewhat loose surface. It has been the scene of many hill-climbs, of which, perhaps, the most famous was one organised by the R.A.C. in 1905.

The Modus Operandi.

The competing vehicles were all marshalled at the foot of the hill and sent up when the signaller at the top made known that the cycle car just started had reached the summit. No vehicle was allowed to start till its predecessor had finished the climb, and so the time taken to send the competitors up the hill was considerable. The flagging was efficiently carried out by members of the Public Schools M.C.C. The first competitor was due to start at 3 p.m., but it was 3.23 before any one reached the steepest portion half-way up the hill. This was A. W. Lambert in Class IV., who came up at a terrific speed on his Grand Prix Morgan, the front wing of which was loose and blown back vertically by the wind. His was an excellent performance. Parnacott in Class III. came next, making a good ascent, considering the small size of his engine.

A Machine on Fire.

Meanwhile news came to hand that Welham had failed just after the start, and Holzapfel's machine had caught fire before starting, and after the flames had been extinguished he failed to get going. Buckingham (Chota) made a fine climb, but his exhaust was abnormally noisy. Kreitmeyer (Zebra) came up well, but slowly. Next came McMinnies on a Grand Prix Morgan at a splendid speed. His inner tube as he passed the steepest portion swelled out like a balloon as part of the tyre left the rim, and did not burst till he was out of sight, but in spite of this he made a capital performance. Spencer (Morgan) travelled well, but there seemed to be a good deal of back wheel slip on the loose surface. Lambert (Morgan) in Class IV. came up well, and so did Martin (Singer), whose engine seemed in excellent tune, and emitted a healthy hum. Armstrong's (Armstrong) ascent may be described as fair. Bradley (Duo) did well, Naylor (G.N.) made a fair ascent, and Wood and Lieut. L. Hook, R.N. (G.W.K.s) came up in excellent form. Halsall's Wilton ran splendidly till some way past the steepest portion, and then stopped. Nash (G.N.) came up fast, but his exhaust was much too noisy. Whitehead, on a similar machine, came up nicely, but was apparently over-geared. The two G.N.'s were those entered for the Grand Prix. Chater-Lea, jun., showed up well on the Chater-Lea, and so did Higgs (G.N.). Among the unfortunates, Vallat (V.C.) broke his counter-shaft at the start, Turner (Truner) broke his chain, Furneaux (Swift) failed owing to a fouled plug, Lord Exmouth (G.N.) stopped at the second bend, and Barrett (Crouch) failed owing to the carburetter running dry. Holzapfel again made an attempt to start and his machine again caught fire.

A. W. Lambert (8 h.p. Morgan) finishing with one of his front mudguards flying, an incident which might have robbed the driver of fastest ascent of the day.

J. F. Buckingham (Chota) travelling well in the 750 c.c. class, which he won.

The Intervals.

The chief failure in the organisation was the allowance of too long an interval between the competitors, which sorely tried the patience of the spectators as well as the honorary officials who flagged the hill. The following are the times made by the successful competitors:

CLASS I.—SINGLE-SEATED CYCLE CARS UP TO 1,100 C.C. (three or four wheels; awards on formula only).

Name.	No. of Cyls. and Car.	Bore and Stroke. mm.	Weight of Machine. c. q. lb.	Weight of Passengers. st. lb.	Time. m. s.
A. W. Lambert ..	2 Morgan ..	90 × 77.5	5 0 14	9 7	1 58⅘

First Open Cycle Car Hill-climb.—

CLASS III.—FOUR-WHEELED CYCLE CARS UP TO 750 C.C. (two-seated).

J. F. Buckingham	1 Chota ...	89 × 120	6	1	10	21	10	2 20⅘
A. E. Parnacott ..	4 Parnacott ..	52·5 × 57	6	3	0	21	10	4 4⅘
K. Kreitmeyer ..	1 Zebra ...	88 × 106	9	3	0	21	6	5 26⅖

CLASS IV.—THREE-WHEELED CYCLE CARS UP TO 1,100 C.C. (two-seated).

W. G. McMinnies	2 Morgan ..	90 × 77·5	5	2	0	24	4	1 43
A. W. Lambert ..	2 Morgan ..	90 × 77·5	5	0	0	21	7	2 0⅕
S. W. Spencer ...	2 Morgan ..	90 × 85	6	0	0	21	4	2 7⅕

CLASS V.—FOUR-WHEELED CYCLE CARS UP TO 1,100 C.C. (two-seated).

A. G. F. Nash ...	2 G.N.	84 × 98	6	0	7	20	3½	1 50⅘
L. Martin	4 Singer ...	63 × 88	11	1	0	21	1	2 14
J. T. Wood	2 G.W.K. ..	80 × 92	9	2	7	21	1	2 14⅕
C. M. Whitehead	2 G.N.	84 × 98	6	1	14	21	13	2 41
G. N. Higgs	2 G.N.	84 × 98	8	0	0	21	4½	2 56⅘
E. H. Armstrong	2 Armstrong	85 × 85	6	2	0	20	0	2 56⅘
N. Naylor	2 G.N.	85 × 85	6	1	7	22	8	2 58⅘
J. Chater-Lea, jun.	2 Chater-Lea	85 × 85	8	2	14	21	1½	3 0
A. P. Bradley ...	2 Duo	85 × 85	9	3	0	22	9	3 19
Lt. L. Hook, R.N.	2 G.W.K. ..	86 × 92	10	1	0	21	10	3 39

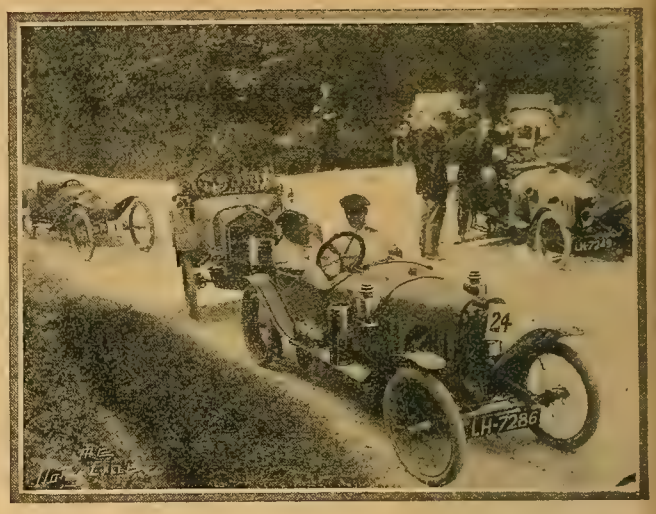
In Classes III., IV., and V. the awards are granted on both time and formula. The latter was as follows:

$$\frac{W}{(C-K)\ Tp}$$

W = Weight.
C = Cubic capacity.
K and = p Constants for length and gradient.

The judges were Dr. A. M. Low, D.Sc., and Mr. Glyn Rowden. We made the journey both ways on one of the new 3½ h.p. Motosacoches, which ran magnificently and had an excellent turn of speed.

After leaving Petersfield, a number of members of the Cycle Car Club left for Selsea, while the Public School M.C.C. went to Havant for the night.



Scene at the foot of South Harting Hill near Petersfield. Lord Exmouth at the wheel of his G.N. At the left of the picture is the Carden.

CLUB NEWS.

East Essex M.C.C.

A reliability trial was held on the 21st ult. The course was as follows: Colchester, Ipswich, Stowmarket, Thetford, Bury St. Edmunds, Sudbury, Halstead, Colchester. The results are as follows: 1, J. C. Bland, junr. (2¾ Douglas), 93%; 2, D. H. Morgan (7 Indian), 87%; 3, A. Gardner (2¾ Douglas), 85%; 4, W. F. Pemberton (3½ Triumph), 80%.

Middlesbrough and District M.C.C.

There were twelve competitors in the 200 miles reliability run for the Gjers Cup on the 25th ult. The route, commencing at Marton Bungalow, was *viâ* Guisborough, Whitby, Scarborough, Malton, York, Tadcaster, Harrogate, Ripley, Ripon, Pateley Bridge, Leyburn, Northallerton, Leven Bridge, and finished at the Bungalow, Marton. C. W. Smith (83 marks) secured the Gjers Cup and gold medal, H. V. Taylor being second, and F. Dixon third.

Airdrie and Coatbridge M.C.C.

A flexibility hill-climb was held on the 25th ult., resulting as follows:

Single-cylinder class.—1, J. Jefferson (4¼ Excelsior), fast climb 45⅘s., slow 2m. 40s., figure of merit 3.4; 2, W. D. Craig (3½ T.T. Triumph), fast 41⅗s., slow 2m. 3⅗s., figure of merit 3.0; 3, J. Darroch (3½ Rudge), fast 40s., slow 1m. 46⅗s., figure of merit 2.6.

Twin class.—1, B. Boyle (8 Matchless), fast 43⅗s., slow 2m. 53⅕s., figure of merit 3.9; 2, D. Grimson (8 Matchless), fast 42⅘s., slow 1m. 56⅖s., figure of merit 2.7.

Surrey M.C.C.

The annual trial from Guildford to Exeter and back took place on the 17th and 18th ult., there being thirteen starters, including four sidecars. Several others accompanied the run, although not competing. The return journey was made by way of Lyme Regis and Dorchester. Owing to a bridge being under repair near Seaton, a *détour* had to be made on to the beach to reach Lyme. The roads throughout were in a very loose condition owing to the dry weather, and tyre trouble was frequent. The following finished within one hour of schedule time: 1, S. Holbrook Crow (8 Chater-Lea sc.); 2, P. Mitchell (3½ Premier); 3, L. A. Lymposs (3½ Triumph). The above scored non-stops, and were within the time margin at all controls. 4, T. G. Meeten (3½ Rudge); 5, C. Acheson Crow (2½ Singer); 6, H. J. Oates (3½ Singer); 7, H. P. Burch (3½ P. and M.) The above scored non-stops, but were early or late at controls. 8, E. Cox (6 Zenith sc.); 9, C. J. Feeny (3½ Triumph); 10, H. Mitchell (3½ Premier).

There will be a speed trial at Clandon Park, near Guildford, on the 16th inst.

Cheltenham M.C.C.

A petrol consumption trial was held on the 11th ult. over a hilly course which resulted as follows:

CLASS I. (For solo machines).—1, W. B. Gibb (2¾ Douglas), 170 m.p.g.; 2, E. Colwell (3½ Triumph).

CLASS II. (For sidecars and cycle cars).—1, Mrs. E. M. Baker (6 Zenith sc.)

A Royal Enfield Reliability Trial.

On Wednesday last week, a trial for amateur owners of Royal Enfield motor cycles was held, a special permit having been granted by Mr. A. I. Greenwood for the event. The course was to Aysgarth and back, a distance of 110 miles, Kidstone Pass (a steep hill in the 1911 A.C.U. Six Days' Trial) being included. The winner proved to be Hy. Hodge, of Leeds, who was mounted on a 6 h.p. sidecar combination. He was awarded the twenty guinea silver challenge cup for one year and a gold medal.

Ready to start from the City Square, Leeds, in the Royal Enfield reliability trial.

Club News.—

Wimbledon M.C.C.

The result of the second club trial is as follows: 1, R. C. Martin (Triumph); 2, H. W. Bull (Triumph); 3, C. Stacey (Douglas).

The Brookdale Club, Catford.

The night trial held on the 21st ult. resulted in a win for H. A. Cooper (3½ Bradbury sc.), with S. Gibson (6 Enfield sc.) and F. Kennard (6 Matchless) second and third.

Sheffield and Hallamshire M.C.C.

On the 21st ult. there was a 300 miles reliability trial to Carlisle and back for the Bisby Trophy, presented by the president. For some unaccountable reason only six competitors faced the starter. Results: 1, D. Bradbury (3½ Rudge), winner of the trophy and prize, lost 1 mark; 2, Sawer (3½ Premier), lost 4 marks; 3, Swan (3½ Rover), lost 11 marks.

Leeds M.C.C.

The final run off of the Beulah hill-climb took place on the 21st ult. Result: 1, C. Foster (3½ h.p. Bradbury sc.), 51⅜s.; 2, C. Benn (3½ h.p. Triumph), 41⅘s. After this event a minor speed-judging competition was held, with the following results:

SIDECARS.

	Time allotted.	Actual time.	Difference.
A. Lees (6 Dot)	65s.	69⅘s.	4⅘s.
— Green (3½ Rudge)	67s.	72⅖s.	5⅖s.
A. T. Jenkins (3½ Triumph) ...	97s.	103s.	6s.

SOLOS.

R. Cawthorne (3½ Cawthorne) ...	75s.	75⅕s.	⅕s.
R. Kirk (3½ Triumph)	54s.	52⅖s.	1⅕s.
C. Benn (3½ Triumph)	56s.	53⅗s.	2⅕s.

Hamilton and District M.C.C.

A speed test was held on the 21st ult. over half a mile on the Carlisle Road. Results:

500 c.c. CLASS.—1, J. Darroch (3½ Rudge), 31s.; 2, R. Torrance (3½ Premier), 33⅕s.; 3, J. Clelland (3½ Rudge), 35⅕s.

650 c.c. CLASS.—1, Dr. Totheringham (3½ Bradbury), 30⅜s.; 2, J. Darroch (3½ Rudge), 30⅜s.; 3, R. Walker (5-6 A.J.S.), 37⅕s.

T.T. CLASS.—1, J. Darroch (3½ Rudge), 28⅘s.; 2, R. Torrance (3½ Premier), 31⅗s.; 3, Wm. Rodger (3½ Triumph), 33s.

ANY CAPACITY CLASS.—1, J. Sword (8 Matchless), 26s.; 2, J. Brown (7 Indian), 29s.; 3, J. Darroch (3½ Rudge), 30⅖s.

The results of a petrol consumption contest which was run off on the 11th ult. on formula were as follows: 1, T. Gibson (7 Indian); 2, Wm. Scott (5 Indian); 3, R. W. Brown (7 Indian); 4, J. Low (3½ Triumph); 5, Wm. Rodger (3½ Triumph); 6, Dr. Totheringham (3½ Bradbury).

Armstrong College M.C.C.

A hill-climb was held by this newly formed club recently near Rothbury. Result: Handicap. 1, Jackson (Dene-Precision); 2, H. Hunter (Dene-Precision); 3, Stead (2¾ Douglas). Scratch Race: 1, Philip (Matchless); 2, Lynch (N.U.T.)

Belfast and North of Ireland M.C.C.

A hill-climb was held on the 14th ult. at Carnmoney. Result:

CLASS I.—1, Francis Willochs (3½ Jap); 2, R. McKibben (3½ O.K. Precision); 2, John Robb (3½ Jap).

CLASS II. (Flexibility.)—1, James Miller (3½ Campion-Jap); 2, John Robb (3½ Jap); 3, Francis Willochs (3½ Jap).

A reliability trial of 200 miles will be held on July 12th.

Manchester Hundred M.C.

The Manchester Hundred Motor Club were favoured with glorious weather for their 100 miles novices' open reliability trial for motor cycles, sidecars, and cycle cars. The competition was confined to amateurs who had never won a prize in any open reliability trial, and an entry of forty was obtained, thirty-six of whom faced the starter at the Ram's Head Hotel, Disley. The results were as follows: 1, A. E. Dearnaley (3½ B.S.A. sc.); 2, S. P. Dawson (3½ Kynoch); 3, E. Robson (G.W.K. cycle car). The winner, A. E. Dearnaley, was enthusiastically chaired by his colleagues round the hotel grounds.

Newcastle and District M.C.C.

A hill-climb has been held on Lakeside near Rothbury. Results:

350 c.c. class.—R. Scoon (N.U.T.) beat G. Raper (A.J.S.)

500 c.c. class.—W. Atkinson (Rudge) beat R. B. Smith (B.S.A.)

775 c.c. class.—R. Scoon (6 Nut) beat C. Armstrong (Ivy-Precision).

1,000 c.c. class.—H. N. Hull (6 Matchless) beat J. Hodgson (6 Matchless).

Passenger class.—R. Bradford (8 Matchless) beat F. Oliver (8 Chater-Lea).

Oxford M.C.C.

A hill-climb took place at Whiteleaf Hill, Monks Risborough, on the 19th ult., in connection with the Mid-Bucks M.C.C. Results:

Class A (under 350 c.c.).—1, H. G. Hill (2½ Calcott), Oxon; 2, C. Dickinson (2½ Singer), Bucks.

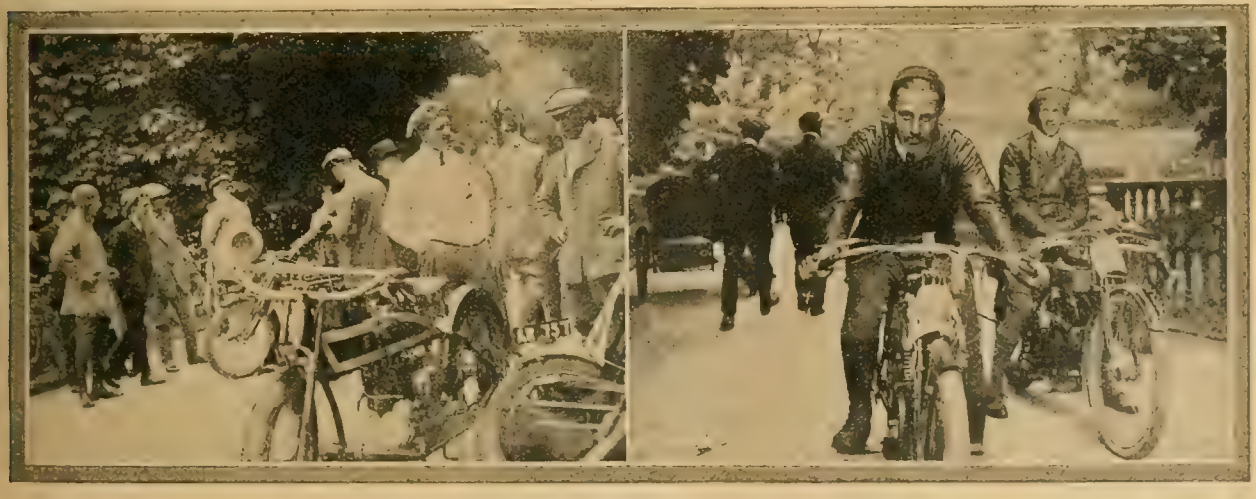
Class B. (under 500 c.c.).—1, H. G. Hill (2½ Calcott), Oxon; 2, G. W. Russell (3½ Rover), Bucks.

Class C. (under 500 c.c., variable gears).—1, H. L. Turner (3½ Rudge), Bucks; 2, C. B. C. Loxley (3½ Triumph), Oxon.

Class D. (passenger machines).—1, H. R. Annis (3½ New Hudson), Oxon; 2, A. James (6 Zenith), Oxon.

The Oxford M.C.C. won four events to nil.

Fastest time of the day.—1, G. W. Russell (3½ Rover), 57⅕s.; 2, H. G. Hill (2½ Calcott), 57⅗s.



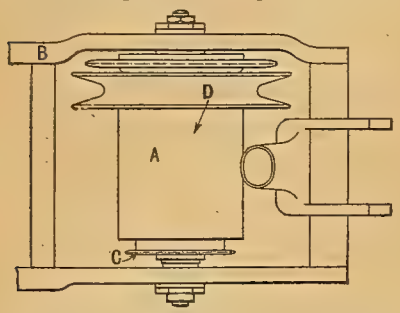
HERTFORDSHIRE M.C.C. SPEED TRIALS IN LUTON HOO PARK.

H. G. Hill and E. H. Lees examining the four-cylinder Henderson, which machine caused a good deal of interest

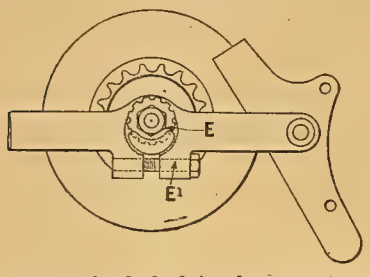
A. J. Dixon (Singer) and W. F. Newsome (Douglas) who shared a number of premier awards.

The Hazlewood Counter-shaft Gear.

A three-speed hub A, such as the Armstrong, is mounted in a bracket B on the frame. The drive is by chain from the engine to the sprocket C, and



from the hub shell to the rear wheel by means of the pulley D. Adjustment of the chain is effected by providing the hub with an eccentric mounting E,

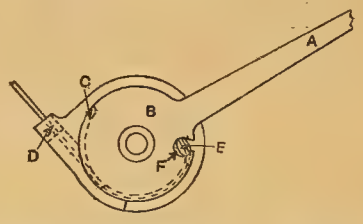


which can be locked in the correct position by a clamping bolt E¹.—Hazlewoods, Ltd., and A. Walsgrove, No. 22,585, 1912.

PATENTS by Eric W. Walford F.C.I.P.A.

Bowden Wire Attachment.

The inventor of this lever is endeavouring to produce a more substantial construction with easy detachment of the wires. The lever A has a circular plate B in the periphery of which is cut a groove C for the reception of the Bowden inner cable D. This cable is provided with a stop E which can be passed through a reduced aperture into a cavity F. When inserted in this cavity the pull on the wire turns the stop E into such a position that it cannot pass out



through the reduced aperture and it is accordingly held securely. Detachment can be effected by slacking the wire so that the stop can turn round and pass out of the cavity.—A. A. Scott, No. 27,418, 1912.

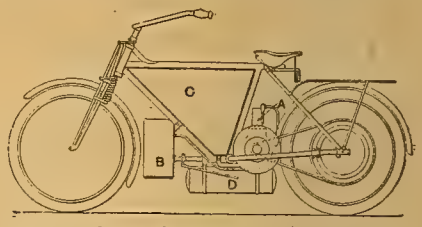
A Driving Belt.

This is an articulated transmitter composed of blocks of leather A B arranged vertically and overlapping one another,

being connected by screws C. Intervening plates D of metal serve to strengthen the belt and prevent stretch. —W. R. Sleigh, No. 9,088, 1912.

A Steam Motor Bicycle.

On this machine the engine A is arranged between the chain stays, which are widened out near the crank bracket to accommodate the engine. The boiler or generator is arranged at B, and is supplied with water from the tank C, whilst the burner receives fuel under



pressure from the tank D. It is also suggested that the tank C inside the frame should be divided into two compartments, one for water, and the other for petrol or other fuel used.—H. Pearson and P. Cox, of Pearson and Cox, Ltd., No. 20,522, 1912.

New Telephone Number.

The telephone number of *The Motor Cycle* publishing offices in London has been changed to City 2848 (five lines).

New Address.

Kemps' Vulcanising Depot, of 19, Hardman Street, Manchester, the tyre repairers, have opened a branch at 125, Devonshire Street, Sheffield.

"The Autocar Handbook."

The fifth edition of *The Autocar* Handbook includes special chapters on cycle cars and miniature cars, which are likely to be of special interest to our readers. The whole of the text has been recently revised, and seventy pages of matter added. The chapter on "Ignition" includes large detailed illustrations explaining the working and construction of a magneto in the simplest possible manner. The price of the book is 1s. 9d., post free, from Iliffe and Sons, Ltd., 20, Tudor Street, London, E.C.

A New Series of Maps.

The proprietors of Horlicks malted milk have just issued a set of most excellent motoring maps, scale twelve miles to the inch, of England and Wales, Scotland and Ireland. They are beautifully clear and show distinctly first, second-class, and other roads, while the distances between towns are also given. Each map will be sent to any motor cyclists who forwards 3d. in stamps to Horlicks Malted Milk Co., Slough, Bucks, or the whole set of three may be obtained for the modest sum of 8d.

SPARKLETS

Belt Successes.

The successes of Pedley belts continue week by week. This week's list includes four firsts in Herts Open Speed Trials, both firsts at B.A.R.C., and eight new sidecar records from the km. to four hours at Brooklands.

Walthamstow Carnival.

Mr. G. Best, 91, Forest Road, Walthamstow, organising secretary for the carnival at Walthamstow, in aid of the Walthamstow and Tottenham Hospitals, to be held on Saturday, July 26th, will be glad to hear from motor cyclists who may care to take part in this event.

Maps and Guides.

An excellent map, printed with Messrs. Bartholomew's customary clearness and accuracy, is the Contour Motor Map of the British Isles, showing clearly the main through roads and the altitudes of different parts of the country. This map also shows plans of the cities of London, Manchester, Edinburgh, Glasgow, and Dublin, on a sufficiently large scale to enable the motor cyclist to find his way in or out.

Reviews.

"The Motor and Gas Power Pocket Book." International Correspondence Schools, Limited, Kingsway, London, W.C., 5s. A useful handbook for engineers, giving formulæ, mathematical tables, and a host of most useful information.

An Italian Order.

After tests extending over some months the Italian Government have just placed an order for a large number of motor cycles for its army, Italian makes being the ones favoured. English carburetters, however, were preferred, the British-made Amac being specified.

Luton Hoo Speed Trials.

In our report of the speed trials at Luton Hoo, it was stated that C. M. Down's Enfield would not run properly. We learn that the reason of this was an unfortunate collision before the event which caused damage that could not be rectified in time, and was in no way due to the machine itself, which, we understand, was the same that ran so steadily in the T.T.

Catalogues Received.

Chater-Lea, Ltd., 74-84, Banner Street, Golden Lane, E.C. (Chater-Lea cycle cars); Continental Tyre and Rubber Co., Ltd., Thurloe Place, London, S.W., ("Successes 1912." RUSHMORE

The most efficient method of illuminating the path of a Motor Cycle, Cycle Car, or Tricar is by means of RUSHMORE ACETYLENE LAMPS and GENERATORS. The 5in. Lamp projects a powerful beam of light a minimum of 300 feet, whilst the 4in. Lamp projects 200 feet. The former is priced at £1 15 0 and the latter at £1 7 6. The gas is generated in a simple and strongly constructed generator, on much the same lines as the popular Rushmore Motor Car Generator.

BRITISH MADE THROUGHOUT.

The new pocket catalogue should be in the hands of every motor cyclist, and a copy will be sent immediately on receipt of a postcard. Please mention "The Motor Cycle."

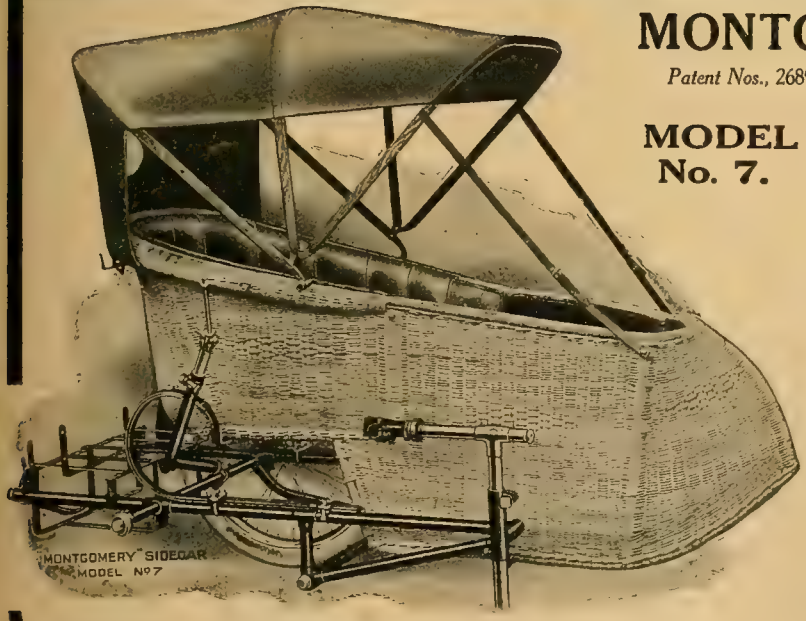
MONTGOMERY SIDECAR

Patent Nos., 26893/10, 26894/10, 26895/10. *Prov. Patent*, 24482.
Regd. Nos., 610486, 610485.



MODEL No. 7.

This is an entirely new model, produced in response to numerous enquiries for a sidecar of light construction for use with the standard 3½ h.p. motor cycle, but strong enough for hardest work, and which can be driven with confidence at the highest speed. Our registered design frame has enabled us to do this, and we strongly recommend it.

SPECIFICATION.—Code Word, "STATING."

CHASSIS.—New model registered design girder frame, giving a wide margin of strength for use with machines capable of high speeds. Made of finest quality weldless steel tubing. Extended at back for luggage.

SPRINGS.—Double leaf "C" springs, finely tempered and enamelled black. Front of body supported on our well-known patent transverse foot spring.

BODY.—New pattern best quality wicker, with deep seat and ample leg room, providing most comfortable riding. Upholstered, in best style and material, red, green, or tan to order. Complete with cushion and coverall apron in motor twill.

WHEEL.—26×2¼in., black enamelled rim, specially strong dustproof hub, axle turned from the bar. Michelin beaded-edge motor cycle tyre, or to order.

MUDGUARD.—Large size, brought well down over the wheel, and firmly secured to the frame.

ATTACHMENTS.—New patent quick-detachable attachments, provided with double security locks and our latest type of back fitting, which enables the axle to be adjusted in perfect alignment with the ground.

LAMP BRACKET.—Fitted on frame in front of mudguard.

FINISH.—Best black enamel, or colour to order. Usual parts heavily plated

WEIGHT.—About 78 lbs. **WIDTH.**—37in. overall, but will pass through 34in. doorway.

Price £12 0 0 as Specification.
„ £15 5 0 with Coach-built Body.
„ £15 5 0 with Art Cane Body.

ROC GEARS

For Solo use,
„ Sidecar use,
„ Hills,
„ Traffic,

ROC gears easily maintain their supremacy over all motor cycle gears. For powerful engines of 6, 8, 10 h.p., and more

ROC GEARS

are now provided with a big diameter clutch that grips and does not slip.

ROC gears are "fool-proof," and have the greatest efficiency.

The latest 1913 improved pattern have a double action adjustment, giving twice the movement.

ROC gears suit all makes.

ROC GEARS

are built on the live axle patent with hand starting.

ROC gears are silent running, perfectly smooth in action, and absolutely dependable.

The price, including fitting, is only

TEN GUINEAS.

There is no waiting.

Write and tell us the make and h.p. of your machine. The adoption of this gear will free you from all gear worries.

ROC GEAR Co.

Carburetters and Flexibility.

ENGINE flexibility is a matter worthy of more serious attention. In our leaderette of June 19th we suggested that the secret of slow running on top gear lies chiefly in the use of an automatic carburetter. This suggestion is thrust upon the public by the fact that the automatic carburetter is employed almost exclusively on cars for both touring and racing purposes, though, of course, multi-cylinder engines render the problem of the automatic carburetter much more simple. One has only to take a ride in a car of large horse-power and watch the driver picking his way through traffic on top gear merely by the use of one pedal, to appreciate fully the use of an automatic carburetter. We should very much like to see more attention paid to this most important factor of a sweetly running engine controllable at all speeds.

Accordingly we feel that some encouragement is necessary, and with this end in view we give it as our opinion that the A.C.U. would confer a great benefit upon the motor cycle public by organising a special trial either on Brooklands or preferably in a touring trial such as the forthcoming six days' event in Lakeland, in order thoroughly to test the automatic carburetter. The first prize should be awarded to the manufacturer whose carburetter gives (1) the fastest speed, (2) the slowest speed, and (3) greatest economy.

We are fully aware that pilot jets are here and there standard fitting, and carburetters provided with this device are a distinct advance on the ordinary type. Such a carburetter practically conforms with our ideals, but unfortunately the British manufacturer has not interested himself to any great extent in this fitting. To meet the demands of those who desire to use single-geared machines in traffic, manufacturers have devoted more time to the perfecting of the decompressor before seriously considering the undoubted advantage of a pilot jet device. One of the advantages that a pilot jet has over the decompressor is that, whereas a decompressor proper (this does not refer to the variable compression device) allows a large portion of the gas to escape, the pilot jet allows the engine to run on an infinitesimal amount of gas. In this way, there is a considerable saving in fuel.

In conclusion, we would again draw attention to the fact that the average motor cyclist would gladly undergo the pain of a decrease in speed by one or two miles an hour, provided he could obtain: (1) genuine economy without any decrease in power, (2) slow running on top gear and complete controllability even with the clutch out, and (3) good acceleration without misfiring.

Win, Tie, or Wrangle!

WE notice with regret a growing tendency, on the part of some few competitors in motor cycle competitions, to indulge in unsportsmanlike grumbles whenever they fail to win.

Now, in our opinion, one of the great advantages of sport, in the best sense, as practised in this country, is that a man learns to lose like a gentleman, and a true sportsman would rather lose a good game than win by any means which can be described as "not cricket"; it is, therefore, hard to comprehend the moral outlook of the man, who claims to have made a non-stop when such is not the case. We hope that there are not many such, but we are afraid that numerous riders allow themselves to make criticisms and complaints of trivial happenings when they are unsuccessful.

It should be remembered that nearly all the work in connection with club events is done by honorary officials, many of whom are business men, and consequently have only their spare time to give to the arrangements; this they do gladly, and no one who has not experienced it knows how much work the arrangement of a successful trial involves. To say the least, it is, then, somewhat ungracious to grumble, and we know many an enthusiastic worker who has been checked or disgusted by the petty quarrels. It is within our recollection that really good men, who at one time did an immense amount of work to forward the movement, have now dropped out altogether, and their names would be almost unknown to new converts. We can account to some extent for their retirement from motor cycling circles. Quite recently a writer accused the observers in a certain trial of unfairness—not to say dishonesty. (We think of having a w.p.b. of large size for communications of this sort and a bonfire every other day.) Such an accusation is, of course, preposterous.

The spirit which we wish to foster is one of emulation and scrupulous fairness. A man should win if he can, of course by fair means, and leave no stone unturned to secure the best possible result; but if he is beaten—it may be by bad luck—he should take his beating like a Briton and not indulge in petty and unsportsmanlike recriminations.

How I made a New Engine "Rev."

By "ROAD RIDER."

I RECENTLY took delivery of a new engine (500 c.c.), which was geared 4½ to 1 by its makers on the top ratio of its Sturmey-Archer hub. The first mile of open road showed that the machine would require a great deal of "running in," for it would barely touch 40 m.p.h., which meant an engine speed of less than 2,300 r.p.m. The only noticeable defect was that it would not take much extra air with the throttle full open on a very hot day. Examination showed that the carburetter was provided with a 32 jet and full-sized air cone; also that the float was half full of petrol. I substituted a new float, and a 38 jet, removing the air cone altogether. This made no difference to the running, though it considerably reduced the petrol consumption (from 55 m.p.g. to 80 m.p.g.) The next experiment was to advance the ignition timing a little, to drill six large extra air holes $\frac{1}{16}$in. in diameter, and to double the frequency of the lubrication.

Too High a Gear.

As a natural consequence the speed increased a little, but the gear seemed rather too high, for the machine would touch 45 m.p.h. on top gear (2,600 r.p.m.), whereas on the second gear of 6.6 to 1 it would do 42 m.p.h. (about 3,550 r.p.m.) I took the opportunity provided by every secluded mile of straight road to drive the engine all out on *second* gear (thus shortening the "running in" period by compressing the maximum number of engine revolutions into a minimum road distance), oiling it furiously all the time, and emptying the crank case of oil at every stoppage to avoid carbonisation. These experiments showed that the engine was almost equally fast on gears of 4½ and 6.6 to 1, a fact which indicated that higher speeds would be obtainable by lowering the top gear ratio; 4½ to 1 was too high, and on a 6.6 to 1 the buzz of the exhaust was too like a huge angry bee. So the next step was to substitute an automatic carburetter, which I will not name, because it is not on the market, and to lower the top gear to 5 to 1. The reduced gear proved a great advantage. On the 4½ gear the machine would have been unusable but for its three-speed hub; it picked up from a slow when hot very reluctantly indeed, and knocked most sinfully, so that I had been fain to change down on many quite insignificant hills no worse than 1 in 14 or so. But the 5 to 1 gear transformed the machine, which was now capable of 55 m.p.h. on top (about 3,500 r.p.m., which is splendid for *top* gear), while on its proportionately reduced second gear of 7.32 to 1, it could touch very nearly 4,000 r.p.m. when warm and well lubricated (between 40 and 45 m.p.h.) The great tip in tuning up is to test all adjustments *singly*, and to test them *on second gear*, at which the top pace is not unsafe on a deserted public road.

The Advantages of the Automatic Carburetter.

The next step was to make comparative tests of the standard two-lever carburetter and the automatic substitute, and with one important exception the two vaporisers produced identical results. Each carburetter gave a top speed of about 55 m.p.h. and a consumption of about 80 m.p.g. with the 38 jet and without an air cone. On each the machine could be driven at about 9 m.p.h. on top speed, though it was much easier to get smooth slow speed running with the single lever device. The factor which has led me to retain the automatic carburetter is that when it is fitted *the engine never knocks*, whereas with the two-lever device there is a cruel knock whenever the hot engine is picking up from 10 m.p.h., whenever I attempt to accelerate on a moderate gradient, and whenever I reopen the throttle after temporarily closing it for braking purposes. This indicates that *the knocking on this particular engine is solely ascribable to imperfect mixture*, the error being in the direction of weakness or excess of air; but, however careful I am in the setting of the two-lever device, I am unable to prevent a certain amount of knocking; and a novice would suffer from it more than I did.

A Forecast.

I know this particular make of engine pretty well, and I am able to prophesy about its future history. When I have covered 2,000 miles I shall have the entire engine down, clean away the accumulations of carbon, change the exhaust valve and spring, and raise the gear to 4¼ to 1. By this time every part will have bedded down nicely, and I shall expect to get 60 m.p.h. or a little over on the higher gear, *i.e.*, I shall get a higher road speed at 3,200 r.p.m. than I now get at 3,500 or 3,600 r.p.m. Similarly, I shall get a higher road speed on second gear; whereas I now get over 40 m.p.h. on a 7.32 gear, say 4,000 r.p.m., I shall then get nearly 50 m.p.h. on a 6.23 gear—say 3,900 r.p.m., and the acceleration on the bottom gear of 8¾ to 1 will be so certain and terrific that I could climb the worst freak hill with absolute ease, knowing that full engine power will leap smoothly into operation the instant the valve is dropped after rounding an acute hairpin. At present I should funk a bad freak hill even with my present bottom gear of 10.3 to 1, for the engine would probably knock fiercely after a hairpin, instead of expanding into an ear-splitting hum; it might not knock with the automatic carburetter. I have not tested the combination on an Amulree as yet, but it would certainly knock its heart out on either side of Amulree with the standard carburetter. After another thousand miles I would guarantee to climb either side of Amulree with a red hot engine and the standard carburetter on a gear of 8.75, whereas now I should fail with a gear of 10.3.

Looking down Buttermere Hause from the upper 1 in 4½ bend. This will prove one of the most trying hills during the A.C.U. Six Days' Trials, August 18th to 23rd.

By George D. Abraham, author of "The Complete Mountaineer," "Mountain Adventures at Home and Abroad," etc., etc.

ACCORDING to the immortal bard,

"Hills draw like heaven and stronger sometimes . . .
To pull you from the vile flats up to them."

But so far as motor cyclists are concerned the pull is prone to be in the opposite direction. In other words, during the forthcoming trials in the Lake Country it is the hills that will count, and the rider who most realises this fact is the one who will "come out on top" in more ways than one.

If variety is charming surely never such a beautiful array of hills has been brought before the glutton in gradients. For the Trials "freaks" have been altogether eliminated. Surfaces are, as a rule, remarkably good, and nothing of the "Hard Knotty" nature remains: even Blea Tarn Hill has been excluded, Honister is left alone, and no competitor will pull a wry face because Wrynose is "not in it."

Still there will be long hills and short hills, hills straight and hills curly enough to demand not only every scrap of power from standard machines, but also every iota of skill on the part of the riders and drivers. The writer's strongest impression during the hill-hunting expeditions has been what a splendid opportunity these six days' trials will afford the makers to keep up with the modern trend of motoring. We have all tasted of the speed craze, but this stage of motor enthusiasm palls, and the powers that be assist far too frequently and expensively in the disillusionment.

The Charm of Hill Hunting.

Nowadays there is a greatly growing tendency to explore and appreciate the byways and beauties of our land. The mountain regions of Lakeland, as well as Wales and the Highlands, afford an almost inexhaustible source of enjoyment for the explorer on whom the dusty delights of the trunk roads pall. For such there is comfort in the knowledge that the mount of his choice can go anywhere. The Six Days' Trials in Lakeland next August will show exactly the machines that can do this.

Another recent hill-climbing expedition has confirmed the writer's opinion that the most difficult problems for the Trials will be found amongst the hills of Southern Lakeland. Coniston was to be the meeting place, and again the motor cycling enthusiasts added to their reputation as late-comers. In fact, the special Carlisle contingent failed altogether to materialise. However, the time of waiting was not wasted, for the notorious hill above Coniston railway station was yet virgin ground so far as motor cyclists are concerned, and its conquest followed in due course.

New Hills for the Six Days' Trials.—

Mr. T. W. Loughborough, the secretary of the A.C.U., was with us. He had come up to choose the hills and routes for the Trials, and the plan was to show him something spicy in the way of gradients. The Station Hill, with its rugged and lofty rise up to the breast of Coniston Old Man, proved too severe and rough in his opinion, and will scarcely be included in the Trials' list.

The First Ascent of a New Hill.

As usual, Little, who came from the West Coast, was late, and to Harrison on his Swift fell the honour of making the first ascent of the notorious hill. He found it possible to strike straight up across the corners on the lower turns over gradients of 1 in 3½ and 1 in 3¼, and on the upper part some opportune advice enabled him to dodge a deep wrinkle in the roadway which upset some of his followers. To us on the heights there came up from the foliage-screened hollow much noise and roar of engines. G. W. Braithwaite, on his single-geared Rudge, was struggling valiantly but ineffectually with gravitation and a refractory belt. Finally, Hutchinson on his Zenith shot upwards out of the wooded shade on the rough open of the mountain side. Unfortunately, the watercourse diverted his flight. It was a stirring experience, especially for the rider. The machine developed aerial tendencies and came to earth on the mountain side, but no harm was done. In the end, Little, on his Premier, was the only other climber to surmount the hill, which, later on, will doubtless afford some record-breaking enthusiast an approach to the upper heights on the top of Coniston Old Man itself.

However, on the present occasion, Mr. Loughborough was anxious to see some of the new trial hills in the neighbourhood. Unluckily for all concerned he was mounted on a comfortable and speedy car. Suggestions to visit first a new hill noticed by the writer, but described by a Coniston authority as all "bog at t'bottom," were not received with enthusiasm. As usual, native knowledge was utterly wrong, and quite unaware of the new portion of road at the foot of Yew Tree Hill. Later in the day our party, much thinned in numbers, found it to be almost the most fascinating hill that will be included in the Trials.

The Secretary Lost.

But at the outset we followed Mr. Loughborough to Hawkshead over High Cross, though incidentally one enthusiast managed to make the divergence by Yew Tree Hill. After a considerable wait at the quaint little village where Wordsworth went to school this wanderer arrived short of breath, but full of talk about a "gem of a hairpin bend."

Meanwhile plans had been made to explore the hill which leads from Hawkshead over into Grizedale, and the secretary departed on his car with instructions to wait for the "small fry" on the top of the hill. Alas! the ways of hill hunters are hard to understand

A group of hill hunters on the top of Yew Tree Hill, Coniston. Left to right: H. Hutchinson (Zenith), G. W. Braithwaite (Rudge), W. B. Little (Premier), J. Randall (Sunbeam), and H. Harrison (Swift).

New Hills for the Six Days' Trials.—

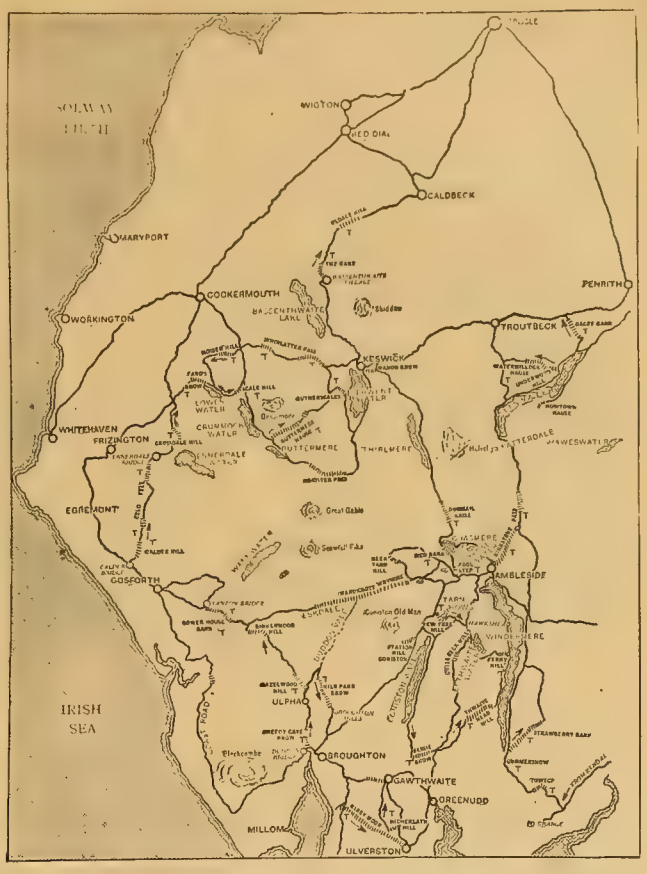
and follow. Sad to say, we never saw him again that day. But, mounted on his two-speed Douglas, he followed our route on a later day. Besides other things, he learned on that occasion that providence takes special care of motor cyclists who are pitched head over heels down a mountain side. Many a mountaineer has found a rock in his way on a smaller fall: an experience which is prone to preclude all further interest in old age pensions.

However, reverting to our last hill hunt, it may be mentioned that the main party turned to the right at Oxen Park in Grizedale. Thence we crossed over into the Crake Valley below Coniston Lake by Oxen Hill, to descend finally near Lowick Bridge by a delightful hill known locally as Bessie Brow.

Seven Corners in Half a Mile.

During the trials this hill will be taken in the opposite direction, thus during our first visit it had to be ascended also, and the woodland echoes were soon stirred with the music of well-tuned engines. The whole incline was nearly half a mile in length, and possessed of seven engrossing turns. The middle one had gradients of 1 in 3½ and 1 in 3¾. The other corners were mostly 1 in 4½ and 1 in 5, but all were sharp and awkward of approach, though the surface was perfect. Most of the machines climbed Bessie Brow splendidly. The Zenith was fast, and a 2¾ h.p. Sunbeam (three-speed) ridden by an Ulverston expert came up smoothly and sweetly.

Even in this lonely spot a crowd gathered quickly to watch the first motor cycles go up Bessie Brow. One keen dalesman, from whom enquiries had been made, followed us on foot from Grizedale, three miles away. Little made a specially thrilling ascent for the



Showing the positions of the various noted hills referred to in the accompanying letterpress.

Topping the rise on Tarn Hows Hill at Coniston. Some of the finest views in the Trials will be afforded to the competitors from this point. Coniston Lake is seen in the background.

edification of the late comers. There was somewhat of a stampede when he dashed round the half-way bend only to miss a descending machine and the spectators by inches.

Beautiful Coniston.

Then we turned northwards along the shore of Coniston Lake. For miles the road, beautifully foliage-fringed, wound close by the water's edge with wonderful views in front of the Old Man, gathering in grandeur at every turn. The view from near Ruskin's home at Brantwood was one which many a "Trials" rider must surely appreciate, for there are few fairer in all Britain. At Waterhead we hurried into the mountain gateway of Yewdale, and a mile and a half from Coniston village a sharp upward turn to the right marked the beginning of Yew Tree Hill. Still farther on, only a few yards away, was the old waterlogged approach to the hill, and as on the day of the Trials, the climb will be approached from Ambleside, some care will be required to take the right road. This will be the second of the two turns.

Some of us, three motor cyclists and a car, tackled the climb at once. We soon had a sample of the gradient, for before reaching the gateway that led up to the mountain side there was a twenty yard stretch of 1 in 3¾. Then through the gate there came a long, steep rise for about two hundred yards of 1 in 4½ and 1 in 4¾. The surface was not as smooth as a main road, but yet quite free from any slippery tendency. However, the riders of the Sunbeam and

Climbing the mountain road up to Kirby Moor—an excellently surfaced gradient of 1 in 4½, fully 2½ miles in length. This new route will be followed in the trials.

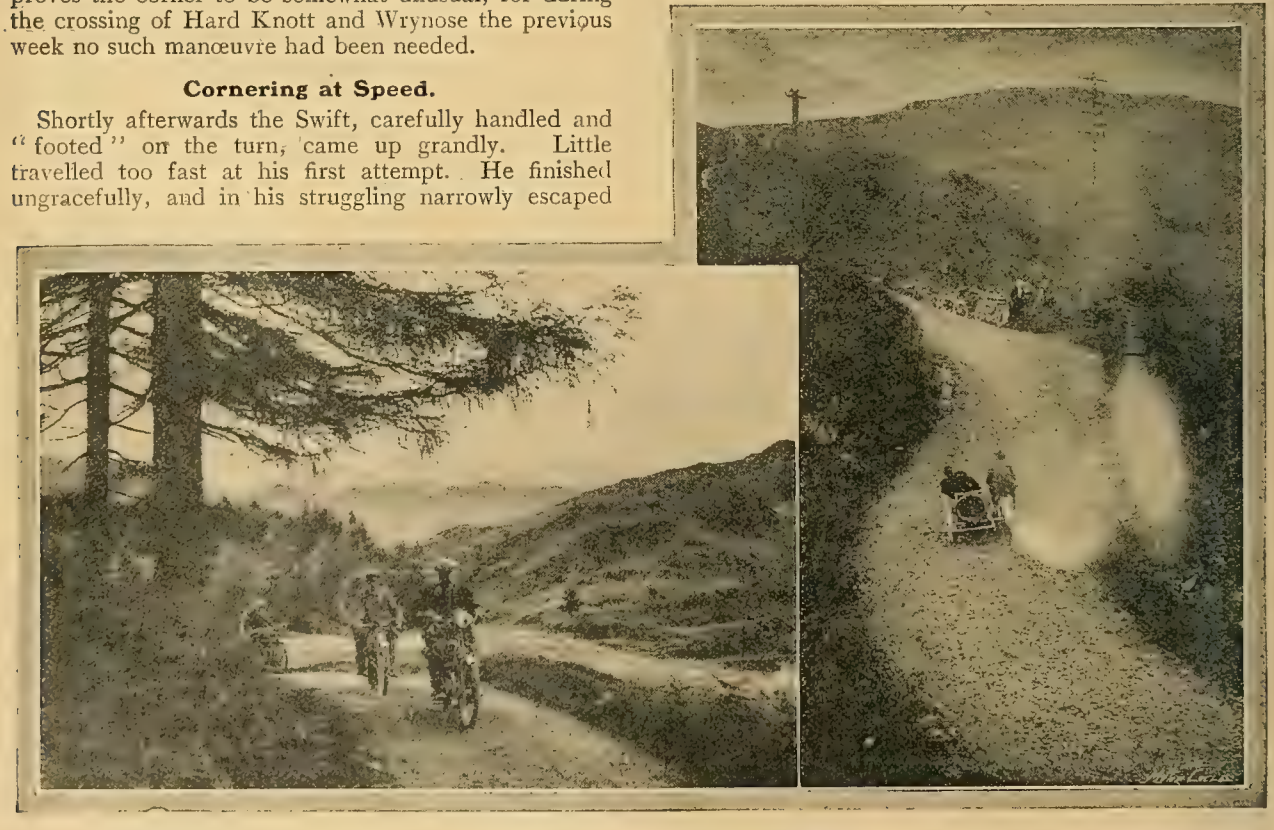
the Rudge soon had an opportunity of reconsidering a restart by the gateway, while the little 10 h.p. car sped merrily up past them to the "hairpin." This proves the corner to be somewhat unusual, for during the crossing of Hard Knott and Wrynose the previous week no such manœuvre had been needed.

Cornering at Speed.

Shortly afterwards the Swift, carefully handled and "footed" on the turn, came up grandly. Little travelled too fast at his first attempt. He finished ungracefully, and in his struggling narrowly escaped the rocky right hand bank. The Zenith failed to miss contact here, and despite our persuasion to try again finally "retired hurt," but only to the extent of a bent footrest. The Sunbeam and the Rudge arrived as much by man-power as horse-power. There was general regret that G. W. Braithwaite was not riding his own machine, for this kind of work is his special forte, and we should have been treated with a fine exhibition of skilful cornering.

Then Little showed us how to take the "hairpin" to perfection, and still later, at high speed again, missed the turn and saved himself by a straight dash up the bracken-covered mountain side. A few yards higher the ferny covering hid a ditch, and in this rider and machine disappeared suddenly. The Premier has had many hard knocks of late, and it seemed no worse for this last proof of its hardihood.

After measuring the gradient on this remarkable "hairpin" bend —1 in 3¾—we turned upwards from Yew Tree Hill and mounted over some continuous 1 in 5 to the larchy heights of Tarn Hows. There was steady climbing for fully a quarter of a



Through the pine woods by Tarn Hows, Coniston—one of the prettiest parts of the 1913 Six Days' Trials route.

Negotiating the sixth corner on Towtop. This is undoubtedly the roughest hill to be included in the Trials.

New Hills for the Six Days' Trials.—

mile until this famous Lakeland beauty spot, with its heather-encircled sheet of water, lay below. Then, when some smaller hills in the vicinity of Hawkshead had been inspected, we all turned homewards with memories of another glorious day on the heights.

The Question of Speed Trials.

Turning to topographical details regarding the forthcoming Trials, it may be mentioned that very probably the real test day will be that on which the speed events are to be run. They are likely to be held at Lowther Park, Lord Lonsdale's estate near Penrith. A suitable road for this purpose has been difficult to discover. The private way to Eskdale, through Muncaster Park, was considered, but it was not straight enough. After the Lowther speed tests the way will most probably lie over Shap to Kendal, and a local hill, probably Brigsteer, will be ascended.

Thence the serious day's work begins with Towtop, followed by Gummershow, which will be reached by the village of Higher Newton. Gummershow—not as so often misspelt Gunnershow—is at present in an unpleasantly rough state. Though the work will be finished before the Trials begin, timber felling is now in progress, and the heavy loads are taken down to Lakeside on Windermere, or to Winster.

Climbing Station Hill, Coniston. This hill has gradients of 1 in 3½, and leads up to Coniston Old Hill. It will not be included in the trials owing to the rough surface. Mr. T. W. Loughborough may be seen standing nearest the lowest motor cyclist.

Then, after lunch, a special hill-round may be made. Foolstep, near Skelwith Bridge, will very likely be negotiated before taking the way over Oxenfell to reach Yew Tree Hill in Yewdale, near Coniston. Those who extricate themselves from the "hairpin" will proceed happily up over Tarn Hows summit, and soon, turning to the right, proceed down the left or east shore of Coniston Water to visit Bessie Brow. Over the crest of the Brow there are several trying "steps" ere Grizedale Valley is crossed, and Rusland Vale entered near Thwaite Head. From this latter village there is an interesting hill, curly and as steep as 1 in 4½, which was missed on our final hill-hunting day, but later on visited by Mr. Loughborough.

From the top of Thwaite Head Hill the road drops steeply to the west shore of Windermere. An interesting return may be made to Ambleside by following the road which keeps most closely by the shore line almost as far as the Ferry Hotel. On the way there are two awkward downward dipping corners to negotiate before the long climb of the Ferry Hill on the main road begins. Beyond this, and through the village of Hawkshead, it is simply an ordinary undulating Lake Country road to Ambleside. The backward journey to Carlisle will probably be made over Kirkstone Pass, taking Dacre Bank, or Underwood Hill to Watermillock Hause, on the way. Such will doubtless be a typical day during the Trials.

No Secret Hills.

There was an idea, amongst local enthusiasts at least, of including some secret hills in the routes, but this has not been approved officially. The two important gradients suggested for this purpose were the Higher Lath Hill above Ulverston and Crossdale Hill near Ennerdale. The former leads up past Newbiggin Farm to the tarn of Knott Hollow on Osmotherly Moor. Past the tarn the Gawthwaite Road may be reached through Hawkswell.

The features of Crossdale Hill are its four interesting bends with gradients of 1 in 4 and 1 in 4½. This climb will be most conveniently visited on the northward way after crossing Cold Fell. The approach lies through Ennerdale Bridge, and after avoiding the right-hand turn to Anglers' Inn, Crossdale village is reached two miles further on. A sharp turn to the left just before reaching the houses gives the approach to the hill, from the crest of which Lamplugh is gained after passing Knockmurton Mines.

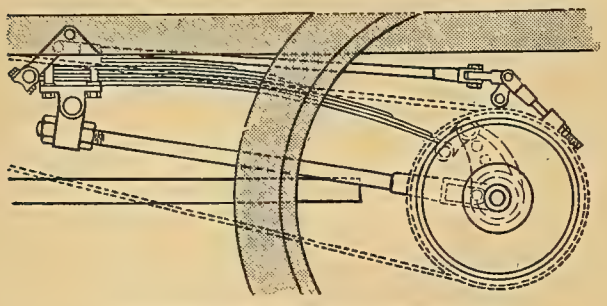
In one of the circuits in the northerly district a new hill-round which leads from Lorton to Mosser will doubtless be included, and the short but steep rise to Scale Hill Hotel would be ascended during the return to Keswick by Buttermere Hause and Gutherscales Hill on the west margin of Derwentwater.

On the whole, the Trials riders, many of whom come from abroad, and their followers will travel through the most beautiful scenery that our country can show, and, what with grandeur and gradients, the Six Days' Trials in Lakeland will undoubtedly garner memories and pleasant recollections which must last a lifetime.

The Springing of Cycle Cars.

THE RANGER.

A CYCLE CAR, the springing of which might have been dealt with among the other descriptions, is the Ranger. In this case, as shown in the accompanying drawings, grasshopper springs are used fore and aft, and in each case are supplemented by radius rods. The rod which takes the drive in the back axle is arranged so as to be adjustable at its front end, so that the tension of the driving can be adjusted,

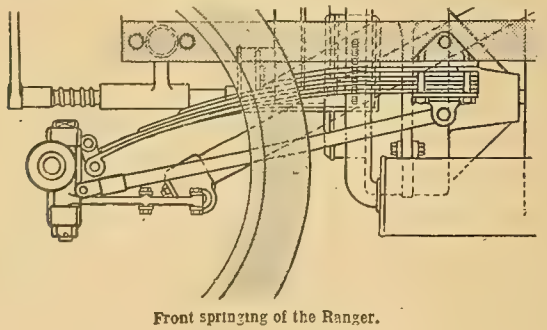


Quarter elliptic springs at rear end of Ranger chassis.

whilst the use of a shackle at the end of the spring allows the adjustment to be carried out without affecting the spring in any way.

I much regret that in my article in the issue of *The Motor Cycle* for June 26th, I should have made statements which have brought corrections from Messrs. Morgan and Co., and from G.W.K., Ltd.

With regard to the Morgan springing, all I can say is that at the Olympia Show, at which the notes for this article were principally taken, the attendant on the Morgan stand, in reply to my questions as to the additional subsidiary springs, told me that the nuts below the springs were screwed up so tight as to prevent all but the very slightest amount of give, and that, to all intents and purposes, the spring platforms were rigid. I find I made a note about this point at the time in my sketch book, and I further satisfied myself by putting all my weight on the back of the chassis and finding that the subsidiary springs were unaffected. It looks to me as though the particular chassis which I inspected had had the springs wrongly set up, and it is obvious that I was misinformed by the stand attendant. In any case, I tender my apologies to Messrs. Morgan. Much the same remarks apply to the G.W.K. description. This was taken from their polished chassis at Olympia, and if they have altered their design since then it is merely my misfortune not to have got wind of it. W. G. ASTON.



Front springing of the Ranger.

A CORRECTION.

The following are the letters to which I refer.

The G.W.K.

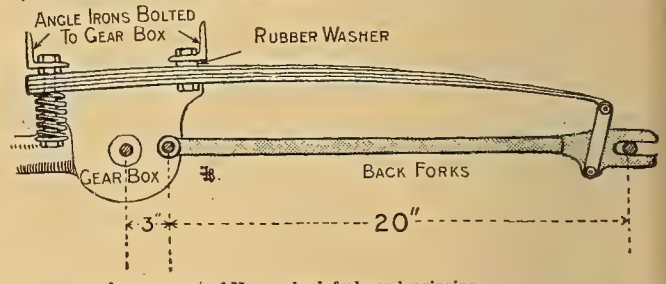
Sir,—In Mr. Aston's article dealing with cycle car springs reference is made to our car, and we regret to have to point out that this description is wrong. If the springs were made sufficiently stiff to take the torque strains, as your correspondent says they do, the springing would be much too harsh to be comfortable. As a matter of fact, torque rods are provided on our cars to take this strain.

These torque rods hang on a swinging link in line with the front universal joint. The springs are not anchored directly over the centre of the axle, as your illustration depicts, but are anchored behind the centre of the back axle so that two or more leaves can be brought over the centre of the axle, allowing a much more flexible spring to be used than would be the case if they were fixed as in your illustration. This probably is taken from one of our early cars in which they were so fixed, but this was found to be unsatisfactory.

For G.W.K., LTD.,
J. T. Wood, Director.

The Morgan Runabout.

Sir,—The writer of the article on the springing of cycle cars is misinformed in regard to the springing of the Morgan, and he is evidently without first hand knowledge of our car. He compares the springing unfavourably with that of the Autotrix. As a matter of fact, the principle is precisely the same. The centre of the radius forks is in a direct line between the counter-shaft and the back wheel (and not below it as in his description and sketch), and only 3in. behind the counter-shaft. Therefore, there is no strain whatever on the chains.



Arrangement of Morgan back forks and springing

Another important point of the springing he has not noticed at all, viz., the strong spiral spring which comes into action under severe shock. We have fitted this ever since the Show, but possibly the writer's information is taken from an early 1912 model.

We enclose a sketch which makes our meaning clear, and can be compared with the sketch in the article referred to.

THE MORGAN CO., LTD.

COMPLIMENTARY DINNER TO "TIM" WOOD.

The members of the Bradford Motor Cycle Club have given a dinner to "Tim" Wood and Mr. A. A. Scott, the designer of the winning machine. The chair was taken by Mr. S. Johnson, the president of the club. The Trophy was placed on the centre table draped with the Scott colours, *i.e.*, dark purple. Wood, in a suitable speech, responded to the hearty toast proposed by Mr Felix Scriven. Mr. Bullus, in proposing the health of Mr. Scott, recalled how, a good many years ago, he had been present at a certain hill-climb held by the Bradford Club. He was competing on what was then supposed to be a very powerful twin, but being no feather weight, had several attempts at the hill, and always conked out at the same spot. Presently, to his great astonishment, a light-looking machine with a most peculiar hum came steadily up the gradient with no signs of conking, and, furthermore, this machine had a passenger seated on the carrier—a very rare sight in those days. The rider was no other than Mr. Scott, who was testing one of the first Scott machines made.

OCCASIONAL COMMENTS
by "IXION"

My Annual Toss.

Like many motor cycling journalists I reckon to have at least one good toss per annum. It generally comes during one's work on the big reliability trials. If you have to watch 100 riders climb a test hill, and then overhaul the field again before the afternoon test hill, you have to keep up a high average speed over roads which are generally dangerous and often unknown. One or two skids or mistakes at blind corners are probable in a season's work. However, my first good tumble this year was unconnected with my work. I was "scrapping" merrily along at 45 m.p.h. as a private individual when a bolting horse, frightened by a steam mowing machine, compelled a lightning brake stoppage, and a loose road, producing a dry skid of the lurid order, completed my discomfiture. I picked myself up ruefully, and thanked the providence which watches over us mad motor cyclists for reserving the 'ard 'igh road for my machine, and depositing me gently on some softish turf. The peculiar thing about my small injuries was that my Burberry overalls emerged scathless, but my tweeds and underclothing were almost as badly cut as my cuticle. My right boot was minus any heel, and my lamp and footrests were in a parlous condition. Now I may point some morals, as follows:

1. When you perceive that a tumble is inevitable, tuck your head into your stomach, let yourself curl up into a ball, and *roll*. To stiffen yourself and throw out your arms is to ask for concussion and fractures.

2. The lamp always comes off worst in a tumble; and three-guinea acetylene outfits should be eschewed by the speed merchant. I do not know whether some genius can invent a lamp mounting which shall be tumble-proof. The lamp, of course, has to be set in a vulnerable position, but a spring swivel under its bracket might conceivably ease the blows it must receive.

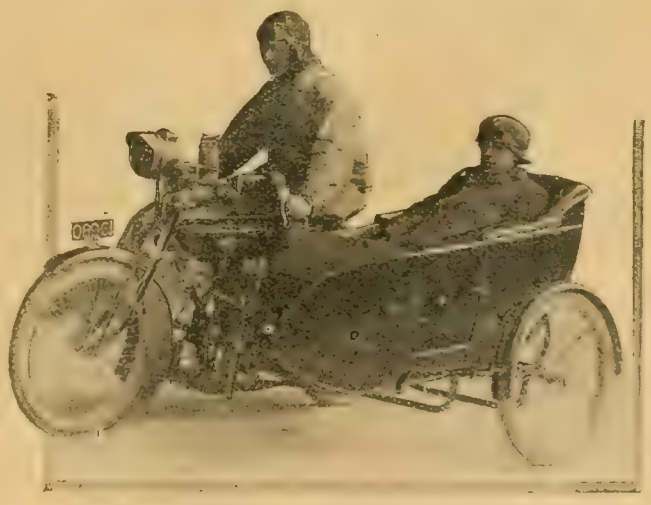
3. The footrests—well, what I have to say on this subject is sufficiently lengthy to deserve a separate paragraph.

Footrests and Falls.

Take the two machines in my garage as examples. One has its front footrests mounted on a $\frac{5}{16}$in. steel rod, which also acts as a frame bolt. This rod is supported by the frame for its central 3in., and projects for 5in. on each side to carry rubber footpads. The whole affair is a dead tight driving fit—nuts, washers, hollow footrest spindles, frame-holes, aluminium packing tubes, etc., etc.—there is no clearance anywhere. The consequence is that quite a small blow on the steel spindle upsets the whole contraption. If removed, it cannot be replaced—one kink is fatal; and the steel spindle is too stiff to be straightened unless it is heated red-hot, and very carefully hammered out on a surface plate, after which the screw threads at each end must be re-tapped—an atrocious piece of detail design. My other machine is theoretically superior. Its footrests are carried on L-shaped steel pieces, adjustable for angle by toothed ratchets. The central mounting which carries them is unaffected by falls. You have merely to take off a nut, when the short L-shaped carrier drops into your hand, ready to be trued up. But even here there has been a blunder. The steel of the L-shaped part is far too good. It is difficult to get it straightened, even if you use a huge vice and a two-foot wrenching lever. Let such designers take a hint from the Ford cars. Many of the Ford parts—front axle, wing stays, steering connections, etc.—are made of a special vanadium steel, no more costly than the steel employed by the short-sighted British designers of whom I speak; and this vanadium steel can be twisted about *ad lib.* without heating, and does not crystallise under the process. If a similar steel were employed for these L-shaped footrest carriers, they could be trued up by a couple of kicks. But as it is, it is difficult to true them, even if a fully equipped workshop is available.

Flexibility.

Our leaderette of June 19th was undoubtedly correct in emphasising the need of automatic carburetters if the average motor bicycle is to equal the flexibility



UNOFFICIAL SIX DAYS' SIDECAR RECORD.

W. J. Clarke (3½ h.p. Monarch and Compeer sidecar) who, as we mentioned in our last issue, is credited with covering 1,800 miles in six days. His daily distances were as follows:

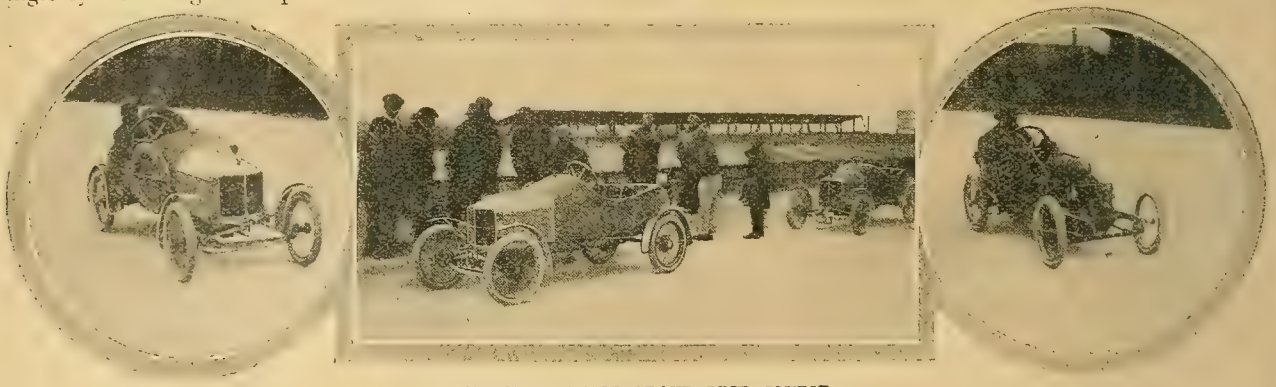
Monday	378 miles	in 22½	hours.
Tuesday	268 ,,	,, 18½	,,
Wednesday	332 ,,	,, 20	,,
Thursday	268 ,,	,, 19	,,
Friday	283 ,,	,, 19½	,,
Saturday	271 ,,	,, 19	,,
	1,800 miles	118½	hours.

Occasional Comments.—

of such cars as can travel at any speed from 4 to 50 m.p.h. on top gear ratio. I can only recall a single formal flexibility test of motor bicycles in which Frank Hulbert bettered the above figures on quite an early model Triumph. But such performances are only possible when an expert is handling a specially tuned machine. The ordinary 3½ h.p., as delivered to the general public, can seldom show better figures than, say, 10-45 m.p.h. on one gear. Our leader writer laid the main emphasis on carburation, and he is so far right that few men can handle the air control of a two-lever carburetter with sufficient delicacy to secure the potential maximum of flexibility; its position may vary with the temperature, the gradient, the specific gravity of the spirit, and the tune of the machine, whereas a first-class automatic carburetter may—and sometimes does—rise superior to all these variable conditions. When I ride my pet 1913 machine, I never try to keep on top gear at less than 15 m.p.h. if my two-lever carburetter is attached; for the air lever is so tricky at speeds under 15 m.p.h. that it is simpler to drop to second gear than to be continuously tap twiddling on top gear; with an automatic carburetter I only change down when the speed drops to 10 m.p.h. or so, for the automaticity is perfect between 15 and 10 m.p.h. I think our leader writer should have drawn attention to the fact that no single-cylinder car shows a flexibility range of 4-50 m.p.h.; indeed, I do not suppose that any twin-cylinder car has touched these figures. Flexibility is, of course, a much simpler ideal to attain with a four-cylinder engine. The impulses almost overlap, and no matter how feeble they are, they keep the flywheel on the move, and maintain carburation; whereas with the single-cylinder engine at present characteristic of the motor bicycle, a weak impulse is followed by a long wait for a second weak impulse, and there is hardly sufficient suction to vaporise a tiny puff of explosive mixture. There is a further point—how far are excessively slow speeds desirable on a motor bicycle? I find steerage balance difficult when the speed drops below 10 m.p.h. on a two-wheeler, and I question how far the lower end of a 4-50 m.p.h. range is worth having. I should say that a 10-50 m.p.h. range supplies all that is really desirable, especially when a second gear is available for brief traffic emergencies.

The Right Side for Speedometers.

It seems to me that there are two good reasons why the ideal side for the speedometer is the near side. Most men use their left hand for single-handed steering, and operate their hooters with the right hand. The right-hand side of the handle-bar is already normally encumbered with the front brake lever, two carburetter levers, and a hooter, whereas the left-hand side of the handle-bar often carries nothing but the valve lifter, and occasionally a magneto lever as well. In other words, there is much more room for the speedometer dial on the *left-hand* side of the bar. Furthermore, if all the accessories are mounted on the right-hand side, as is customary, the balance of the machine is upset. I could ride both my 1913 machines "hands-off," as delivered, at any speed from 15-45 m.p.h. on a decent road, and the trick is handy when gloves have to be adjusted, or a wind vesta applied to the bowl of one's pipe; but since the accessories were bolted in their fore-ordained places, the machines have lost this easy balance, and "hands-off" riding has become very tricky work, even on the best of surfaces. Why should not the left-hand side of the bar be recognised as the standard place for the speedometer dial?



CYCLE CARS ON THE GRAND PRIX COURSE.

(1) The Ronteix in full flight. (2) Two Ronteix cycle cars after a spin round the course. (3) A Sphinx travelling well.

WEAR OF BIG END BEARINGS.

An article under the above heading, signed "A.M.I.C.E." touches on a most important point. It will be generally admitted that the most unsatisfactory part of the modern motor cycle is the big end bearing. "A.M.I.C.E." states that few 85 mm. cylinders have big ends of more than 1in. × 1¼in.—few indeed, the majority are smaller than this, and twins are usually worst offenders. Bearings of this size *must* have proper lubrication if they are to give reasonable service, and this is just exactly what they do not get. With the present design it is marvellous that the big ends last as long as they do, for the flywheels throw the oil directly away from the bearing, while the overhanging rims protect it from any oil which might otherwise drip on it. There seems to be a general impression that the big end dips in oil every revolution, but this cannot be, as the flywheels throw the oil round the crank case. It is, however, just possible that a ring of oil is whirled round between the rims, and that this is occasionally deep enough to reach the crank pin. Positive oil feed to the bearings is a most crying need.

UBIQUE.

GRAND PRIX OF FRANCE.

Distance: 360 Kilometres.

RUN ON 22nd JUNE,

—WON—

by W. DAVIS, riding a

Douglas

2¾ h.p. Motor Cycle with Sidecar.

Averaging 25 miles per hour.

Translation from the journal "L'AUTO," 23rd June, 1913.

"While I am writing about the lightweights, I would like to point out the grand performance of the DOUGLAS only 350 c.c.; it drew the Sidecar with marvellous regularity, and averaged 25 miles per hour for 225 miles. Davis, the driver, and the passenger weighed over 23 stone; I need add nothing to this, figures speak for themselves."

Translation from the journal "L'AERO," 23rd June, 1913.

"Davis, on his DOUGLAS 2¾ and Sidecar, did one of the best performances of the day."

Although the "DOUGLAS" is not recommended or sold for sidecar work, the above performance proves the wonderful power and reliability of the machine.

DOUGLAS BROS., Kingswood, BRISTOL.

LONDON—336, Goswell Road, E.C. **PARIS—190 Boulevard Pereire.**

An Echo of the T.T. Races:

"I think the fact that I did not have the slightest trace of tyre trouble speaks volumes for your tyres in view of the great speed attained."

So writes O. C. Godfrey of the

Continental

T.T. Pattern Tyres

he used.

We give a further extract from his letter:

"P.S.—It may interest you to know that I took my machine over for the French motor-cycle Grand Prix Race at Fontainebleau on Sunday last **fitted with exactly the same tyres** as those supplied for the T.T. Race.

I may say that I gained leading position very shortly after the start of the race and held the lead up until I had covered 260 miles, when I was then leading by 6½ minutes."

Compare this with the experience of riders who used other makes.

Brough shouted that he had punctured in every lap.

W. Heaton lost his chance of success by puncturing three times in his last lap

H. Greaves punctured and had to blow up his tyre repeatedly.

Edmond retired on the second lap, when lying well up, had tyre trouble.

"Duggie" Brown's tyre came off, tape and all at Sulby Bridge.

J. L. E. Emerson also retired owing to tyre troubles.

LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Slowing Down the T.T.—A Suggestion.

Sir,—As a suggestion for reducing the speed in future T.T. Races, I throw out the following idea for Dr. Low or some other brilliant inventor to work out, that a wheel or fan be made, fixed to and driven by the engine, with the spokes of fan made flat and of a size large enough to offer a resistance of about 2 h.p. or so, thus keeping the speed down to the necessary limit. Some such idea as is used by some makers for a bench test would do. CT. 806.

Drip Feed Lubricators.

Sir,—With reference to the drip feed lubricators fitted to Messrs. Jacobs and Le Grand's Singers illustrated in your issue of June 26th, I may say that these were fitted in accordance with my advice to the gentlemen interested, and the lubricators are of our standard pattern, and that we carried out the attachment. It is interesting to note that simply flooding the engines with oil has improved their pace. If you would mention these facts on the "*palmam, qui meruit, ferat*" principle it will be esteemed a favour by

A. C. DAVISON.

Puncture Stops.

Sir,—I have lately had occasion to make a chemical examination of several so-called "puncture stops" which have been from time to time put on the market, and have been very much struck with the diversity of character of the various substances put forward.

One—a German compound—appeared to be a mixture of molasses and bran, while another was a milky fluid said to be the juice of an African plant and closely resembled the latex of a rubber tree. Most of them were of a sticky nature and gave a tenacious film on drying; but the one that has puzzled me most, and for which the makers have recently been claiming great things, appears to be a simple suspension of chalk in water. I should like to hear in what way such a mixture would be likely to act in order to be of use in stopping a puncture. Perhaps someone can enlighten me on this point. PERCIVAL J. LYCETT.

Spring Footboards and Twin Lamps.

Sir,—I think it would be of interest to the many thousand Triumph riders if you will allow me to add a few lines of explanation to the excellent picture you published recently of my 1913 Triumph. The spring footboards can be fitted without alteration to the 1913 Triumph, and are adjustable in every direction without interfering in the least with the pedal gear, the advantages of which are thus preserved. I think it would be impossible to exaggerate the comfort they confer on the rider.

The twin lamps also supply what many hundreds besides myself have felt to be a real want, and enable me to keep up my daylight average at night. They are small car lamps with 5in. Mangins and 17 litre burners; they are attached by a special bracket, consisting of two arms of solid steel, the two lamps being locked together in the middle. They are exceedingly satisfactory in use, and at forty miles show less vibration than most single lamps at twenty miles. The lamps and footboards were fitted to my design, and are not expensive. (REV.) JOHN E. FITCHER.

Ultra-lightweight Motor Cycles.

Sir,—I was much interested in "A.W.D.'s" letter in your issue for June 19th. I must say "A.W.D." has opened up a subject of the utmost interest. The cost, for instance, of a ½ h.p. twin-cylinder horizontally opposed engine after the style of that fitted to Douglas motor cycles, complete with all necessary attachments, built, of course, on the simplest lines, could, I am sure, be brought far below that of the present lightweight machines. Problems such as the most suitable form of transmission, speed gear (if any), etc., would, of course, require some thought, but should not present any great difficulty. Such a machine should maintain at least a speed, say, of 14 to 15 m.p.h. on ordinary give and take roads, and take any fairly sharp rise with assistance by pedalling.

It would be interesting and most helpful to hear the opinion of motor cycle manufacturers in this really important matter. H. DIXON.

NEW HILL FOR THE SIX DAYS' TRIALS.

Underwood Hill—leading to Watermillock Hawes. This gradient of 1 in 4 will be included in the trials on the road between Carlisle and over Kirkstone Pass to Ambleside. It is one of the severer hills, but except in one place the surface is good.

Substitutes for Petrol.

Sir,—Whatever may be said of fuel mixtures, I notice very little remark upon the mileages obtainable. Very few say what make of engine or carburetter they use. I have not, so far, ventured any experiments, but should be glad of riders' experiences with Douglas 1913 T.T. engine fitted with Amac carburetter. I recently came from Ballyhaunis to Armagh, a distance of 140 miles, averaging over 20 m.p.h. My tank holds one gallon and one pint, and I had a quart and half-pint left on reaching Armagh without any replenishment. This works out at 172.3 m.p.g. The petrol used was second-grade Shell.

The usual disclaimers apply. BI 117.

Sir,—As a motor cyclist, I should very much like to add my experience of benzole.

I have a 6 h.p. Royal Enfield motor and sidecar. My passenger and I weigh 22 stones. Recently I commenced a journey of 104 miles with eleven pints of benzole in my tank, and on completing the journey I had left two and a half pints. So 104 miles were travelled on eight and a half pints of benzole, which, I think, is very good. I may add that the journey was partly over the Yorkshire Wolds. I have been using benzole for about six months, and I find, on examining my cylinders and plugs, that they are extremely clean and free from any carbon deposit. As far as I remember my mileage was 75 m.p.g., so I consider there is a great saving in the new fuel. I trust that others will try benzole and give us their experience. T.J.G.

The Motor Cycle for Business Purposes.

Sir,—I was somewhat amused at "T.H.B.A.'s" estimate of cost of running a 5-6 h.p. machine and sidecar for 15,000 miles, particularly the gigantic sum of £7 7s. 4d. allotted for tyres during that period. If he multiplies these figures by three he will doubtless be somewhat nearer the mark.

My own brilliant record for tyres on a 4 h.p. single, no sidecar, for 5,000-6,000 miles is as follows: First cover, 2½in. heavy rubber-studded tyre, one of the best makes and marked "heavy." burst under 1,000 miles. This might have been bad luck if the cover had not pegged out entirely in three or four places in the next 500 miles. No satisfaction from the makers, and over £1 spent in useless vulcanising. The next cover was a bit cheaper and lighter, and lasted longer, but this one went at the bead long before it was worn out. I managed to obtain a very fair allowance from the manufacturers off cost of new one. My next was another extra heavy rubber-studded cover of different make. This lasted about 1,500 miles before going at the bead, long before the studs were worn out. I spent 10s. on repairs, and ran it on the front wheel for about 1,000 miles. Besides the above covers I bought two cheap covers, primarily for the front wheel, though I was compelled to use them on the back occasionally when the "heavy" covers gave out. I must say I obtained more value for money with these cheaper tyres. I even went to the trouble of obtaining the makers' own rim for one of the back covers I had. I am running now what looks to be a really good medium priced tyre on the back wheel, and after 1,300 miles it looks still good. I may be in luck at last.

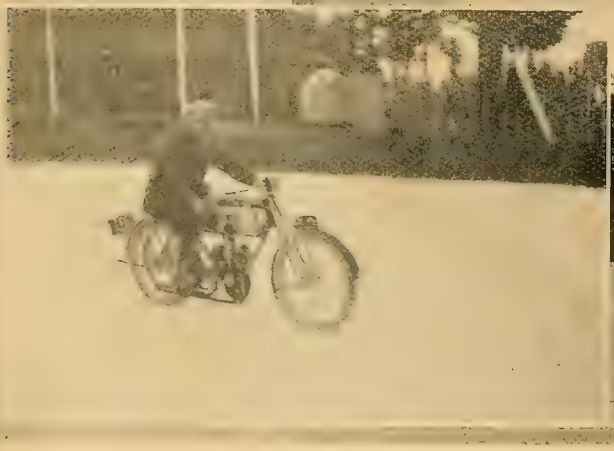
I find I am by no means alone as regards tyre trouble, my brother having used up seven or eight covers in about 11,000 miles. He runs heavy 2½in. covers on a light weight. Most of our covers give up the ghost long before being worn out. I have ridden motor cycles for seven years, and from my own and friends' experience have come to the conclusion that the medium weight tyre is better value for money than the heavier covers, many of the latter being too heavy for the strength of the walls and bead. Some of these should be marked "extra rotten," instead of "extra heavy."

C. E. TURNER.

Foreign Motor Cycle Tour.

Sir,—I and a friend are arranging a trip to the Continent this summer for the first two weeks in August. We propose going from Dover to Ostend, thence to Ghent (exhibition), on to Brussels, thence to Berlin *viâ* Dusseldorf and Frankfort, and back to Hamburg and Bremen, thence by water to Harwich. Would any fellow readers who have made such a trip be prepared to volunteer their experiences together with the best roads and hotels? Also would it be cheaper to make the trip by means of one motor cycle and sidecar or two motor cycles?

A. P. LONG.



PRACTISING FOR THE GRAND PRIX, TO BE HELD ON THE 13th INST.

(1 A group outside the Grand Stand in the early hours of the morning.
(2) Dubost (Rene Gillet), at speed past the replenishment depots. (3) One of the competitors on the banking near the Grand Stand.

GEARS—and the T.T. RACES

Remarkable vindication of the "HUB" Three Speed Gear.

IF any doubt were entertained regarding the absolute efficiency of the "HUB" Three-Speed Gear it should be conclusively dispelled by the great success of "The ARMSTRONG" 3-speed MOTOGEAR achieved in the JUNIOR and SENIOR T.T. RACES.

— The popularity of "The ARMSTRONG" amongst expert riders — its signal efficiency and absolute dependability under the most severe running conditions — abundant proof that this Three-Speed Hub Gear does not slow the machine — that it accomplishes that which two-speeds cannot — that it gives no trouble — is the simplest, most reliable and altogether best form of variable gear in the world — and that its selection as the supreme exponent of the Hub form of Three-Speed Gearing was well justified, is evidenced in the following facts:

(1.) THAT more than 40 competitors used ARMSTRONG Gears in the two events.

RESULT THAT the Junior T.T. Race was won by Mr. Hugh Mason on a machine fitted with the ARMSTRONG Gear.

(2.) THAT in the Junior Race, ARMSTRONG Gears were 1st, 6th, 8th, 12th and 15th.

PLACES THAT in the Senior Race, ARMSTRONG Gears were 8th, 9th, 11th, 12th and 23rd.

THAT in both the Senior and Junior events, 4 ARMSTRONG Gears finished in the first 12 home in each Race.

(3.) **GOLD MEDALS** THAT in addition to the Junior Tourist Trophy, 3 Gold Medals were awarded to the riders of ARMSTRONG Gears.

(4.) **SPEED** THAT the Fastest Lap ever accomplished in the Junior T.T. Race was this year done by the winner on an ARMSTRONG Gear. This is a most important point, because people who use Bracket Gears continually state that Hub Gears slow the machine. The above result proves the opposite.

(5.) THAT far more ARMSTRONG Gears were used in the races than any other make of gear. This must indicate that the ARMSTRONG Gear is considered by expert riders as being the best gear obtainable for this exceptionally severe strain.

(6.) THAT of machines fitted with other makes of 3-Speed hub gears, none finished in either Junior or Senior Race (see "THE MOTOR CYCLE," June 12th, pages 776-785).

(Although other gears are advertised as having "given no trouble," it is a noteworthy fact that NONE of these finished the race! It is particularly noteworthy here — and a fact to be well borne in mind — that 10 machines fitted with "The ARMSTRONG" MOTOGEAR finished the race!! — and in no instance was any other make of hub 3-Speed Gear successful!!)

(7.) THAT "THE MOTOR CYCLE," June 12th, page 777, states: "Mason, with his middle ratio, was able to elude Newsome at Creg Willy," whilst "on the mountain THREE-SPEEDERS scored more decisively still."
THAT "THE C.T.C. GAZETTE," July, page 278, states: "Mason's machine was driven by a special Twin J.A.P. motor through an ARMSTRONG 3-Speed Gear, the extra gear giving him some advantage over the 2-speeded Douglases."

This indicates the advantage of THREE-SPEED over TWO-SPEED GEARS

(8.) THAT throughout the race ARMSTRONG Gears gave every satisfaction, thus demonstrating the superiority of the Hub form of gearing, even in a punishing competition like the T.T.

THAT the result obtained proves very plainly that the Gear was more reliable than many other mechanical parts of the Motor Cycles, for on reading the Press reports it will be noticed that out of the many riders knocked out of the race through mechanical troubles, none were due to fault in the ARMSTRONG Gear.

(9.) THAT although so many ARMSTRONG Gears were used in this excessively severe test, in no case did an ARMSTRONG Gear prevent a rider from finishing.

These points considered, clearly demonstrate two vitally important facts:—
(a) THAT the 3-Speed Gear is the best form of gearing for Motor Bicycles invented up to date.
(b) THAT the ARMSTRONG is immeasurably superior to any rival form of 3-Speed Gear.

— Specify "The ARMSTRONG MOTOGEAR" — the proved BEST Three-speed Gear!

The ARMSTRONG 3-SPEED GEAR Co., Ltd., BIRMINGHAM.

In answering this advertisement it is desirable to mention "The Motor Cycle."

Climbing Branscombe Hill.

Sir,—With reference to the paragraph on page 877 of your issue of July 3rd, which would seem to give Mr. Carson credit for being the first to climb Vicarage Hill, Branscombe. No date is given, so perhaps Mr. Carson would be interested to know that I climbed the hill on August Bank Holiday, last year, with two passengers, on my 6 h.p. Royal Enfield and sidecar; the gears used were standard, about 8½ to 1 on low. H. MELLOR JAMESON.

Tyre Holes under Patches.

Sir,—As one who habitually rides his tyres to destruction, I should like to give you my opinion of repairing them. At one time I had much bitter experience with punctures and tried a great many different makes of repair outfits. I have now definitely decided to keep to one, viz., Patchquicks, which I swear by. The great point is to use a large enough patch and to affix it properly. After doing so it is extremely rare to have the slightest trouble with it again as long as the tyre lasts. I would venture to suggest that the experience of "Ixion's" friend is almost unique. Does he use tyres of inferior quality? And has he ever had a patch blow off? I have, and, in my opinion, it is one of the most trying things that could happen to a motor cyclist.
V.A.

Hill-climbing Formulæ.

Sir,—Dr. Low's formula described in your issue of July 3rd is most ingenious; but if it is correct the ordinary formula $\frac{W}{C \times T^2}$ is something worse than incorrect. The following is a rough comparison of the two fastest passenger machines and the two best on formula at South Harting on Dr. Low's formula and on the old formula:

Car		Dr. Low's formula	Old formula
Chota	2m. 29s. ...	209 ...	60
Cycar	4m. 4s. ...	78 ...	36
Morgan ...	1m. 43s. ...	46 ...	92
G.N.	1m. 50s. ...	32 ...	74

Surely there is something wrong somewhere?
H. GEORGE MORGAN.

Sir,—Referring to Dr. Low's letter in last week's issue, it is unfortunate that the results of the first public use of his formula appear in the same number, because one is tempted to investigate whether the "very just results" claimed are actually obtained in practice. The outstanding feature of the results on formula is the figure of merit attributed to the Chota, with a score of no less than 2.096; the second highest is .7836, and the third best is .4647, followed by a string of .3, .2, and .1's. Assuming the accuracy of the published figures, and taking account of the 1.75 index, it is clear that the Chota could have taken 70% longer and still have been first, or have taken 130% longer and come out second on formula. Again, to equal the Chota's figure of merit the speed of the fastest Morgan would have to be increased to 94 m.p.h. up the hill.

Turning to the theoretical aspect, if a competitor uses a small engine, of which the cubic capacity is equal to K (which is understood to be taken as 200 c.c. in this case), the denominator will contain zero as one factor, consequently the time taken may be anything less than infinite, and still this competitor must come out on top. Again, if the engine is smaller than this figure (K), the factor will become negative, with a result which is absurd in the mathematical sense. It would appear, therefore, that the use of the factor (C—K) is wrong both in practice and in theory.

In spite of Dr. Low's remarks about the greater divergence of weight in cycle cars than in motor cycles, he employs no other than the customary factor W; that is to say, the actual weight of machine and passengers.

The use of a variable index to the time factor is certainly a good point, because it is known that the T^2 formula does not suit all hills equally well. But could not the variation in this factor be adjusted automatically, so that the selection of an index would not be left to the judgment of overworked officials?

The best test of the fairness of a formula is to take the figures of merit of the first few competitors and to note the differences; if machines of varying type can be taken, the better the test. Applying this to the published results of the South Harting climb, Dr. Low's formula gives very widely separated figures, and to that extent also it is a disappointment. CYRIL J. FEENY, A.M.I.Mech.E.

[We publish our correspondent's letter as it is interesting, but we would point out that the official figures of the Cyclecar Club hill-climb are not correct, as will be seen by reference to page 905. Respecting the constant K, this is chosen with reference to the c.c. of the competing machines, so the case imagined by our correspondent could never arise.—Ed.

Tyres and Accessories in the T.T.

Sir,—Your correspondent "Interested" directly invites the views of tyre manufacturers upon his letter. His suggestion is that tyre firms compete in order to secure the use of their tyres by the likely winners of motor cycling events. He also submits that, if this is so, the public are being deceived and the winning tyre is not necessarily the best tyre, but the tyre that carries the biggest subsidy.

If I reply that your correspondent is very close to the truth, it is not necessarily in protest against the methods of advertising which other tyre makers prefer to adopt. They have their own business interests to look after, and have perfect liberty to spend their money in subsidies to riders or in any other legitimate way that appeals to them. I do not blame the riders who accept the subsidies. They have their living to get; and so long as they can command free tyres and a cash payment for making themselves running advertisements of particular goods, they cannot be blamed for their share in the transaction. After all they have to make reasonably sure that the commodity they are paid to use is a fair average commodity, because, if it were less than average, it would let them down.

At the same time, from the public point of view, there is an element of deception in the practice. For a very important event, special tyres might be prepared. If that make of tyre wins, the public who buy the stock tyres under the impression they are the same quality are deceived.

Again, a competition with an international interest like the T.T. is important enough as an advertisement for the winning tyres, for tyre firms to spend very large sums. The one with the largest resources might make a win for its tyres practically inevitable by covering the whole of the first-class riders.

Again, and most important of all, from the consumer's point of view, the firm whose resources were not equal to the subsidies demanded by the likeliest riders, or who objected to that method of advertisement, might have an infinitely better tyre than the winner used, a motor cycle tyre of far greater utility, durability, and economy, yet that fact would be obscured by the publicity given to the winner. That is a direct loss to the consumer.

Sooner or later the better tyre will win in the market on its merits—if the organisation behind it can hang on until success comes. If, however, it has no resources to hang on with, it must go under. The public are losers in the first case in the immediate sense, and losers in the second place all the time. The important point is that the winner of a big race may not be shod with the best tyre, but, on the contrary, shod with comparative shoddy. If that is not so, if there is so much virtue in the win, then the tyres which do not win, or meet with mishaps, like punctures or bursts, are much less virtuous. In that case the names should be made public, in the public interest, as tyres to avoid. If that were done, we should find that the virtuous winning make was also an unvirtuous losing make.

Certainly, I think the public should be made aware of the fact that subsidies are given to first-class riders—indeed subsidies are demanded. Also, I think it should be made clear that tyres which win races are not necessarily the best tyres for the utility work of the road. A tyre that collapses under the exceptional stresses of road racing might easily outlive by thousands of miles the ordinary road life of the winning tyre. The value of a win in such an event is, therefore, a very dubious quantity from the consumer's point of view, and, for the reasons given, likely to be very misleading. W. YARWORTH JONES,
Managing Director Victor Tyre Co., Ltd.

SPEED TRIALS AT COLWYN BAY.

Fastest Speed: 76¼ m.p.h. by J. J. Cookson (Matchless). Continued Singer Successes.

SPEED trials, reminiscent of the events held at Southport and Blackpool some years ago, were arranged by the Mersey (Liverpool) Motor Club at Colwyn Bay last Saturday. The Mersey Club is a comparatively new organisation, and consequently deserves much credit for the successful handling of such an important meeting. The club was rewarded with nearly 250 entries of cars and motor cycles, but it must be recorded that there was an extraordinary number of non-starters. About 5,000 people witnessed the tests, which were, however, only moderately interesting, for the sight of a solitary motor cyclist speeding along at about a mile a minute, and continued for about five hours, is not calculated to enthuse even the keenest sportsmen. To make matters worse, some of the competitors were entered in a number of classes and were seen many times, and, further, the timekeepers, for some unknown reason, withheld the times until 8 p.m., so that nobody really knew what was happening or who were likely winners.

Against Records.

The wind was blowing rather strongly in the faces of the competitors when at noon a commencement was made with the cars. Practising had been indulged in during the morning, and many interesting machines were exposed to public view, the eight-valve Indian with its direct chain drive to the rear wheel attracting the most attention, whilst there was quite a fleet of Matchless big twins. In the motor cycle classes, competitors were started in pairs, the times in the kilometre events being taken from a standing start, whilst in the half-mile sprints a good distance was allowed in which to get up speed. Occasionally spectators were treated to a duel, but runaway wins were the order.

G. E. Stanley was, as usual, in form with his Singers. He was always quick off the mark, his perfectly tuned engines responding with alacrity, and once under way few could hold him. It is some time since Stanley found his match on 2¾ h.p. or 3½ h.p., but Edmond, on a twin Humber, developed an astonishing turn of speed, and was able, for once in a way, to check Stanley's career by averaging exactly 60 m.p.h., and this with mudguards. It has come to be regarded as an achievement to beat Stanley at his own game, and the Humber exponent should be encouraged to further deeds. Charlie Collier, on his neat and prim T.T. Matchless, once or twice gave Stanley a close run, but Collier himself was once well beaten by J. H. Fox, an amateur rider of a Matchless-Jap. There were other lesser known men who exhibited great promise, including H. J. L. Greatwick, who used a twin Blumfield engine, Gilbert Hall (Scale-Jap), and F. C. Topham (Dot).

J. P. Nicholson (Zenith) and C. R. Collier (Matchless) on the starting line.

Another Singer rider who won several firsts and was always well up was J. Cocker, so with the success of their cycle car, which equalled the time of the famous 20 h.p. Vauxhall car, Singer and Co., Ltd., may be said to have had another field day.

The wind was the cause of a surprising number of stray hats about the course; it was quite a common sight to see competitors returning on foot for their headgear. Several wisely wore pneumatic racing helmets for safety. Stanley also had T.T. garb and even elastic bands around his riding breeches to cut down windage!

Few of the passenger machines in the racing class event were stripped, their owners preferring to enter them in the touring class also.

12 stone Rider of a Lightweight.

Busby was riding a strange mount to him, a Sunbeam, but did splendidly, despite his twelve stones weight. D. C. Bolton, on a very light Rudge with A.S.L. fittings,

Scene at the starting line showing Hugh Gibson (3½ h.p. Bradbury sidecar) who won two events. In the picture may be seen S. W. Carty (Secretary of the meeting), Mr. T. W. Loughborough (A.C.U. Secretary), and at the right Mr. A. G. Reynolds (timekeeper).

Speed Trials at Colwyn Bay.—

impressed one by his speed, and was, in fact, only bettered by the redoubtables—Stanley and Collier.

Edmond lost one event by gathering his carburetter control which had slipped round the bar and thereby closing the throttle, for Whitworth, whose Douglas was going remarkably well, beat him by ⅕s. Whitworth used a two-speed Douglas and was usually well ahead of his opponent in less than 100 yards.

The events of the day were Classes 8 and 14 for machines up to 1,000 c.c., the high speeds attained greatly pleasing the bored spectators. J. J. Cookson's success was well deserved, though Harry Reed pressed him to within ⅛s. It was some consolation to the latter that his Dot machines were successful in other classes. George's eight-valve Indian did not get away well at the start, H. Marsden, on a Matchless, beating him. Marsden and Brewen (8 Zenith) actually tied for time on two occasions. Hugh Gibson was often in the picture. He was once well beaten by D. C. Bolton when close to the finishing line, but his Bradbury had no equal in the sidecar class.

The times were remarkably close, the slight advantage of the 3½ h.p.'s over the best lightweights calling for special comment. The complete tabulated results, times, and speeds are given hereunder for comparison:

Standing Kilometre.

CLASS 6.—Racing motor cycles up to 500 c.c.

		secs.	m.p.h.
1.	G. E. Stanley (3½ Singer) ...	43⅕	51.75
2.	C. R. Collier (3½ twin Matchless)	43⅗	51.27
3.	J. Cocker (3½ Singer)	44⅗	50.12

CLASS 5.—Racing motor cycles up to 350 c.c.

1.	G. E. Stanley (2¾ Singer) ...	47⅖	47.16
2.	V. Busby (2¾ Sunbeam)	50⅕	44.53
3.	{T. C. de la Hay (2¾ Sunbeam) ... {F. S. Whitworth (2¾ Douglas) ...	51⅘	43.15

CLASS 10.—T.T. machines up to 500 c.c.

1.	J. Cocker (3½ Singer)	44⅘	49.89
2.	C. R. Collier (3½ Matchless) ...	46	48.60
3.	G. Hall (3½ Scale-Jap)	48	46.57

CLASS 18.—Racing passenger motor cycles and cycle cars up to 1,100 c.c.

1.	B. Heywood (10 Singer c.c.) ...	44⅗	50.12
2.	E. Longden (8 Dot-Jap sc.) ...	61⅖	36.55
3.	G. de Planta (10 Singer c.c.) ...	62⅕	36

CLASS 1.—Standard racing motor cycles up to 350 c.c.

1.	V. Busby (2¾ Sunbeam)	51⅖	43.69
2.	F. S. Whitworth (2¾ Douglas) ...	53	42.20
3.	R. E. Grice (2¾ Sunbeam) ...	56⅖	39.80

CLASS 4.—Standard touring motor cycles up to 1,100 c.c.

1.	H. J. L. Greatwich (5 twin Wright-Blumfield)	46	48.63*
2.	N. H. Brown (7 Indian)	50⅕	44.74
3.	W. H. Kelly (8 Rex-Jap) ...	54⅕	41.43

* Disqualified as machine was not "standard touring."

CLASS 7.—Racing motor cycles up to 750 c.c.

1.	G. E. Stanley (3½ Singer)	43⅕	51.75
2.	J. H. Fox (5 twin Matchless-Jap)	44⅖	50.35
3.	C. R. Collier (3½ twin Matchless)	45	49.68

CLASS 9.—T.T. motor cycles up to 350 c.c.

1.	F. S. Whitworth (2¾ twin Douglas)	48	46.57
2.	F. G. Edmond (2¾ twin Humber)	48⅕	46.37
3.	V. Busby (2¾ Sunbeam)	51⅖	43.49

CLASS 15.—For standard touring passenger machines up to 600 c.c.

1.	Hugh Gibson (3½ Bradbury) ...	57⅘	38.67
2.	V. E. Horsman (3½ Singer) ...	61⅘	36.43
3.	M. Rimmer (3½ Zenith)	66⅗	33.69

CLASS 8.—For racing motor cycles up to 1,000 c.c.

1.	J. J. Cookson (8 twin Matchless-Jap)	38⅕	58.52
2.	{A. J. Brewin (8 Zenith) ... ... {H. Marsden (8 Matchless) ...	39⅗	56.45
4.	H. Reed (8 Dot-Jap)	41	54.52

CLASS 2.—Standard touring motor cycles up to 600 c.c.

1.	J. Cocker (3½ Singer)	46	48.60
2.	H. Gibson (3½ Bradbury) ...	47⅖	47.16
3.	V. Horsman (3½ Singer)	48	46.57

CLASS 3.—Standard touring machines up to 775 c.c.

		secs.	m.p.h.
1.	J. Cocker (3½ Singer)	44⅖	50.35
2.	V. Horsman (3½ Singer)	48⅖	46.19
3.	A. J. Dixon (3½ Singer)	49⅗	45.07

CLASS 16.—Standard touring passenger machines up to 1,100 c.c.

1.	F. C. Topham (8 twin Dot-Jap sc.)	57⅕	39.08
2.	E. Longden (8 twin Dot-Jap sc.)	58⅕	38.41
3.	G. de Planta (10 4-cyl. Singer c.c.)	64⅖	34.84

CLASS 17.—Racing passenger machines up to 750 c.c.

1.	Hugh Gibson (3½ Bradbury) ...	59	37.88
2.	V. E. Horsman (3½ Singer) ...	64⅕	34.95

Flying Half-mile.

CLASS 11.—Racing motor cycles up to 350 c.c.

1.	F. G. Edmond (2¾ twin Humber)	30	60
2.	G. E. Stanley (2¾ Singer)	30⅗	58.82
3.	F. S. Whitworth (2¾ twin Douglas)	32⅖	54.87

CLASS 12.—Flying half-mile up to 500 c.c.

1.	G. E. Stanley (3½ Singer)	26⅖	68.18
2.	C. R. Collier (3½ twin Matchless)	27⅘	64.75
3.	D. C. Bolton (3½ Rudge-A.S.L.)	28⅘	62.50

CLASS 13.—Flying half-mile up to 750 c.c.

1.	G. E. Stanley (3½ Singer) ...	26⅗	67.67
2.	C. R. Collier (3½ twin Matchless)	27⅗	65.21
3.	J. H. Fox (5 twin Matchless) ...	28⅕	63.83

CLASS 14.—Up to 1,000 c.c.

1.	J. J. Cookson (8 Matchless-Jap) ...	23⅗	
2.	H. Reed (8 Dot-Jap)	23⅘	
3.	{H. Marsden (8 Matchless) ... ... {A. J. Brewin (8 Zenith)	24⅗	

The Handicap Events.

CLASS 19.—Standing kilo., open only to residents of twelve months or more within a five-mile radius of Colwyn Bay.

1.	R. E. Grice (2¾ Sunbeam)	51⅕s.
2.	N. J. Hall (3½ Ixion)	57⅖s.
3.	H. Lancaster (2¾ Douglas)	72⅗s.

CLASS 20.—Standing kilo. for the championship of North Wales. Open only to residents of twelve months or more in North Wales.

1.	J. H. Fox (Matchless)	42⅕s.
2.	R. E. Grice (Sunbeam)	53⅖s.
3.	R. F. James (N.S.U.)	52⅗s.

The winner of the Reliance Cup for the best aggregate performance is awarded to G. E. Stanley.

Observations.

It is now the custom in speed events to inspect carefully tyres and the type adopted—wired on or beaded edge. The popularity of each type could be fairly said to be divided, and we were particularly pleased to notice that security bolts were almost general in the case of beaded edge tyres. The fear of the cover creeping when travelling at speed and ripping the valve out of the tube is now too well known. We got a useful tip from W. H. Wells which had been adopted by the Indian riders as well as C. R. Collier. Mr. Wells has a weakness for shellac, his T.T. Indians are always swathed in tape and shellac, his latest use for the commodity is to spread it on the rims and edges of the cover and so stick them on.

J. J. Cookson's 8 h.p. Matchless had a J.A.P. engine of 90 mm. bore by 77.5 mm. stroke, and we noticed that he had fitted his Amac carburetter with an inverted needle working inside the jet to give a variable opening. He used a gear of 3 to 1.

The results of the different classes were announced at 8 p.m. on Saturday to an impatient crowd who could see no reason for the delay in the absence of a formula. As a matter of fact some of the positions were amended later.

CUMBERLAND COUNTY M.C.C.

A twenty-seven hours' reliability trial was held on the 28th and 29th ult. The course was from Carlisle, *viâ* Preston, Warrington, Lichfield, to Birmingham, and the return journey *viâ* Derby, Sheffield, Doncaster, Barnard Castle, and Appleby. There were seventeen starters. The results were—Solos: 1, J. Robinson (2¾ N.U.T.); 2, W. B. Little (3½ Premier); 3, B. Jefferys (7-9 Zenith). Sidecars: 1, T. B. Westmorland (5-6 Machless); 2, T. Wilkinson (5-6 Clyno).

Second English-Dutch International Trial.

THE respective teams for the above trial, which starts from Oxford on August Bank Holiday Monday, have now been chosen, and we give their names hereunder :

Private Owners.

ENGLISH TEAM.	DUTCH TEAM.
350 c.c.	
Geoffrey Smith (2¾ Humber)	A. L. Versluys (2½ 1-cyl. Eysink)
W. Cooper (2¾ Humber)	J. H. Nieuwenhuys (2¼ 1-cyl. Vulkaan)
F. A. Hardy (2¾ Douglas)	J. van Frankenhuysen (2¾ 2-cyl. Douglas)
Reserve: Glyn Rowden (2¾ Douglas).	*First Reserve:* G. Hogenkamp (2¾ 2-cyl. Royal Enfield).
500 c.c.	
F. Dover (3½ Premier), capt.	Joh. Ferwerda (5-6 4-cyl. F.N.)
C. Lester (3½ P. and M.)	J. M. Bergmans (4 1-cyl. Simplex)
A. R. Abbott (3½ Rudge)	A. Citroen (3½ 1-cyl. Rudge-Multi), capt.
Reserve: W. B. Little (3½ Premier).	*First Reserve:* R. R. toe Laer (4 1-cyl. Simplex). *Second Reserve:* N. Ruyter (3½ 1-cyl N.S.U.).
1,000 c.c.	
R. G. Charlesworth (6 Zenith)	A. B. C. van Dongen (7 2-cyl. Indian)
C. W. Wilson (Morgan)	S. Eweg (7 2-cyl. Indian)
R. E. Guest (8 Matchless sc.)	J. A. v. c. Garde (5-6 2-cyl. Clyno sc.)
Reserve: C. W. Meredith (3½ Bradbury), P. Newbold (6 Zenith).	*First Reserve:* "Pseud, Eddy" (4 1-cyl. Simplex). *Second Reserve:* P. H. J. van Waveren (7 2-cyl. Indian).

Trade Riders.

350 c.c.	
S. Wright (2¾ Humber)	L. J. Knoops (2½ 1-cyl. Eysink)
Reg. Holloway (2½ Premier)	D. v. d. Mark (2¾ 1-cyl. F.N.)
W. B. Gibb (2¾ Douglas)	Jos. Kerstens (2½ 1-cyl. Vulkaan)
Reserve: J. S. Holroyd (2¾ Motosacoche).	*Reserve:* H. de Vos Middenweg (2½ 1-cyl. Puch)
500 c.c.	
W. Pratt (3½ P. and M.), capt.	J. C. Neurdenburg (3½ 1-cyl. Rudge-Multi)
W. F. Newsome (3½ Triumph)	A. Eysink (3 1-cyl. Eysink)
F. C. North (3½ Ariel)	P. N. Jelsma (3 1-cyl. Eysink)
Reserves: Rex G. Mundy (3½ Triumph); D. H. Noble (3½ Rover).	
1,000 c.c.	
C. R. Collier (6 Matchless)	C. Witteveen (557 c.c. 1-cyl. M. James)
F. W. Barnes (6 Zenith)	P. Nieman (5-6 2-cyl. Simplex)
F. Smith (5-6 Clyno sc.)	J. L. Geidt (6 2-cyl. Cyclonette, three-wheeled cyclecar)
Reserve: D. Arter (James sc.).	

Last year, in Holland, the Dutch team scored a surprise victory. Should they win again this year, the trophy presented by Messrs. Ferwerda and Citroen becomes their property, but in the event of a British success the final will be contested in Holland next year.

Mr. Nico Jannink is the new president of the Dutch M.C.C.

Official cars are being lent by Messrs. Humber, Ltd., and Rudge-Whitworth, Ltd.

BRADFORD-LONDON-BRADFORD RUN LAST SATURDAY. Scene in the hotel yard at Grantham.

A. E. Parnacott climbing South Harting on his cycle car. In the amended results, his was the best figure of merit.

IN September, 1911, we discussed the question of hill-climbing formulæ at some length, and after considering the advantages of several formulæ, decided to recommend to our readers as the best compromise between simplicity and accuracy that formula which has since become known as *The Motor Cycle* formula, viz., $\frac{C \times t^2}{W}$ or, as it can be written for those who have not *The Motor Cycle* cubic capacity table, $\frac{D^2 \times S \times N \times t^2}{W}$ in which C = cubic capacity in c.cm., D = bore, S = stroke, N = number of cylinders, t = time (in seconds), and W = weight of machine and rider.

Several correspondents wrote to us on the subject and suggested more complicated formulæ, but we were able to show that the differences in the results given were infinitesimal, and *The Motor Cycle* formula has proved very satisfactory for all the usual hill-climbs in which motor cycles take part, that is to say, in hill-climbs where the fastest time is anything from thirty seconds to one minute, or thereabouts. At the same time, we are quite willing to admit that, on a very long hill or for slower vehicles, the time, if squared, may become the determining factor, and too little importance may be given to weight and capacity. For this reason Dr. Low has worked out the following interesting formula specially for cycle car competitions: $\frac{W}{(C - K)^2 \times t^p}$. W, C, and t are the same as before, while K and p are constants depending upon the capacity of the machines entered and the length and gradient of the hill. For South Harting K = 200 and p = 1.75, and these are the usual values. For our purposes, however, the presence of constants varying for different competitions is undesirable, and in comparing the results at South Harting given by Dr. Low's formula and *The Motor Cycle* formula, which we do simply as a matter of interest and not as an argument for or against either formula, it must be remembered that the ascent of the hill would have been made by motor cycles in from fifty to seventy seconds, and thus the time figure would not have become so prominent.

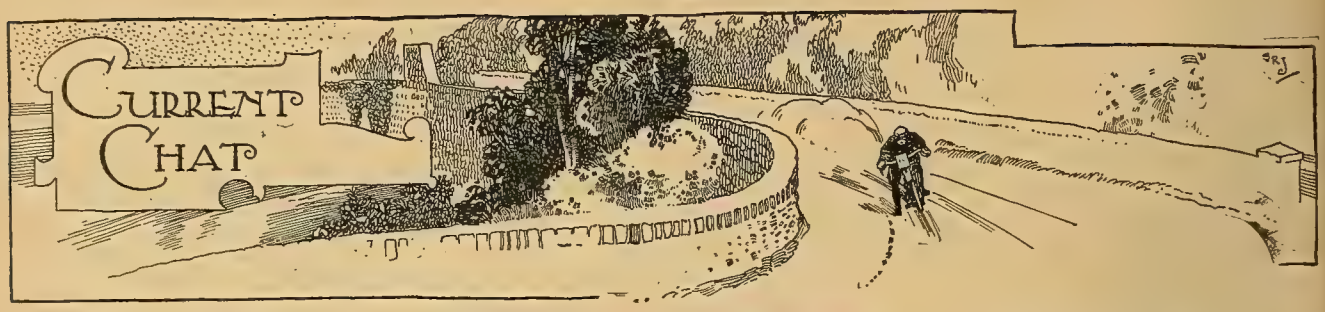
Corrected Results.

Immediately last week's issue had gone to press we discovered that the official results were inaccurate. It so happened that we obtained the official times and weights with the object of comparing results on *The Motor Cycle* formula, being so interested in this question, and in checking the "official" results discovered the errors, which we at once pointed out to the officials, and an amended list becomes necessary.

Machine and Class.	Weight. lbs.	Time. m. s.	Dr. Low.	*The Motor Cycle.*
Morgan (I.) ...	703 ...	1 35$\frac{2}{5}$ ...	.3206 ...	7855
Chota (III.) ...	1014 ...	2 29$\frac{2}{5}$ ...	.5274 ...	6083
Cycar (III.) ...	1060 ...	4 4$\frac{3}{5}$ ...	.7836 ...	3571
Zebra (III.) ...	1392 ...	5 26$\frac{2}{5}$ ...	.2817 ...	2026
Morgan (IV.) ...	956 ...	1 43 ...	.4647 ...	9143
Morgan (IV.) ...	970 ...	2 7$\frac{1}{5}$ ...	.2584 ...	5536
Morgan (IV.) ...	861 ...	2 6$\frac{1}{5}$ ...	.2310 ...	5606
Singer (V.) ...	1527 ...	2 14 ...	.3596 ...	7750
G.N. (V.) ...	962$\frac{1}{2}$ ...	1 50$\frac{4}{5}$ ...	.3247 ...	7220
G.W.K. (V.) ...	1372 ...	2 14$\frac{4}{5}$ ...	.3407 ...	7078

The figures given under Dr. Low's formula are official, with the exception of the Chota figure, which was obviously wrong; using the weight and time given officially, we make this figure .5274 instead of 2.096, thus Mr. Parnacott's Cycar becomes the winning machine and with a figure of .7834 (this, by the way, is calculated on a wrong capacity, the F.N. engine is not 499 c.c.).

We put this matter before Dr. Low, and since writing the above we have heard from him that the published times and weights are wrong, that his book contains weights, etc., quite different from those published, and that he has been told that "*the official weights cannot be found at the moment.*" This being the case, both Dr. Low and ourselves have been put to a great deal of unnecessary trouble, but the table given is still of some interest for purposes of comparison. We cannot, however, vouch for any of these figures in the unfortunate absence of reliable data.



TIME TO LIGHT LAMPS.

July	10th	... ...	9.14 p.m.
,,	12th	... ...	9.12 ,,
,,	14th	... ...	9.10 ,,
,,	16th	... ...	9.8 ,,

Kop Hill Open Climb Postponed.

Owing to the delay in sending out application forms, the Herts County A. and A.C. has postponed its hill-climb until August 9th. Entries will be received until the 26th inst.

Speed of the T.T. Winner.

We notice that a correspondent in our Scottish contemporary is questioning the official speed of 50.87 m.p.h. which, we believe, was published in all papers but *The Motor Cycle*. The correct figure being approximately 48¼ m.p.h., we have taken this matter up with the A.C.U. with a view to getting this mistake officially corrected, and it has, in turn, been referred to the official time-keepers.

A.A. and M.U. Notes.

SPECIAL ROAD NOTICE.—The Association has been asked to lend its assistance towards inducing motorists to moderate their speed when passing Dringhouses (1½ miles from York, on the York to Tadcaster Road). The local authorities are now prosecuting for driving to the danger of the public, and the resulting fines are invariably heavy. To make matters worse, the residents are irritated against motorists, who have killed valuable dogs and driven on without stopping.

CENTRAL TRAMWAY STANDARDS.—In view of the danger and inconvenience caused by obstructions of this type, the A.A. and M.U. has been in communication with the Board of Trade urging that the Board should oppose the erection of central standards and other permanent obstructions on the carriage way.

Warnings.

We are informed that the Glamorganshire police are busy in the following districts: Dynas Powis, Eastbrook, Cogan, Llandouch, Seckwith, and Wenvoe, through from Cardiff to Barry.

We hear that, in consequence of complaints of excessive speed through the village of Radcliffe-on-Trent, it is likely that a number of police traps will be put into operation. We urge our readers to ride with more care and circumspection in this district—in fact, in all districts. In many parts of the country the police are not hostile to motor traffic unless compelled to be so by the rashness of the drivers themselves. Riders of a certain class—about 1% of the whole, we imagine—do more to prejudice the interests of motorists than the remaining 99%.

FUTURE EVENTS.

July 13.—GRAND PRIX RACE. Motor Cycles, Sidecars, and Cycle Cars.
,, 14.—M.C.U.I. Irish End to End Open Trial.
,, 19.—Herts M.C.C. Open Half-Day Trial
,, 21-26.—Scottish Six Days' Trials.
,, 26.—B.M.C.R.C. Race Meeting.
Aug 2-3.—International Cup Race in France.
,, 2.—Hertfordshire M.C.C. Open Half-Day Trial.
,, 2-4.—M.C.C. Devon Trial
,, 4.—English-Dutch International Trial.
,, 4.—B.A.R.C. Meeting at Brooklands.
,, 9.—B.M.C.R.C. Race Meeting.
,, 18-23.—A.C.U. Six Days' Trials.
,, 30.—Herts M.C.C. Open Half-Day Trial
Sept. 6.—Coventry and Warwickshire M.C. Annual Open Hill Climb.
,, 13.—B.M.C.R.C. Race Meeting.

International Cup Race.

This trial, to take place on the 2nd and 3rd of August, is of considerable importance, and consists of two parts. There are 200 kilometres to be covered under touring conditions, and then a speed contest follows, in which 400 kilometres have to be covered. The course for the speed trial will be guarded by 1,200 men, and will be enclosed and provided with foot bridges.

SPECIAL FEATURES:

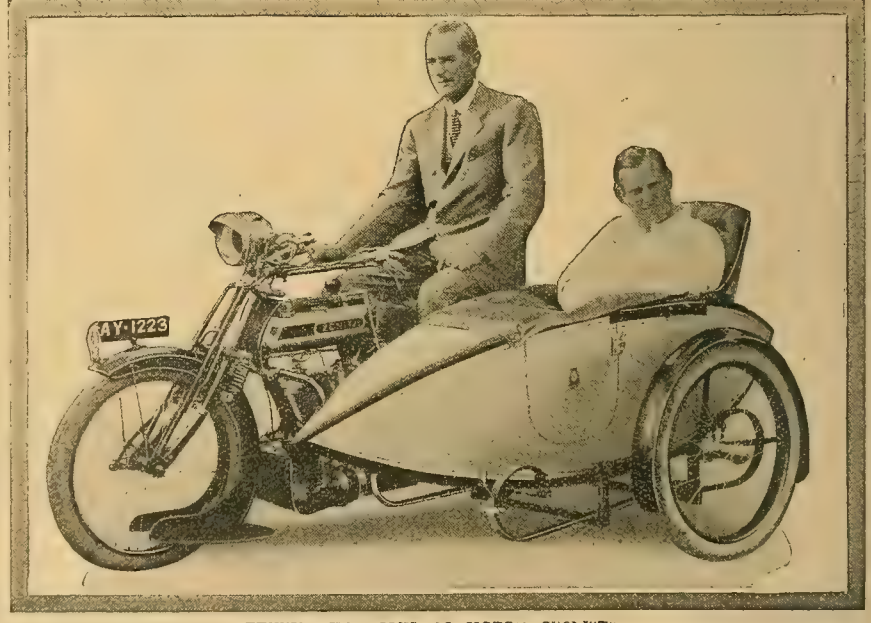
HILL-CLIMBING FORMULA.
NEW HILLS FOR THE SIX DAYS' TRIALS.
GRAND PRIX NEWS.

Official Figures at South Harting.

As we took the precaution of obtaining so far as possible the times, weights, and other figures of the competing cycle cars, we are able to draw attention to discrepancies in the official figures, but we cannot at present furnish reliable results. A. W. Lambert writes to say that his Morgan (two-seater) had an engine of 85×85 mm., 964 c.c. This will alter his figure to .3104 under Dr. Low's formula and 5606 according to *The Motor Cycle* formula, which gives him second place in Class IV.

Rear Lights.

Whilst a motor cyclist, accompanied by a lady in a pannier seat, was riding in the neighbourhood of Paris recently he was run into by a motor car from the rear. In the subsequent court proceedings, the judge remarked that the motor cyclist ought to have had a rear light, and gave a verdict for the motor car driver. On appeal, the plaintiff was awarded £24 damages.



TENNIS CHAMPIONS AS MOTOR CYCLISTS.

A. F. Wilding last week retained his title as the All England tennis champion by defeating M. McLoughlin. He is seated in G. W. Hillyard's Zenith-Gradua sidecar, the special features of which, including the Millford sidecar, have already been referred to in these columns. The engine is a special cycle car J.A.P. of 90 mm. bore by 85 mm. stroke, 10·8 h.p.

The Grand Prix.

Members of our staff are now in France in connection with the Motor Cycle and Cycle Car Grand Prix Races on Sunday. A descriptive report, with many illustrations, will appear in next Thursday's issue.

A Warning.

At the Kingston-on-Thames County Police Court on Thursday last week the Chairman (Lieut.-Colonel F. C. Turner) announced that, owing to the many complaints received as to excessive speed the fines imposed on motor cyclists would in future be the same as for motorists.

£5 Reward for Stolen Triumph.

Mr. Smith Whiting, 13, Carlton Road, Southampton, has had the misfortune to have had his 1913 three-speed Triumph stolen from the Stoneham Golf Club, Southampton, on July 4th. The machine number is 212,366, engine number 23,786, and it was lavishly equipped with accessories. Mr. Smith Whiting informs us that he is prepared to pay a reward of £5 for the recovery of the machine.

No Twin Rudge.

The other day we were assured by an acquaintance that he had seen a twin-cylinder Rudge motor bicycle on the road. It must have been an optical illusion, for we now have before us a letter from Rudge-Whitworth, Ltd., stating that the firm is not experimenting with, or even considering, any twin or other multi-cylinder motor cycle. The manufacture of the Rudge cycle car has not been continued owing to the extreme pressure in the works.

Motor Cyclists and the Army.

The Secretary of the War Office announces that any persons wishing to join the Motor Cyclist Section of the Royal Engineers (Special Reserve) should apply to the member of the Motor Cyclist Reserve Committee in the neighbourhood of their places of residence. All information regarding enlistment, etc., is contained in Army Orders, dated June 1st, 1913, which can be purchased through any bookseller

A Twin-cylinder Bradbury.

Hugh Gibson told us at Colwyn last week-end that he hopes to be mounted on the new 750 c.c. twin-cylinder chain-driven Bradbury with sidecar attachment in the English Six Days' Trials. The advent of this machine is eagerly looked forward to. Messrs. Bradbury and Co., Ltd., have had it in hand for some months, and it is sure to be an attractive mount from a firm with such a unique experience in the manufacture of motor cycles

Racing at Cambridge.

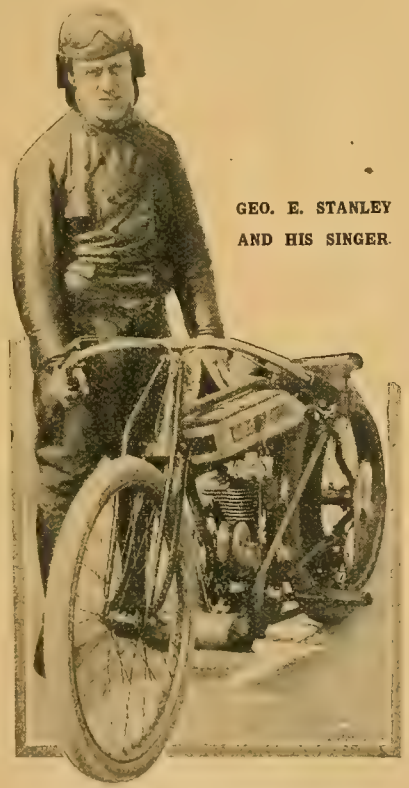
On July 3rd some successful motor cycle races were incorporated among the events at the charity sports on the Amalgamation Cricket Ground at Cambridge. Some well-known riders took part, including the redoubtable Harry Martin. Considering that the grass track was unbanked, the speeds were fairly high. In the three miles scratch race the result was: 1, Martin; 2, Barker. So keen was the struggle that the pair continued for several laps after the race was decided!

An Impossible (?) Hill.

Last week we referred to a hill near Llangollen which is described by "Bibendum" as an "impossible hill for motors." We now hear from a reader that he climbed this hill on the 22nd ult., riding a 1910 F.E. Triumph geared 6⅝ to 1.

Fatal Accident at Portmarnock.

The race meeting at Portmarnock was abandoned owing to a sad accident which occurred during the practise before the races. Two riders, J. Barrett and F. W. Parker, both of Dublin, came into collision, practically end on, when travelling at high speed, with the result that the former was killed on the spot and the latter so seriously injured that his recovery is doubtful. This is the first serious accident that has occurred at Portmarnock.



GEO. E. STANLEY AND HIS SINGER.

G. E. Stanley, the well known Singer exponent who gained five firsts at the Colwyn Bay Speed Trials last Saturday. Stanley is left handed and always mounts by the right footrest of his machine.

A Proposed Scottish T.T.

After the recent very successful race meeting promoted by the East of Fife M.C.C. on the sands at St. Andrews, some discussion arose as to the prospect of holding an open meeting over a distance of, say, twenty miles on the seashore. Several of the more prominent Edinburgh, East of Fife, and Glasgow racing men have expressed themselves as entirely favourable to the idea, and there can be little doubt that the event will materialise. There are, of course, objections to such a meeting, such as the large number of turns on the course, and the possibility of a wet day, which would render the event null and void, but, given a fair day, there is no reason why the event should not be a success.

The Six Days' Reliability Trials.

A fortnight ago we published photographs of the Scottish Trials course. This week we publish the first photographs of hills to be included in the English Six Days' Trials next August.

Irish End-to-end Trial.

Next Monday the annual Irish End-to-end Trial starts from Goleén immediately after the stroke of twelve on Sunday. The Palmer Trophy is the chief award.

A.C.U. SIX DAYS' TRIALS.

THE Six Days' Trials this year will, we are confident, eclipse those of last year in point of severity, as not only will the course be more strenuous, but, as will have been seen by the summary of the regulations published in our last week's issue, the conditions will be far more stringent.

Mr. Loughborough, the A.C.U. secretary, has just returned after nearly a fortnight's absence at Carlisle, where he has gone into the smallest details with the local authorities and the Cumberland County M.C.C. The official hotel will be The Central, where competitors will be lodged at 7s. 6d. a day, while the twelve senior officials of the trial will stay at the Crown and Mitre. Other hotels are the County and Red Lion, while there are numerous hotels and boarding houses about the town. Intending competitors are advised to book their rooms early.

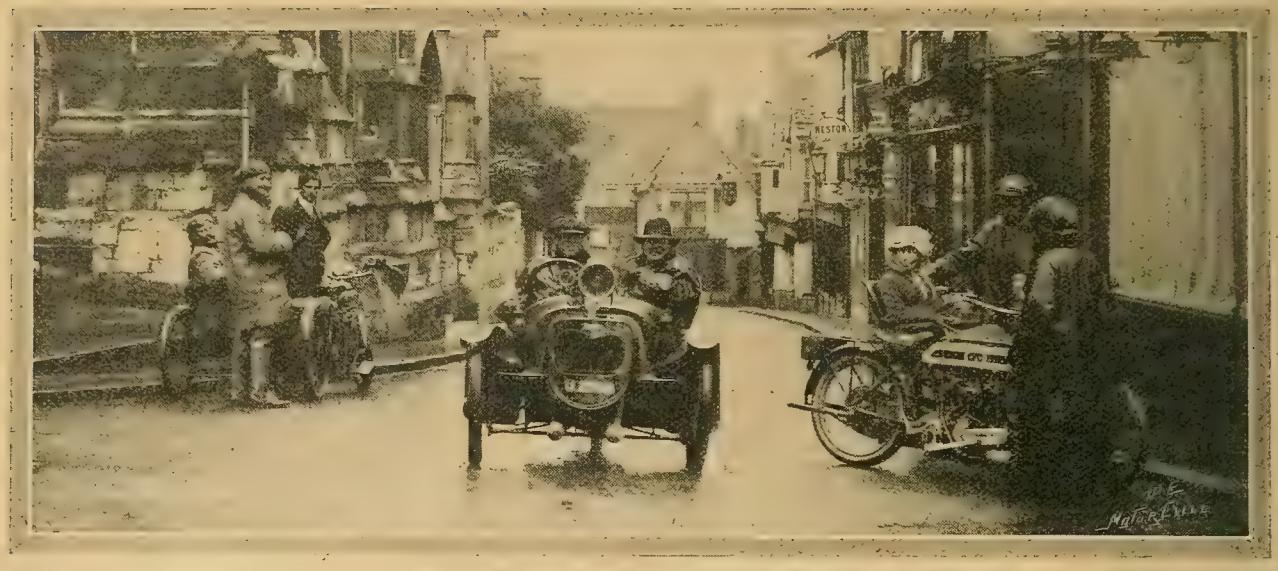
Durham in the Six Days' Trials.

The routes will be published early in August, probably just after the entries close on August 6th. Mr. Loughborough recommends the Competitions Committee to adopt a series of routes, which comprise three days in Lakeland, one in North Yorkshire, and one in Durham. He considers the day's route in Durham will prove the most severe of the lot. In the course of the trial the highest public house in England, on the summit of Tan Hill, will be passed. It is really the highest inn, as it stands 1,727 feet above sea level. It is interesting to note also that Alston, the highest town in England, will also be traversed during the trials. Mr. Loughborough, who was accompanied by Mr. Greenhill, chairman of the Competitions Committee, received the greatest assistance from Mr. G. P. Abraham, the well-known mountaineer and *The Motor Cycle* correspondent in the North-west of England. Mr. Abraham has a wonderful model of the country round the Lakes which occupies a whole room, and affords an interesting study for those who have the opportunity of seeing it.

The speed trials will probably be held in Lowther Park, the seat of Lord Lonsdale, near Penrith.

It is interesting to have to record that the Chief Constable of Carlisle is a motor cyclist.

Mr. Loughborough is very well pleased with the result of his visit, and received plenty of encouragement from the local residents. Local motor cyclists and those staying in the Lake District who would care to help the A.C.U. are requested to communicate with the secretary at 89, Pall Mall, S.W.



Bradford M.C.C. inter-team trial to London and back. Through rain and narrow streets in Stamford Town.

BRADFORD-LONDON AND BACK.

The long distance reliability trial for the Dyson trophy was held by the Bradford M.C.C. last week-end. Invitations were extended to different clubs to send teams to compete, and the start was on Friday evening. Rain was experienced on and off throughout the trip, and the competition proved much more severe as a result. Owing to the rain, the club decided to finish the ride some five miles away from the intended place. The results are not available for this issue.

WINNER OF A DUTCH MILITARY CROSS-COUNTRY RIDE.

H. Meyer, Editor of a Dutch motor cycle paper, on his 2¾ h.p. twin Humber. He won the Vermeil medal offered by the Territorials in a 50 miles cross-country ride for military motor cyclists last month. There were 46 competitors. Queen Welhelmina and the Prince Consort witnessed part of the contest.

A.C.U. SILENCER TRIALS.

JUDGES' SUPPLEMENTARY REPORT.

A supplementary report has been issued by the judges on the recent A.C.U. silencer trials. In this it is stated that the standard silencer being taken as a basis, the markings were given as follows: (*a*) Degree of noisiness as compared with standard; (*b*) weight; (*c*) volume; (*d*) general practicability.

Various criticisms of the first report have appeared in *The Motor Cycle*, especially on account of the non-publication of back pressure figures. The judges, however, point out that these were withheld on account of the misunderstandings which they were likely to cause. It must be remembered that a silencer which is particularly good in some respects may fail lamentably in others, thus the marking was rendered particularly difficult.

The tabulated results published herewith will show the results obtained, the marking having been agreed to by the committee. It is claimed that nothing could be gained by publishing further data.

MARKINGS.

BACK PRESSURE OF STANDARD SILENCER, .53 AND .8 LB. TO THE SQUARE INCH.
ENGINE REVOLUTIONS WITH STANDARD SILENCER, 1,815 AND 965.

Name of silencer.	Slow engine speed, bench test.	Fast engine speed, bench test.	Back pressure, lb. per square inch.		Marks for noisiness.	Total of all marks allotted.	+ is noise less than standard? — is noise worse than standard?
	r.p.m.	r.p.m.					
Warby	960	1,830	.15	.58	5.5	21.5	—
A.B.C.	950	1,830	.25	.54	6.1	26.2	—
Lyell	970	1,840	.35	.73	5.4	19.9	—
Lyell	950	1,840	.27	.68	9.2	26.4	Equal
Davis	960	1,840	.35	.73	7.5	24.5	Equal
Hutton	960	1,810	.41	.96	9.6	30.7	+
Hutton	970	1,810	.60	1.10	8.1	26.7	—
Dawson	950	1,780	.73	1.44	9.9	29.8	—
Sharpe	920	1,720	8.0	8.0	7.3	21.6	—
Sharpe	930	1,750	7.5	10.0	3.0	13.0	—
Ryder	970	1,870	4.5	4.5	4.3	14.6	—
Chase	970	1,870	.33	.56	9.6	33.2	Equal
Dunlop	970	1,800	.64	1.14	7.0	24.0	Equal
Rover	950	1,860	.31	.77	10.4	33.3	+
Rudge	990	1,900	.19	.25	4.1	25.2	—
Rudge	990	1,840	.49	1.0	6.7	25.4	—
Lyell	990	1,900	.37	.73	6.6	21.2	—

From the results obtained the following conclusions may be drawn: (1.) The gases should have a free entrance to a large expansion chamber. (2.) If a large chamber is not possible, deflecting blades are desirable. (3.) When reduced in pressure and temperature, the gases should be passed through a pipe or other device to damp out pressure variations. (4.) Silencers should be built solidly.

SPEEDS IN THE GRAND PRIX.

As it may be interesting for spectators to be able to read off the speed of the competitors in miles per hour from the lap times, we give a table showing the speed when the lap (17½ km.) is completed in any time (varying by half-minutes) from ten minutes to twenty minutes per lap :

mins. per lap.	m.p.h.	mins. per lap.	m.p.h.
10	65.22	15½	42.12
10½	62.14	16	40.82
11	59.33	16½	39.52
11½	56.78	17	38.36
12	54.45	17½	37.27
12½	52.27	18	36.25
13	50.16	18½	35.28
13½	48.31	19	34.35
14	46.60	19½	33.45
14½	45.00	20	32.61
15	43.52		

IRISH END-TO-END TRIAL.

The Irish End-to-end Run on the 14th inst. promises to be quite a big affair this year. Entries did not close until yesterday (Wednesday) morning, but those received up till Tuesday night ensured a successful event. It is the only Irish trial recognised by the Manufacturers' Union, and consequently the trade has supported the event very liberally, the English trade being well represented. The trial will be run from south to north as usual, and will start from Goleen one minute after midnight next Sunday. The route is much the same as in former years, as also are the regulations. The riders will follow the main road to Cork and Dublin, where new arrangements as to checking will be made to obviate the possibility of those who are behind time travelling too fast through the city. The northern end of the course has been altered to take in some severe hills near the finish. These will be observed and special marks awarded for clean ascents. In this way it is hoped to divide the survivors. Last year the winner of the Palmer trophy had but a few seconds less variation from standard time than the runner up; the new arrangements will make the awards less of a lottery than in the past.

SOME LATE CLUB RESULTS.

Cambusslang M.C.C.

A petrol consumption test took place recently. Results. 1, T. E. Roberts (2¾ Humber), figure of merit, 12.1; 2, O. Sproul (3½ Triumph), 11.4; 3, A. Doig (2¾ Douglas), 10.2.

Southampton and District M.C.C.

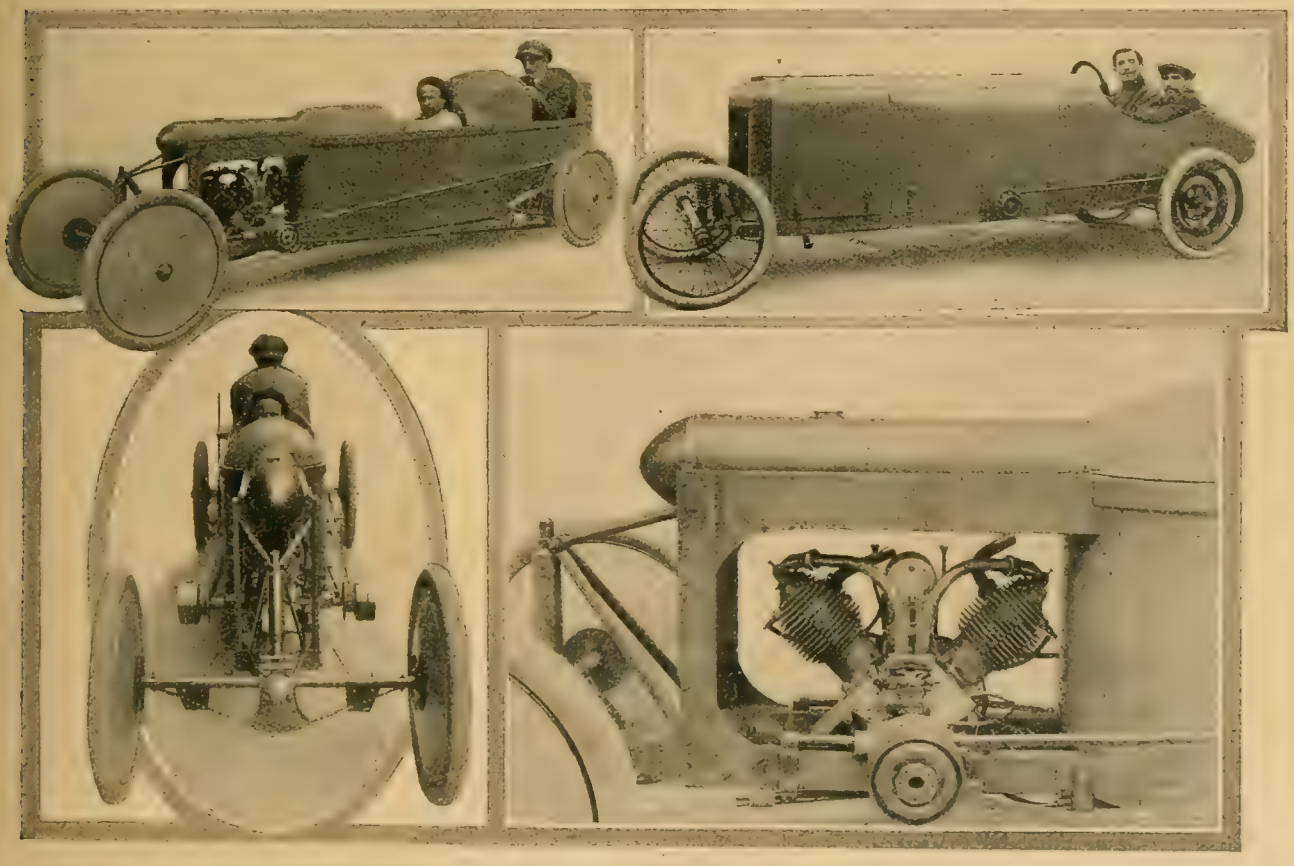
The annual hill-climb took place on the 2nd inst. at Dean Hill, near Salisbury. The hill is over half a mile in length and fairly steep. Results: Solo class. 1, W. H. Winckworth (4¼ Sun-Precision), 51s.; 2, F. Tappenden (3½ Premier); 61s. Passenger class. 1, F. Tuffin (3½ New Hudson sc.); 2, J. W. Silvey (3¾ Sun-Precision sc.). Miss B. Sims experienced hard luck, her belt breaking when half way up.

Helensburgh M.C.C.

The results of the petrol consumption test over a distance of twenty miles are as follows, the formula used being $\frac{W \times X}{P}$ W = weight of rider and machine, P = petrol in ounces, and

$$X = \frac{\text{capacity} - 200}{1{,}600} + 1.$$

	Fig. of Merit.
1. J. H. Murray (2¾ A.J.S.)	21.15
2. H. W. Ballardie (5 Hazlewood) ...	14.85
3. D. F. Macnab (3½ Quadrant) ...	13.25

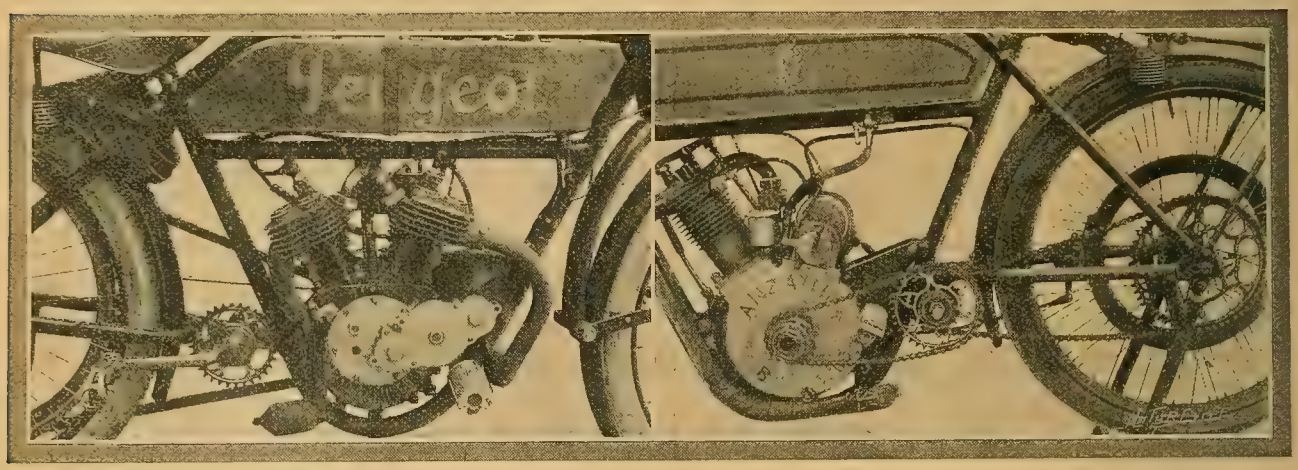


CYCLE CARS IN THE GRAND PRIX RACE.

(1) The Grand Prix Bedelia.
(2) The long racy looking Automobilette, propelled by a four-cylinder engine.
(3) Front view of the wind cutting Bedelia.
(4) The Bedelia twin-cylinder power unit. Observe the short exhaust pipes.

THE GRAND PRIX.

English Lack of Knowledge of the Course. The Competing Machines.



Latest twin Peugeot engine which has side by side mechanically operated valves. New Anzani engine on the Alcyon Grand Prix machine.

Some French Speed Ideas.

A study of many of the competing machines hailing from the other side of the Channel, both cycle and motor cycle, shows an interesting combination of past and possibly future ideas.

At last, after years of faithful adherence to the atmospheric valve, the Peugeot firm have fitted their motor cycle engines with mechanically operated valves of the side by side pattern, but they still doubt the excellence of the rubber belt. The Truffault spring forks are fitted. An enormous car type carburetter is used, the float chamber apparently holding about a pint of petrol! Our illustrations give an admirably clear view of the details of both this and several other machines. It is interesting to note that the French machines have at least one English fitting—the Brooks saddles.

The Anzani engine fitted to the racing Alcyon is an interesting production. Its general design is exceptionally neat, but the inlet valve is automatic, and apparently it is necessary to remove the cylinder to replace the valve.

One of the most interesting power plants is found in the Clément. This is the M.A.G. motor, and is precisely similar to the engine used in the T.T., when we fully described it. An Enfield two-speed gear and chain drive are fitted, and it is confidently expected that it will give a very good account of itself.

The Astonishing Cycle Cars.

For real *outré* ideas one must study the Bedelia. Here we have a belt-driven machine, the belt of which measures about 20ft., the drive being direct from the engine to the road wheels. In order to reduce or raise the gear, pulleys, apparently working on the Philipson principle, are employed, and the engine is shifted backwards and forwards on a bed by means of a worm gear worked by the driver to slacken and tighten the belt.

The Automobilette is interesting because it is a remarkable mixture of true car and true motor cycle practice. A water-cooled four-cylinder motor is employed, and the belt pulleys are driven by a shaft from the engine clutch to the gear box placed in the middle of the chassis. The front suspension is *à la* Bedelia.

The Super is the only tandem-seated machine in which the driver sits in front of his passenger, and thus has a clear view of the road ahead.

L. Messervy, who was to have driven one of the Grand Prix Duos, collided with a taxicab and injured his arm so badly that he will be unable to drive.

Excursions to the Race.

The South-Eastern and Chatham Railway will run the following excursions to Amiens on July 10th, 11th, and 12th, available by the 10 a.m. and 2.5 p.m. service from Charing Cross, *via* Boulogne, and the 9.30 p.m. *via* Calais, and returning from Amiens at 9.20 a.m. and 4.55 p.m. *via* Boulogne and 11 p.m. *via* Calais. These tickets will be available for fifteen days at the following fares: First class, 42s. 6d.; second class, 30s. 6d.

The List of Competitors.

Below is a complete list of entries given in the order of starting. It will be seen that the British motor cycle industry is well represented by B.S.A., Clyno, Douglas, Premier, Regal-Green, Rudge, Triumph, and Zenith, and British cycle cars by G.N.'s, Duo, Morgan, Marlborough, and Bolton-Precision, though we hear the last-named is not sufficiently advanced to come to the starting line.

11.	Super.	23.	Ronteix.
12.	Violet-Bogey.		

Practising Notes.

Matters have been very dull for the spectators who turned out during the limited practising hours, for, singularly, few of the competitors have been able to take the opportunity of acquiring a knowledge of the course. Of the cycle cars, the only ones to put in an appearance during the very limited period provided for practising have been the French makes. None of the English machines have been seen on the course at all, nor has anything been heard of the Mathis from Strasbourg. The Mathis is probably more feared by the French than any other foreigner in the race, and for that reason everyone has been looking forward to seeing it put through its paces round the course. But Strasbourg is a long way

The Triumph team in the Grand Prix race next Sunday : A. Clayton, W. F. Newsome, and E. W. Cheshire.

from Amiens, and it is absurd to expect makers to travel an immense distance for what amounted to four and a half hours' practising nearly a fortnight before the race, and then when the course was closed to go home and come again to Amiens for the contest.

English Unpreparedness.

The case is much the same with our own competitors, for although it is quite a simple and inexpensive matter to run over to Amiens from London, it is impossible to do so at a moment's notice, and this is what would have been necessary, for the authorities gave no notice of the time allowed for practice, and, owing to the obstinacy of the local authorities, it was found that a meagre one and a half hours early in the mornings of July 1st, 2nd, and 3rd was all that could be arranged for. No effort seems to have been made by the racing authorities to communicate with any competitors except the Frenchmen, a proceeding very unfair to all foreigners, and great indignation is felt in many quarters.

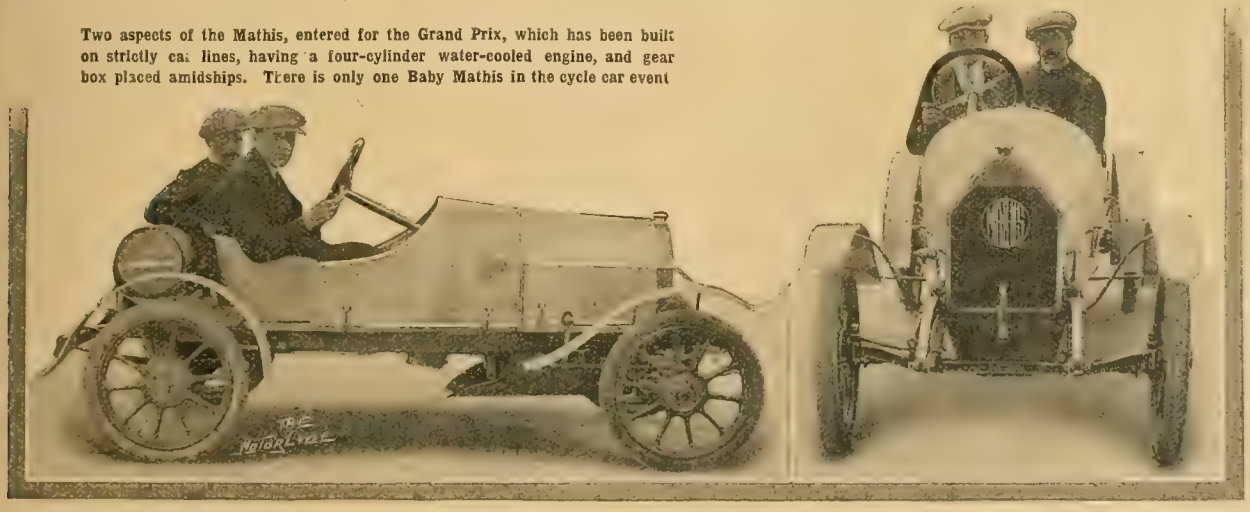
It is all very well to argue that we have Brooklands on which to tune up the competing machines. No place is finer for the purpose, we admit, but what is wanted to win a race is a road driver as well as a road machine, and quick corner work, not to be learned at Brooklands, will play an important part in securing a win in France.

The French, of course, have availed themselves of the restricted period for practising, and two each of the Ronteix, Violet-Bogey, Bedelia, and Sphinx among the cycle cars have been hard at work on the course. The last-named is the French edition of the English Globe. The Violet has covered a lap at a speed of nearly 63 m.p.h. This is bound to tell its tale in the race, for there will be no further opportunity of acquiring a knowledge of the course before the race itself, unless the regulations are relaxed, which appears unlikely. With regard to the motor cycles our position is not so serious, as most of our riders have had more experience on the road in the Isle of Man than the French have had, and probably the English machines are faster—though it would not be well to pin too much faith on this surmise, as the René-Gillet, Peugeot, and Terrot machines are reported to be very fast. By the way, H. Lamb, one of the firm's testers, will ride a Premier in place of Reg. Holloway, who has not yet sufficiently recovered from his recent accident.

Arrangements for the Race.

Depots are being established in the neighbourhood of the course by various firms, and we learn that Messrs. Rudge-Whitworth have secured quarters at the Café du Commerce, Boves, about five miles from Amiens and practically abutting on the course. The first machine in the 350 c.c. class will be sent away at 6 a.m. on the 13th inst., but owing to the considerable number of the entries and the shortness of the circuit, 17½ km., it is quite likely that the riders will be started in rows of three or four at a time. The 500 c.c. class will start next, while the sidecars and cycle cars will decide their struggle on the afternoon of the same day. One of the most interesting vehicles is the little Mathis cycle car, or baby car would be a better term, for it is a perfectly proportioned car in miniature, and has nothing of the cycle about it except that it comes under the A.C.U. definition for cycle cars. It is fitted with a four-cylinder water-cooled engine of 58 bore×100 stroke, and is driven through a three-speed and reverse gear box by a cardan-shaft and live axle. 650×65 mm. tyres are fitted to wood detachable wheels. Its weight is approximately 6 cwt. 3 qrs. It will be interesting to see how this car type of cycle car will fare under racing conditions opposed to the belt-driven type. The speedy Morgans are relegated to the sidecar class owing to their being three-wheelers, but as they are competing at the same time as the cycle cars, we shall get interesting evidence as to the speed and reliability of the car type, the belt-driven type, and the three-wheeler type as opposed to the sidecar and motor cycles.

Two aspects of the Mathis, entered for the Grand Prix, which has been built on strictly car lines, having a four-cylinder water-cooled engine, and gear box placed amidships. There is only one Baby Mathis in the cycle car event



M.C.C. Fifth Annual Race Meeting at Brooklands.

A LARGE AND SUCCESSFUL PROGRAMME.

THE Motor Cycling Club's annual Brooklands meeting is always a bright and interesting event, and this year's programme proved no exception. A large number of well-known riders took part in the various races, and, though the onlookers were not numerous, this could hardly be expected, as there were many other week-end open events to act as counter-attractions.

The weather was kind, and though the sky was clouded throughout the meeting only a light rain fell, and this was not sufficient to spoil the racing. All the events started and finished at the fork, and it was here that the spectators gathered to watch the proceedings.

Event I.

Racing started at 1-45 p.m. with a two-lap handicap event for machines with engines up to 350 c.c. Of the fourteen entrants, all started, the Douglas machines getting away quickest almost without exception; in fact, several riders of this make paddled off, and were soon going at a good pace. At the end of the first lap, Percival (Douglas) was leading, followed by Sir R. K. Arbuthnot, Purchase (Douglas), A. V. Sumner (2¾ Zenith), Le Grand and Jacobs (Singers), Wilberforce (Douglas), and Seed (Douglas). On the next lap, Jacobs and Le Grand picked up in fine form, the former winning by about 25 yards, with Sir R. K. Arbuthnot second, and Le Grand third. The last-mentioned would probably have run into second place, but was considerably slowed by a flat front tyre. The next to finish were Percival, Sam Wright, and Seed, whose stand was trailing. Wilberforce finished with a flat back tyre. W. Cooper (2¾ Humber) caused some amusement by riding with his shoes protected from oil by rag. Results:

		s.	m.	s.	m.p.h.
W. A. Jacobs (1-cyl. Singer) ...	69×93	8	5	51	=55.72
Rear Admiral Sir R. K. Arbuthnot (2 Douglas)	61×60	30			
J. P. Le Grand (1 Singer)	69×93	8			

Event II.

The second event was another two-lap handicap race for machines with engines exceeding 350 c.c., but not exceeding 560 c.c. C. W. Meredith (Bradbury), who is better known in long-distance trials than on the track, unfortunately got up a wobble and fell, but was not seriously hurt. Shaw (P. and M.) got away very well, and appeared very fast, and O. C. Godfrey went away better than anyone; he was riding the single-cylinder Indian which he used in the T.T. and the Grand Prix de Fontainebleau, but it seemed rather low-geared for track work. De Lissa's Motosacoche was fitted with his patent exhaust valve, but this machine also was geared too low. At the end of the first lap, Newsome (Rover) had worked his way to the front, and was riding magnificently. He was followed by Shaw, Meredith, Noble (Rover), R. E. Guest (Matchless), H. A. Collier, and S. F. Garrett (Regal-Green), who had lost some time by a slow start. Colliver, on a single-cylinder Indian, was suffering from float chamber trouble, but was fast when going properly. Collier was going grandly, and soon picked up the field, winning comfortably, with Guest in the second place, and Shaw lying third. Newsome came fourth, having dropped back owing to plug trouble, which dogged him throughout the day. Results:

		s.	m.	s.	m.p.h.
H. A. Collier (2-cyl. Matchless)	64×77	8	5	11	=62.87
R. E. Guest (1 Matchless) ...	90×77.5	14			
P. Shaw (1 P. and M.)	85×88.9	42			

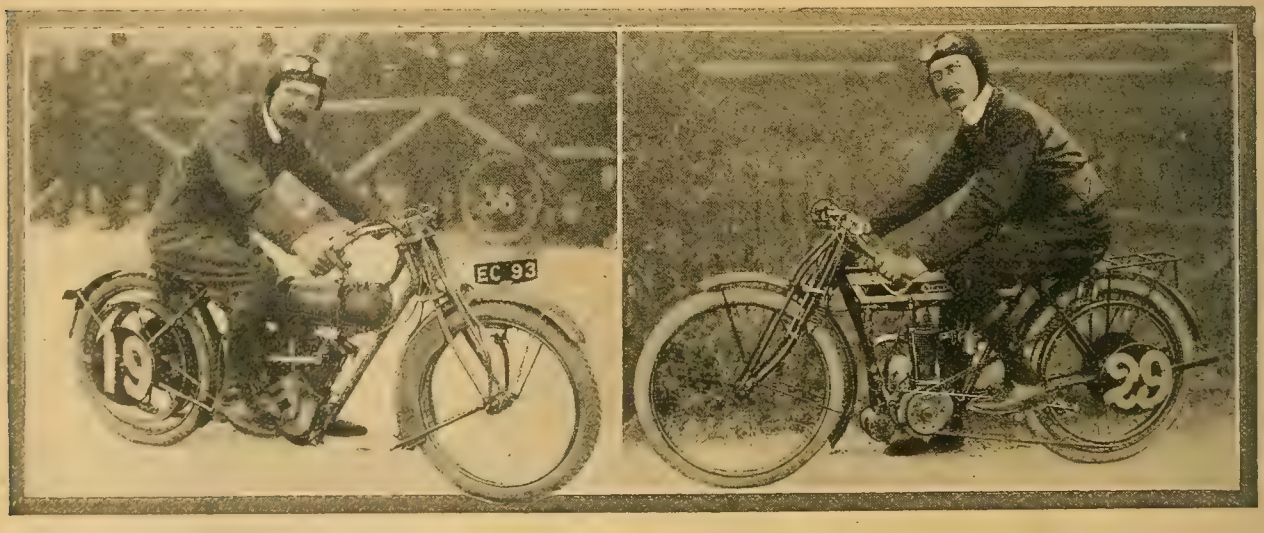
Event III.

Scratch race of three laps, up to 350 c.c. As usual, the Douglases were first away, but they were overhauled by Jacobs, Le Grand, and Sam Wright, who stuck together throughout the first lap. Sir R. K. Arbuthnot came next, but it was obvious that, except for accidents, one of the three leaders must win. Jacobs was still in front at the end of the second lap, but Wright was pressing him hard less than a length behind. The Admiral had run into third place, as Le Grand had had his belt come off. He passed sixth, gaining ground quickly, but shortly afterwards the same thing happened again, effectually putting him out of the race. This left Jacobs and Wright to fight for first place, and the former succeeded in pulling off the race by a small margin. In each scratch race the first five to finish were eligible to start for the club championship for the Harry Smith gold challenge cup, which event took place last of all. Results:

		m.	s.	m.p.h.
W. A. Jacobs (1-cyl. Singer) ...	69 ×93	8	46	=55.72
S. Wright (2 Humber)	60.7×60			
Sir R. K. Arbuthnot (2 Douglas)	61 ×60			
V. Wilberforce (2 Douglas) ...	60.5×60			
J. P. Le Grand (1 Singer) ...	69 ×93			

Event IV.

Three-lap scratch race for machines above 350 c.c. and up to 560 c.c. There was a good entry for this event, but unfortunately six were non-starters. Nearly everyone got away well with the exception of N. O. Soresby, who had quite a struggle. Collier assumed the lead at once, followed by Newsome, Guest, Pullin, and Godfrey. This order was unchanged at the end of the first lap.



H. A. Collier (3½ h.p. Matchless), who has returned to form and won three races on Saturday at Brooklands.

W. A. Jacobs (2¾ h.p. Singer) winner of two events.

M.C.C. Fifth Annual Race Meeting—

During the second lap Collier increased his lead, and Guest was running second followed by Rowlandson, whose Rudge was missing slightly owing to plug trouble, and Pullin. Newsome's Rover was obviously slowing up, and Soresby suffered both belt and plug trouble. Collier romped home an easy winner, with Pullin second and Rowlandson third. Results:

		m. s.	m.p.h.
H. A. Collier (2-cyl. Matchless)	64×77 ...	7 58⅘	=61.50
C. J. Pullin (1 Rudge)	85×88		
S. A. Rowlandson (1 Rudge) ..	85×88		
R. E. Guest (1 Matchless)			
D. H. Noble (1 Rover) ...	85×88		

Event V.

A three-lap scratch race for machines over 750 c.c. and up to 1,000 c.c. This race drew only three entries. Mariani (Indian) got away well, but Collier was slow off the mark. Sumner (Zenith) led at the end of the first lap with Collier pressing him and shortly afterwards passing him and finishing an easy winner. Sumner's machine was rather new and apt to dry up. Mariani was suffering from missing, apparently due to over lubrication. Results:

H. A. Collier (2-cyl. Matchless)	90 ×77½ ...	7 15	=67.33
A. V. Sumner (2 Zenith) ...	90 ×77½		
A. Mariani (2 Indian)	82½×95		

Event VI.

Two-lap scratch race for motor cycles not exceeding 650 c.c. to run on benzole. First prize presented by Mrs. Jarrott. Rain started to fall just before this race, but fortunately it was not heavy enough to spoil the proceedings. Collier again proved an easy winner. At the end of the first lap he was followed by Pullin, Newsome, Rowlandson, Soresby, and Garrett. Newsome, however, picked up and ran into second place, being chased home by Rowlandson and Pullin. Results:

H. A. Collier (2-cyl. Matchless)	64×77 ...	5 23⅘	=60.46
C. T. Newsome (1 Rover) ...	85×88		
S. A. Rowlandson (1 Rudge) ...	85×88		

The benzole used in this race was provided by the A.A. and M.U.

Event VII.

This race was a handicap for any type of car, distance three laps. Two cycle cars competed, a Chater-Lea driven by W. Chater-Lea and a four-cylinder Wilton driven by C. F. Halsall, the latter proved the winner at a speed of 52.10 m.p.h. The Wilton came in for a lot of favourable comment. Its engine has a most healthy buzz.

Event VIII.

A two-lap handicap sidecar race for single-cylinder machines. Harold Karslake (Rover sc.) was started off the limit mark and got away very well; he came in for a good deal of good natured chaff over the pink sweater he was wearing. Newsome also got away in fine style, but Garrett's passenger, who assisted in pushing off, caused some amusement by his method of getting into the sidecar. Karslake still led at the end of the first lap, but Newsome passed him before they were out of sight, his combination going in particularly good form. Garrett also was going very well and rapidly overhauling Watson (Swift). A. V. Sumner (Zenith-Green) travelled well, but was not quite fast enough to pick up his handicap. Newsome appeared to be an easy winner on the last lap, but his engine suddenly slowed once again, and just before the finish Garrett shot past and won by about forty yards. Results:

S. F. Garrett (1 Regal-Green sc.)	scr.	85×88	7 48	= 47.96
C. T. Newsome (1 Rover sc.) ...	16s.	85×88		
H. Karslake (1 Rover sc.) ...	60s.	85×88		

Event IX.

Two-lap handicap for twins and sidecars. Only three entries were received, de Lissa (3½ Motosacoche sc.) and Bell (F.N. sc.) receiving 1m. 38s. start from Sumner (8 Zenith sc). This handicap did not prove sufficient, for Sumner soon took the lead, and won with great ease. de Lissa was second, having run very steadily and fast for the size of his engine. Bell caused some amusement by slowing up as he passed and enquiring if there was any chance of the others breaking down. Results:

A. V. Sumner (2-cyl. Zenith) ...	90×77½	scr.	6 17	= 52.0
O. L. de Lissa (2 Motosacoche) ...	64×77½	1 38		

Event X.

This was a ten-lap handicap for cars for the Albert Brown Challenge Trophy. Once again Halsall drove his little Wilton to victory at an average speed of 54.31 m.p.h. The machine ran with the utmost regularity, and made a very fine performance.

Event XI.

Club Championship for the Harry Smith Gold Challenge Cup. Distance, ten laps handicap. Starters: Scratch, A. V. Sumner; 1m. 10s., H. A. Collier, C. G. Pullin, S. A. Rowlandson and D. H. Noble; 4m. 50s., W. A. Jacobs, S. Wright, V. Wilberforce, and J. P. Le Grand. This race was looked upon as the most important of the day. Everyone got away fairly well, but Sumner was particularly smart. The smaller machines completed well over a lap before the scratch man started. Jacobs, Le Grand, and Wright being all in a bunch. Pullin dropped out of the race in the fourth lap, the order at the end of the fifth lap being Jacobs, Wright, Le Grand, Collier, Rowlandson, and Sumner. Collier was rapidly picking up, and looked like a winner. In the 7th lap Sam Wright was dropping back. He appeared to be suffering from belt slip, and to be using his foot as a jockey pulley. In the eighth lap Collier took the lead, and Sumner, who was making a game fight, picked up two more places. Jacobs was lying second, and Le Grand third. This order was maintained till the last lap, though Collier gradually increased his lead. In the last lap Jacobs and Le Grand changed places, after riding most consistently throughout. Their little Singers and Wright's Humber were easily the fastest lightweights of the day, and had matters their own way. Results:

	mm.	H'cap.	Time.	m.p.h.
H. A. Collier (2-cyl. Matchless)	64×77	1 10	25.0	=65.22
J. P. Le Grand (1 Singer) ...	69×93	4 50		
W. A. Jacobs (1 Singer) ...	69×93	4 50		

Sumner came in fourth, and Rowlandson fifth.

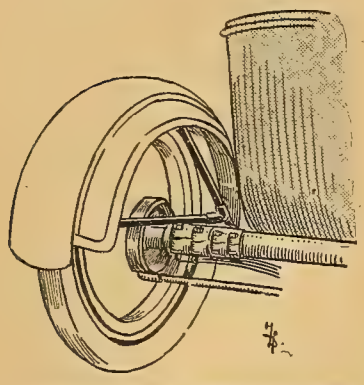
Thus ended a very enjoyable day's sport. The organisation was excellent throughout, and there were no delays except for a short wait while one competitor attached a sidecar to his machine. H. A. Collier's riding was probably the feature of the day, for he won every race in which he entered—five in all.

S. F. Garrett (3½ h.p. Regal-Green) winner of the single-cylinder sidecar event.

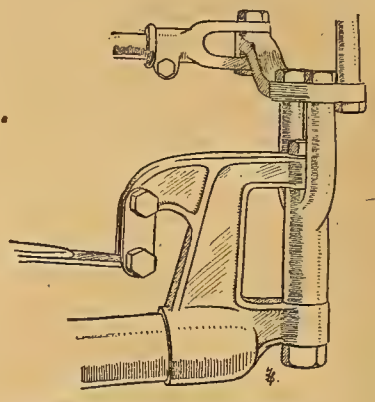
A NOVEL CYCLE CAR.

THE 8 h.p. NORTON WITH TWO SIDECAR BODIES.

ONE of the most ingenious light four-wheelers we have ever seen appeared in the Midlands last week and attracted a considerable amount of attention. On enquiries it turned out to be an experimental model constructed by Mr. Tom Norton, of Llandrindod Wells. On the model we inspected, the power unit consisted of an 8 h.p. twin Precision, transmitting power through a Roc two-speed (giving a 40% reduction) and reverse gear box enclosed in an aluminium box, thence through a propeller-shaft to the differential on a live rear axle. The whole was mounted on a strong tubular frame and carried by a single cross spring in front and a pair of quarter eliptic springs behind. The steering is Ackerman type and effected by a wheel geared down to the main column in a similar manner to that employed on the Ford. From the foot of the column the steering is direct. All four wheels are fitted with wooden rims, and the passengers are protected from mud by wide guards fitted with sensible side wings. The front guards are so mounted as to swivel with the wheels on turning corners. The body is extremely curious, and consists of two coach built sidecar bodies mounted side by side. Between them lie a side brake lever, which is of the usual motor cycle V rim type, and a lubricating tank. The petrol is carried in a tank under the front of the passengers' seat and supplies the fuel by gravity. Behind the body is mounted a large box which contains a generator, accumulators (for tail light), and provides ample accommodation for tools and spares, while the outside serves as a number-plate. Further details are as follows: Amac carburetter (two lever), wheelbase 6ft. 6in., track 3ft. 10½in., full length 9ft., full width 4ft. 6in., weight 6 cwt. all on and filled up with petrol and oil, tyres 650×65 mm., capacity of tank 4½ gallons. When the arrangements are complete a large number of these cars will be manufactured.

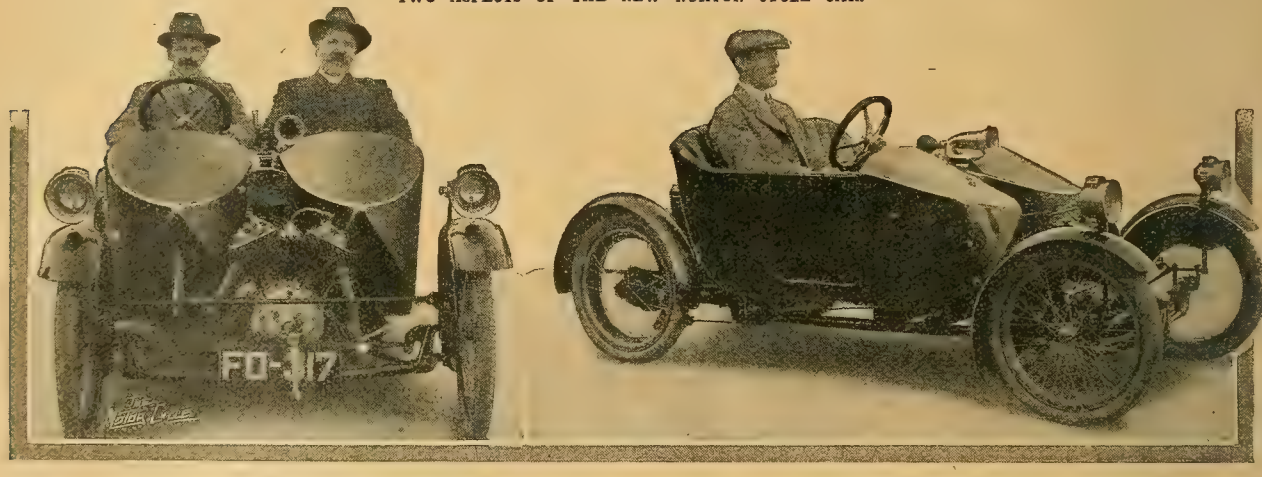


Specially wide dome mudguards and wooden rims.



Steering head and spring attachment on the Norton cycle car.

TWO ASPECTS OF THE NEW NORTON CYCLE CAR.



Front view showing engine and the two sidecar bodies.

Broadside view.

T.T. EFFECT ON TOURING OUTLINE.

The influence of racing is seen in many ways beyond the question of engine design being affected. One of the most notable departures from long accepted ideas is to be seen in the gradual disappearance of the old-fashioned up-swept and back-swept handle-bars, giving "an easy and graceful riding position," as the catalogues used to put it so nicely. As a matter of fact, they did give neither, and it was very noticeable last year in the Six Days' Trials to see the large numbers of riders, both private and trade, whose machines were fitted with handle-bars of a wide and almost flat pattern.

The hardened tourist and long distance rider will know that this is the most useful and comfortable design, and there is more than mere speed in the T.T. models listed by so many makers that is attractive. There is also a deal of comfort for long distance work. The exact width and height of such bars is a matter for the rider, but, generally speaking, about 24in. wide and the grips an inch or two higher than the peak of the saddle is a good average position.

RESULTS OF SCOTTISH EVENTS.

Glasgow M.C.C. Open Twelve Hours' Trial.

The results of the reliability trial are as follows: Rudge-Whitworth cup for best performance on solo machines, W. Hood (3½ Rudge-multi); 2, D. S. Baddeley (3½ P. and M.); Indian medal for the best performance of a passenger machine, Geo. Thomson (6 A.J.S. sc.); Gow cup, trade rider putting up the best performance, W. Deans (5-6 Hazlewood).

South Ayrshire M.C.C.

A reliability trial of 300 miles was held last week, the route being as follows: Maybole, Girvan, Stranraer, Creetown, Castle Douglas, and home *viâ* Dumfries. Five competitors completed the course to schedule, securing gold medals. They were A. Reeve (3½ Triumph), Richard Kennedy (3½ Bradbury), J. Riddel (3½ Zenith), J. Tweedie (3½ P. and M.), and T. Hunter (3½ Triumph).

N.E.A.A. Hill-climb at Legs Cross.

The motor cycle section of the N.E.A.A. held a hill-climb on Saturday at Legs Cross, a section of the Great North Road between Piercebridge and West Auckland. This hill, which is three-quarters of a mile long, has an exceptionally good surface and an average gradient of about 1 in 7 to 8, and being absolutely straight, is well adapted for a venue for climbs.

The event had been advertised as an open one, but owing to the counter attractions on Saturday such a poor outside entry had been obtained that the open classes were abandoned, and an event open only to the ten clubs contained in the association held. This made the number of the entrants sixty-five, and is a record for an association event. The proceedings were most successful, there being a good number of spectators and no accidents. There were no long waits, and the results were available shortly after the events were run off, which reflects great credit on the various officials concerned.

Class 1 was won by Norman Toovey, riding Hugh Mason's 2¾ Nut-Jap, R. Scoon on a similar machine being second. In Class 2 F. Turvey, jun. (3½ B.S.A.) made the best figure of merit during the afternoon, and the fastest time was put up by C. W. Smith (5-6 Bat), who also won the class for passenger machines. The following is a complete list of results :

A. N. Toovey (winner of Class 1) starting. He rode the 2¾ h.p. Nut-Jap on which Hugh Mason won the Junior T.T. Race.

CLASS 1.—Up to 350 c.c.

		Fig. of merit.
1.	A. N. Toovey (2¾ Nut-Jap)	174
2.	R. Scoon (2¾ Nut-Jap)	202
3.	A. E. Townsend (2¾ Douglas)	223

CLASS 2.—Singles over 350 c.c.

1.	F. Turvey, jun. (3½ B.S.A.)	170
2.	F. C. Wake (3½ Rudge)	191
3.	C. Bone (3½ Smith-Precision)	206

CLASS 3.—Twins.

1. R. J. Spencer (3½ Matchless-Jap).
2. A. N. Toovey (2¾ Nut-Jap).
3. R. Scoon (2¾ Nut-Jap).

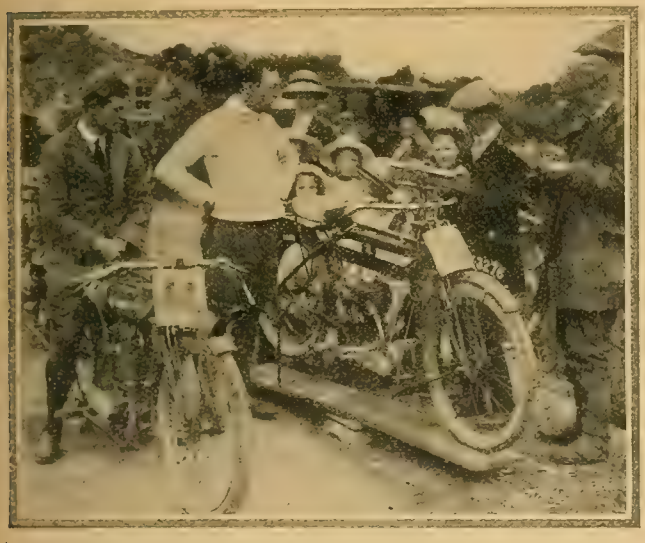
CLASS 4.—Any machine, time only.

1.	C. W. Smith (5-6 Bat)	38 3/5s.*
2.	F. Dixon (7 Indian)	39 2/5s.
3.	H. N. Hull (8 Matchless)	40 2/5s.

*Fastest time of day.

CLASS 5.—Passenger machines.

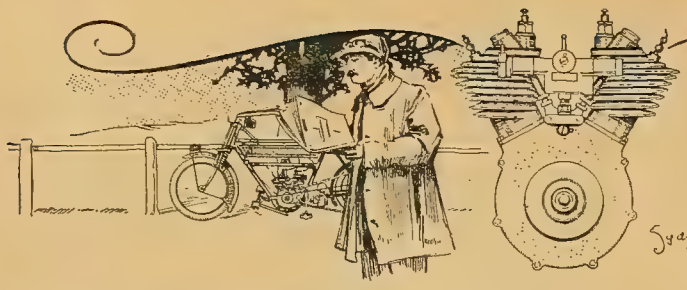
C. W. Smith (5-6 Bat-Jap).
Z. P. Forster (5-6 Bat-Jap).



NORTH-EASTERN A.A. HILL-CLIMB.

F. Turvey (B.S.A.) and Rowley (Rex-Jap) weighing-in after the finish. Turvey won Class 2.

AT THE FINISHING POINT. F. C. Topham (8 h.p. Dot-Jap sidecar), winner of the class for standard touring passenger machines.



SCOTTISH SIX DAYS' TRIAL.

LIST OF ENTRIES AND OFFICIAL NUMBERS.

The following are the entries received for the Scottish Six Days' Trials, July 21st to 26th :

1. C. W. Meredith (3½ Bradbury)
2. W. Westwood (3½ Triumph)
3. Hal Harrison (3½ Swift)
4. N. W. Downie (3½ Lea-Francis)
5. J. E. Chisholm (3½ Ariel)
6. S. J. K. Thomson (7-8 Bat sc.)
7. R. S. Morrison (5-6 Bat)
8. J. Chater-Lea, jun. (8 Chater-Lea sc.)
9. A. F. Downie (6 A.J.S. sc.)
10. G. L. Fletcher (2¾ Douglas)
11. S. T. Tessier (5-6 Bat)
12. C. H. Ingall (3½ Lea-Francis)
14. D. H. Noble (3½ Rover)
15. Hugh Gibson (3½ Bradbury sc.)
16. A. U. R. Downie (2¾ A.J.S.)
17. J. F. Morrison (2¾ Douglas)
18. G. Featherstonhaugh (3½ Rover)
19. J. H. Begg (3½ Rudge)
20. E. A. Colliver (7 Indian)
21. E. B. Keiller (3½ Rudge)
22. C. M. Keiller (9.2 G.W.K. c.c.)
23. Victor Wilberforce (9.2. G.W.K. c.c.)
24. C. T. Newsome (3½ Rover)
25. Mrs. Baxter (6 Rex)
26. J. T. Wood (9.2. G.W.K. c.c.)
27. A. W. Brittain (3½ Bradbury)
28. W. Pratt (3½ P. and M.)
29. T. A. McCreadie (2¾ Sunbeam)
30. E. F. Baxter (6 Rex)
31. K. A. MacDonald (3½ Singer)
32. G. E. Cuffe (3½ Premier)
33. W. B. Gibb (2¾ Douglas)
34. C. D. Wright (3½ Humber)
35. G. I. Francis (3½ Lea-Francis)
36. Rev. R. M. Bankes-Jones (3½ P. and M.)
37. R. Holloway (7 Premier sc.)
38. H. W. Hands (8 Williamson sc.)
39. G. C. Proctor (8 New Imperial sc.)
40. A. B Wade (8 New Imperial sc.)
41. L. E. Cass (6 Trump-Jap)
42. E. H Littledale (3½ Ariel)
43. R. M Stallebrass (6½ N.S.U sc.)
44. R. S. Macrae (3½ L.M.C.)
45. R. Pearson (5-6 Clyno sc.)
46. C. Freeman (5-6 Clyno sc.)
47. F. L. Bassett (2¾ Sun Villiers)
48. G. Brough (6 Brough)
49. — Boddington
50. J. Cocker (3½ Singer)
51. G. A. Gregson (5-6 Bat)
52. A. W. Walden (3½ Premier)
53. J. G. Beveridge (3½ Rudge)
54. Humber, Ltd. (3½ Humber)
55. F. C. North (3½ Ariel)
56. T. T. Laker (3¾ Elswick
57. V. Bushy (3½ Ariel)
58. H. Thompson (3½ Kynoch)
59. G. Nott (5-6 Clyno sc.)
60. W. Cramb (3¾ Elswick)
61. D. Bell (6 A.J.S. sc.)
62. J. B. Robertson (2¾ Douglas)
63. B. A. Hill (7 Indian)
64. A. D. Scott (3½ Triumph)
65. Mrs. Hardee (3½ P and M.)
66. J. R. Blackburn (8 Morgan c.c.)
67. N. A. Ayres (2¾ Sun Villiers)
68. Gordon Armstrong (Gordon c.c.)
69. A. G. Fenn (3½ B.S.A.)
70. D. Alexander (8 Williamson sc.)
71. G. T. Gray (5 Rudge)
72. W. J. K. Gulland (3½ B.S.A.)
73. J. Donaldson
74. J. Oliphant (3½ Premier)
75. J. R. Alexander (7 Indian)
76. A. G. Cocks (2½ Connaught)
77. C. Q. Roberts (6 Zenith)
78. J. A. Hoult (3½ Matchless)
79. A. J. Dixon (3½ Singer)
80. L. Sealey (3½ B.S.A.)
81. E. M. Oliver (5-6 Hazlewood)
82. T. Pollock (3½ James sc.)
83. F. G. Edmond (2¾ Humber)
84. H. M. Jameson (3 Royal Enfield)
85. G. Taylor (3½ Rudge)
86. J. F. Selous Jones (2¾ Douglas)
87. G. Wray (5-6 Clyno sc.)
88. T. Finlay (3½ James sc.)
89. R. G. Mundy (——)
90. W. C. Brandauer (7-9 Indian)
91. P. D. Walker (10 Summers and Harding c.c.)
92. F. Smith (5-6 Clyno sc.)
93. S. Tubb (3½ Humber)
94. L. Newey (3½ Ariel)
95. J. Steel (3½ B.S.A.)
96. Miss R. Hammett (2¾ Douglas)
97. R. E. Guest (7-8 Matchless sc.)
98. Miss Reid (3½ Brough)
99. S. Wright (8 Humberette c.c.)
100. C. R. Collier (7-8 Matchless sc.)
101. T. Knowles (2¾ Humber)
102. T. Silver (3½ Quadrant)
103. R. G. MacGibbon (3½ Edmund)

A few late entries have been received since the ballot for numbers took place.

Nottingham and District M.C.C. reliability trial. Scene at the start from Trent side on Saturday.

Club News

South Birmingham M.C.C.

The results of the paperchase held on the 5th inst. are as follows: 1, J. Huntington (3½ Triumph); 2, J. Percox (3½ Alldays); 3, J. J. Woodgate (3½ Singer). The hares were given an hour's start, and laid a trail of forty miles. The winner reached the finishing point twenty-five minutes after the arrival of the hares.

Cork and District M.C.C.

An afternoon trial over a secret course was held on the 2nd inst. Result:

Solo Class.—1, J. Atkinson (Rudge); 2, R. Atkinson (Triumph); 3, M. English (2¾ Humber) and E. B. Russell (Triumph) tied.

Passenger Class.—1, H. C. Johnson (Indian); 2, John Healy (Enfield); 3, Wm. Sheely (Bradbury).

Essex M.C.

The gymkhana organised by this club jointly with the Walthamstow M.C. was held on the 5th inst. A new event was a hockey race. Each competitor was provided with a hockey stick, and had to drive his ball from the starting line to the goal posts over a course of about 150 yards. Competitors were allowed to turn about as they pleased, so long as their feet did not touch the ground. As the course was only about thirty feet wide, this turning was productive of many hairbreadth escapes.

The meeting was held at High Beech, near Loughton.

Belfast v. Dublin.

The results of the inter-city reliability trial between the Southern and Ulster Centres of the Motor Cycle Union of Ireland, which was held on the 28th ult., were announced last week. The contest was decided on the best six scores on each side, and as the Dublin men were found to have eight men with maximum marks (100) they secured an easy victory. The markings were as follows: G. Roche (3½ Rover), 100 marks; T. D. Weir (7 Indian), 100; R. McDonnell (2¾ Douglas), 100; T. E. Greene (3½ Rudge), 100; P. H. Hurse (3½ Calthorpe), 100; J. Browne (2¾ Douglas), 100; J. Doleman (2¾ Douglas), 100; W. J. Henderson (3½ Rudge), 100.

The best markings in the Belfast team were: W. J. Chambers (3½ B.S.A.), 100 marks; A. Cann (3½ Ariel), 99; J. Lavery (3½ Ariel), 99; J. Stewart (2¾ Douglas), 99; S. P. Corry (3½ B.S.A.), 98.

Portadown and District M.C.C.

An open hill-climb in conjunction with a couple of confined events was held on the 3rd inst. at Rathfriland, Co. Down. The local people put up a trophy for the open event, known as the Rathfriland Cup, which was won by J. Jones (3½ B.S.A.) It has to be won twice before becoming the property of the winner. Results:

Sidecar Class.—1, Hewitt (6 Enfield), 3s.; 2, Paul (6 Enfield) 3s.; 3, Kearney (5-6 Rudge), scratch.

Club Class.—1, Boyd (3½ B.S.A.), 7s.; 2, Wilson (3½ Triumph) 8s.; 3, Stevenson (6 Rex), 6s.

Open Class.—1, James (3½ B.S.A.), 4s.; 2, Boyd (3½ B.S.A.), 8s.; 3, Parker (3½ Rudge), 1s.

Doncaster A.C. (Motor Cycle Section).

The second competition in the President's Cup trials took the form of a reliability run to Nottingham and back. There was a good turn out. Result: 1, Goult, sec. (Rudge) and Ablett (Rudge) losing no marks. Dunston (Rudge) and Smith (Bradbury) also tied with a loss of one point each.

Malvern and District M.C.C.

A speed trial was held on the 28th ult. at Madresfield Court (by kind permission of Lord Beauchamp) on the private drive. The distance was half a mile with quarter of a mile for flying start and three-quarters of a mile to finish in. All the classes were well filled with the exception of the 350 c.c. class. H. F. S. Morgan was driving his Grand Prix model, and there were some good times put up.

Class I.—Up to 350 c.c. on time, distance half a mile.

1. E. C. Heis (2¾ Douglas) 34
2. J. H. Marsden (2¾ Douglas) 39

Class II.—500 c.c on time, T.T. machines.

1. R. E. Surman (3½ Alldays) 28
2. W. Walker (3½ Triumph) 28 2/5
   F. W. Giles (3½ Triumph) 28 2/5

Class III.—Touring machines up to 500 c.c. on time.

1. H. W. Wynn (3½ Rudge) 31 2/5
2. R. Ravenhill (3½ Rover) 32
   B. Bladder (3½ Rudge-multi) 32

Class IV.—Up to 1,000 c.c. on formula.

		Time.	Fig. of merit.
1.	T. B. G. Vale (3½ Rover) ...	27 ...	895
2.	W. R. Jones (3½ Ixion) ...	27 1/5 ...	980
3.	R. E. Surman (3½ Alldays) ...	28 1/5 ...	1,043

Class IV.—Fastest time.

1. *H. J. L. Greatwick (6 Wright-Blumfield) ... 26
2. T. B. G. Vale (3½ Rover) 27
3. J. Pennington (5 Bat) 27

*Fastest time of the day.

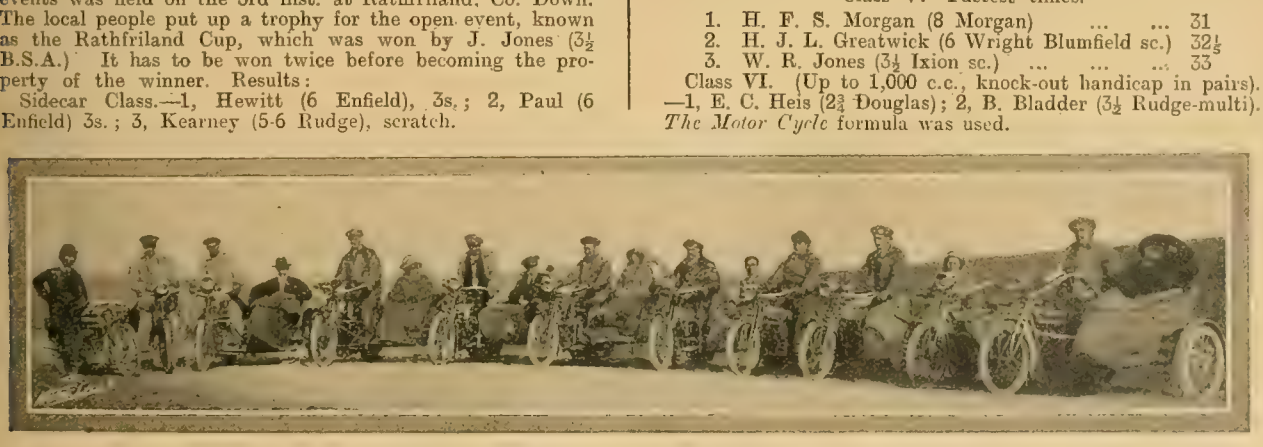
Class V.—Sidecars and cycle cars up to 1,100 c.c. on formula.

1. W. R. Jones (3½ Ixion sc.) ... 33 ... 958
2. H. F. S. Morgan (8 Morgan) 31 ... 977
3. F. Leeke (6 Enfield sc.) ... 33 ... 1,101

Class V.—Fastest times.

1. H. F. S. Morgan (8 Morgan) 31
2. H. J. L. Greatwick (6 Wright Blumfield sc.) 32 1/5
3. W. R. Jones (3½ Ixion sc.) 33

Class VI. (Up to 1,000 c.c., knock-out handicap in pairs).—1, E. C. Heis (2¾ Douglas); 2, B. Bladder (3½ Rudge-multi). *The Motor Cycle* formula was used.



Group of competitors in the Plymouth and District M.C.C. Hill-climb at Moorshap Hill, Tavistock.

Club News.—

Wolverhampton M.C.C.

The Stevens cup trial to Barmouth took place at the end of last month. Result: 1, W. H. Bishop (3½ T.T. Rudge), cup and medal; 2, S. F. Murrell (6 Bat sc.); 3, E. T. Hart (2¾ h.p. A.J.S.). Amateur prize other than prize winners, R. Tonks (2¾ A.J.S.).

Westmorland M.C.C.

A petrol consumption trial took place on the 26th ult. over a fairly stiff course about thirty miles long. Results: 1, H. L. Mason (3½ Bradbury), 38.5; 2, N. Abbat (3½ Rover), 36.2; 3, J. Braithwaite (3½ Braithwaite), 36.1. R. M. Chaplow on a lightweight Humber consumed the least petrol and averaged nearly 200 miles per gallon.

North Birmingham A.C.

A club hill-climb was held at Hipton Hill, near Evesham, on the 28th ult. Results:

	Rider and machine.	Time.	Formula.
1.	N. Fairley (2½ Ivy-Precision) ...	26⅖s.	5,366
2.	H. Newey (2¾ Levis)	19⅖s.	5,689
3.	H. J. Moseley (2¼ Levis) ..	31⅘s.	6,305
4.	W. Britton (3½ T.T. Triumph) ..	20⅕s.	6,312
5.	R. Lovegrove (3½ T.T. Singer) ...	20s.	6,336
6.	H. Fairley (3½ T.T. Rover)	19⅕s.	6,517

There will be a flexibility hill-climb on the 12th inst.

Essex M.C.

The hill-climb for members only was held at Lippitt's Hill, near High Beech, on the 21st ult. Results:

Class I. (any single-cylinder solo machine).—1, L. G. Brown (Corah-Jap); 2, J. A. Campbell (Regal-Green).

Class II. (any multi-cylinder solo machine).—1, G. L. Fletcher (Douglas); 2, Miss Hammett (Douglas).

Class III. (solo machines up to 350 c.c.).—1, G. L. Fletcher (Douglas).

Class IV. (passenger machines).—1, Ray Abbott (Bradbury sc.); 2, G. Griffith (Zenith sc.).

Fastest time of the day.—G. Griffith (Zenith).

Streatham and District M.C.C.

The committee have awarded silver medals to the following members who made non-stops in the recent M.C.C. Inter-team Trials: R. G. Mundy, S. T. Tessier, F. L. Bassett, J. C. Bateson, and C. F. Halsall.

The next members' competition is a night trial on the 12th inst., the premier award being a cup presented by Messrs. Dobson. The course of 120 miles consists chiefly of main roads with six observed hills, and an average of twenty miles an hour must be maintained over each of the two observed sections from 9.30 p.m. to 12.30 a.m., and from 2 a.m. to 5 a.m. Watches and speedometers are barred.

The club's annual open hill-climb will be held on 30th August.

Hertfordshire M.C.C.

In Division A, Class III., of the speed trials recently held in Luton Hoo Park, the second man should be G. W. Miller (3½ Grandex).

Taunton and District M.C.C.

A non-stop run was held from Williton to the top of Porlock Hill on the 21st ult. The medal was won by C. Forrest (2¾ Douglas).

The Motor Cycling Club.

A slow and fast hill-climb, together with a restarting test incorporated in the one ascent, will be held on July 19th. This event will be run on the principle of one rider one machine, as such an event gives the ordinary private owner a fair chance. An endeavour has been made to arrange for the use of a hill within twenty miles of London.

Public Schools M.C.

Owing to the absence of so many members in the Isle of Man for the Tourist Trophy Races, the general meeting and first annual dinner, arranged for May 30th, was postponed, and will now take place at the Grand Hotel, Birmingham, at 7.30 p.m. on the 12th inst. Those wishing to attend at the dinner are requested to advise the hon. sec. (Mr. A. M. C. Scott) Public Schools Motor Club, Grand Hotel, Birmingham, not later than the 9th inst.

Barton-on-Humber and District M.C.C.

A hill-climb was held at West Halton on the 21st ult. Results:

Class I.—Lightweights, on formula.

1.	John H. Furniss (2½ Elswick)	45.2
2.	O. Atkinson (2¾ Elswick)	57.03
3.	G. W. Drury (2¾ Elswick)	64.82

Class II.—Touring machines, on formula.

1.	T. T. Laker (3¾ Elswick)	30.0
2.	F. Hopper, jun. (3½ Torpedo)	34.08
3.	A. Smith (3½ Triumph)	44.93

Class III.—Passenger machines, on formula.

1.	F. Hopper, jun. (3½ Torpedo)	29.94
2.	W. E. Slack (3¾ Elswick)	39.55
3.	W. G. Cordock (6 Clyno)	44.87

Class IV.—T.T. machines, on time.

1.	Frank G. Howard (3½ B.S.A.)	24s.
2.	O. Spavin (3½ B.S.A.)	25s.
3.	F. Hopper, junr. (3½ Torpedo)	25⅕s.

Class V.—Unlimited, on time.

1.	F. Hopper, junr. (3½ Torpedo)	24⅕s.
2.	O. Spavin (3½ B.S.A.)	25s.
3.	Frank G. Howard (3½ B.S.A.)	25⅕s.

Fastest time of day, made by Frank G. Howard (3½ B.S.A.), 24s.

SECOND-HAND - MACHINES -

are a good guide to the value of the new. Look in the Sales Columns and note the good prices asked for a Second-hand MATCHLESS, and note also how few, comparatively, there are for sale. There is a wealth of reason in this.

Let us send you Catalogue with address of nearest Agent where models can be seen.

H. COLLIER & SONS, Ltd., PLUMSTEAD, LONDON.

LUKIN

Single Control Carburetter

"For Big Twins"

Gentlemen,

After careful testing and fitting I have got the most excellent results out of your carburetter, and have decided to keep it. Its great merit seems to be that it gives nice, even, quiet running with great power when required. Most of the modern carburetters have the power, but very often accompanied by such an "angry" pick up that it is torture to use them on a powerful twin, at any rate for long distances. To anybody who likes a powerful engine combined with comfort, I think the LUKIN is a real "Godsend."

Riders of high-powered twins cannot follow a wiser course than fit the Lukin carburetter. It completely transforms the running of the engine and entirely eliminates the drawbacks of the old double control system.

It imparts the flexibility of a Car to a Motor Cycle.

Apply to your local agent for particulars, or write to :—

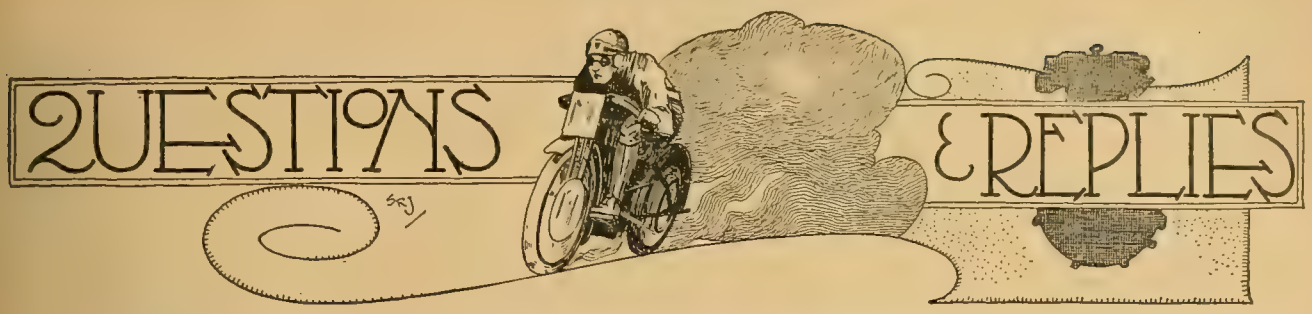
In answering this advertisement it is desirable to mention "The Motor Cycle."



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Swindon to Norwich.

Will you please tell me the best route between Swindon (Wilts.) and Norwich?—F.M.

Your best route would be as follows: Swindon, Faringdon, Oxford, Bicester, Buckingham, Newport Pagnell, Bedford, Cambridge, Newmarket, Thetford, Attleborough, Wymondham, to Norwich.

Removing Pulley; Clutch Slip.

My machine is a 2¾ h.p Humber with Armstrong three-speed gear. (1.) On taking down my engine, I found it quite impossible to remove the pulley off the shaft, though I tried soaking it with paraffin and forcing it off with three wooden wedges. What would you suggest as the best means of removing the pulley? (2.) What is the best remedy for a slipping clutch? It suddenly started slipping the other day; in fact, so badly that it would not turn the engine round with the exhaust valves raised. What would you suggest as the cause?—C.P.M.

(1.) We should advise you to use a special pulley extractor. This will remove the pulley without any risk of damaging the shaft. (2.) Possibly the clutch requires to be cleaned out. You might wash it out with paraffin and then inject thin clutch oil. If no improvement an adjustment is obviously required.

Power without Speed.

I have a 1912 2¾ h.p. Enfield machine, fitted with Amac carburetter with 24 jet. On the level I cannot obtain a speed of more than 30 m.p.h., yet it will take me up quite considerable inclines at this pace on top gear. Compression is good, and, as far as I can see, there is nothing wrong, as I have thoroughly overhauled the engine, ground in valves, removed carbon deposit, etc. (1.) To what do you attribute this failure to attain speed? (2.) Would a smaller jet be better?—M.V.L.

(1.) There cannot be much the matter with your machine if it will take quite considerable inclines at thirty miles an hour. To obtain more speed on the level we should advise you to time the spark a little faster. (2.) A smaller jet will not give greater speed, but a larger one with an increased air supply might do so. The 24 jet you are using is about right for ordinary riding.

The Power of Water-cooled Engines.

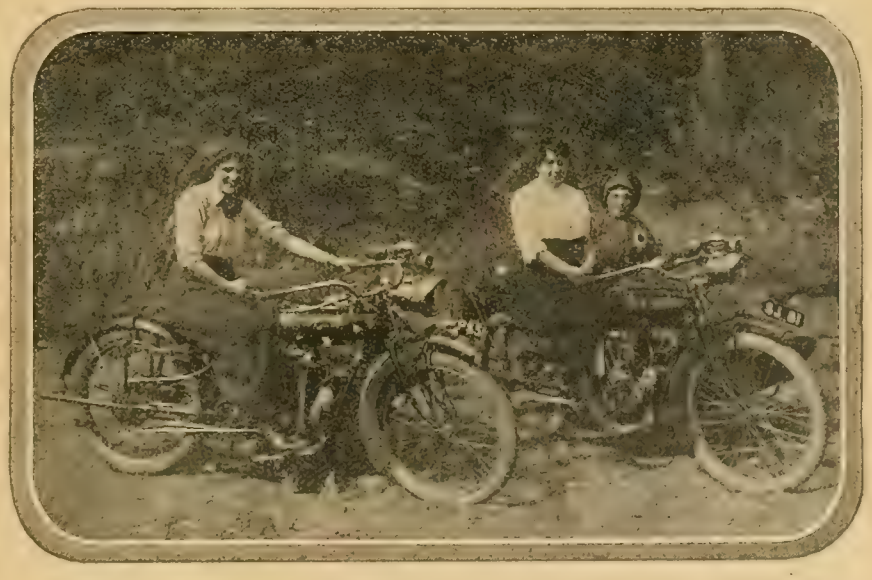
Will you kindly tell me—(1.) Whether I might expect to obtain much more power from a 3½ h.p. Zenith-Green than from a 3½ h.p. Zenith-Jap for solo riding? (2.) The advantages and disadvantages of overhead valves as compared with side by side valves? (3.) Whether a Zenith-Green would be likely to be more expensive to run? (4.) Whether any Zenith-Greens have performed in big reliability and speed trials and hill-climbs, and, if so, with what results? (5.) Does the water-cooled engine with overhead valves require much more attention and care, and is it less trouble to keep clean?—C.R.F.

(1.) You should obtain slightly more power from a water-cooled engine, especially on long runs. (2.) Overhead valves are thought to be slightly more efficient, but they render the engine less compact, and if the valve head breaks off and falls into the cylinder it may cause serious damage. This, however, is a fairly rare occurrence. (3.) The Zenith-Green should not be more expensive to run than an air-cooled engine. (4.) The Zenith-Greens have performed well, and at present hold the hour and other records for sidecars. (5.) There is certainly a little more to look after, but, on the other hand, it is not so frequently necessary to take off the cylinder to clean out the carbon. Altogether it is a matter of personal choice.

Wear of Exhaust Cam.

(1.) I ride a 3½ h.p. two-speed machine. I have removed the carbon deposit from the piston and cylinder, and yet I find that the engine overheats after running five or six miles. I use a .031 jet in a B. and B. carburetter. (2.) Please tell me how to clean and dress a Whittle belt.—A.S.

(1.) It is quite possible that the exhaust valve cam is worn, and this prevents the valve from lifting properly. Also see that the valve spring is sufficiently strong. Either a weak spring or a valve which did not lift properly would cause overheating. (2.) With regard to your belt, you have to scrape each link separately with a knife and dress it with one of the well-known belt dressings, obtainable from any motor cycle dealer.



LADIES AND THE MOTOR CYCLE.

Miss Lottie Berend, who has now become a rider of a 7 h.p. Indian sidecar. Mrs. W. H. Wells is the lady seated on the 3½ h.p. sidecar machine of the same make.

Stiff Engine.

I bought some time ago a second-hand (nearly unused) N.S.U., 5½ h.p., 1911, m.o.i.v., one lever controlled carburetter. When riding with sidecar (I never ride solo) the engine often sticks, and the front cylinder seems to overheat very much. I cleaned the piston and cylinder, examined the timing of both inlet and exhaust, set the magneto, and tried the sliding of the piston into the cylinder; the cylinder wall is bright and polished, the rings are perfect, compression fairly good cold and warm, valve springs are new —all seems in good order. I must say also that when the engine sticks the belt slips over the motor pulley, but the engine revolves again immediately. Sometimes that sticking occurs three or four times in succession, and then during five kilometres it runs perfectly. I supposed it was pre-ignition due to carbon deposit, but after cleaning it is the same. I tried different kinds of oil and petrol, always with the same result. Where is the fault?—A.S. (Brussels).

It is very difficult indeed to diagnose your trouble without a personal examination of the engine, but we should be inclined to think that there is a tightness somewhere, most probably in the piston or piston rings. When you next remove the cylinder, we should advise you to examine the rings and piston very carefully, to see if there is any bright part at any point which shows undue friction. This bright portion should then be slightly reduced by emery-clothing it down. It is also possible that you may not give the engine sufficient oil, and we should certainly advise you whenever you feel it sticking in the way you suggest, to inject an extra supply.

Anchor Plates for Hub Gears.

I purchased this year a new 3½ h.p. motor cycle fitted with Armstrong Mark VI. gear, which has given considerable trouble through the axle revolving. Eventually the ends fitted by the builders of the cycle broke away at the lugs under the strain. I have had new and heavier ends fitted in which the spindle, although not revolving, moves backwards and forwards, probably to the extent of one-twelfth of an inch, and sufficiently to dislocate the gear and clutch. I am at a loss to know what to do. The nuts are properly secured. (1.) Is there any danger through riding the machine under the circumstances? (2.) How can I get the axle securely fixed? (3.) Is there any pattern of fork-ends made specially for these gears? (4.) Will the axle eventually wear its way round, seeing that it has forced a certain amount of play?—G.E.G.

(1.) The danger is that the fork-ends will open and allow the spindle to turn, when, of course, the gear is rendered useless on the lower speeds, or on any but the direct drive. (3.) You can only get the axle securely fixed by employing fork-ends of very substantial proportions with securing washers and nuts, on the lines of the New Hudson motor bicycle. (3.) Fork-ends such as you require can be obtained from Messrs. Chater-Lea, Ltd., Golden Lane, London, E.C. (4.) Yes, the axle, owing to severe strain, will eventually wear its way round and out at the fork-end. In other words, it will force the jaw open, unless the latter is sufficiently strong to resist. Another method of locking the axle, which you might try, is to have a stay made on the lines of those fitted to coaster brake hubs. This fits over a square on the axle, and is attached to the main stay of the motor cycle, some 6in. away from the fork-end. The Armstrong Three-speed Gear Co., Icknield Street, Birmingham, can supply these. They are called anchor plates.

Benzole.

Can you tell me how I could use benzole in my machine, a 2¾ h.p. Minerva with Minerva carburetter? I tried benzole a few days back without success. I then warmed the engine up on petrol; this time it fired fairly well, but knocked like a riveting machine and would not climb over a shadow on the road.—ENQUIRER.

There is no reason why you should not use benzole, as your machine does not differ from others in its construction. We should be inclined to think that you are obtaining a rather poor quality of benzole, as most readers seem to get good results from it. Probably you will find that the float will want weighting a little, and the extra air inlet may possibly require to be enlarged. Beyond that, there is nothing else you can do to make the machine more suitable for benzole.

EXPERIENCES WANTED.

"F.W.C." (Sydenham).—A.C. Sociable; reliability, consumption, hill-climbing, gear, starting, and tyre wear.

"W.E.K." (Broughton).—Wall tri-carriage.

"D.G." (Kimberley).—8 h.p. air or water-cooled for heavy sidecar work; wear of cylinders, valves, and general reliability.

"F.F.L." (London).—Folding or collapsible sidecars.

"C.W.T.L." (North China).—4 h.p. Norton, 4-5 h.p. Excelsior, and 2¾ h.p. Douglas. With and without sidecars.

"J.M." (Ealing).—2¼ h.p. F.N., shaft drive, two-speed. Average speed, hill-climbing, consumption, general comfort.

A few o. the competitors in the Enfield Reliability Trial in Yorkshire at the Aysgarth control. (See page 886.)

STRENUOUS WORK —

as opposed to "sprint" records, can only be accomplished by a machine in which every part has been carefully designed and constructed to stand maximum stresses for long periods. The **still unbeaten record** standing to the credit of the

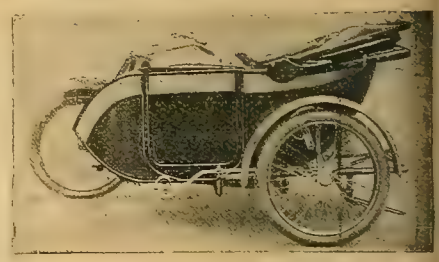
THE PORTLAND SIDECAR



Send for descriptive Catalogue.
Fuller specifications of any or all machines upon request to—

Maude's Motor Mart

136, Great Portland Street,

LONDON, W.

'Grams—"Abdicate, Wesdo, London."
'Phone—552, Mayfair.

Whatever the SPEED

—whatever the road conditions, whatever the strain imposed—"The DRUID" never fails to *successfully* perform that special service for which it is made.

—Here's striking testimony to the STRENGTH and EFFICIENCY of this famous Spring Fork—note it now:—

JUNIOR T.T. RACE

(I.O.M., June 4-6, 1913).

The winning machine

—the 2¾ h.p. N.U.T. ridden by Hugh Mason—was

FITTED WITH "DRUID"

Spring Forks

—indisputable proof of the "DRUIDS" supremacy!

—See that *your* mount is 'DRUID-equipped' —*this* Fork eliminates all vibration, bouncing and road shock.

Write for "DRUID" Booklet describing.

A DREW & Co., Coventure Street, BIRMINGHAM

Supreme for Solo and Sidecar machines.

Competitions in Beauty Spots.

IN this issue we publish a correspondent's letter resenting the holding of the A.C.U. Six Days' Trials in the Lake District this year. The writer bases his complaint solely on the grounds that the Lake District is one of exceptional beauty, and that the presence of so many motor cycles will tend to disfigure the landscape and to upset the hitherto hallowed calm of Wordsworth's country.

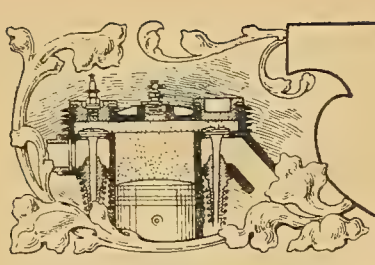
On the question of a motor cycle as an æsthetic object we decline to be drawn, we prefer to leave such a theme to other minds; but we do not think any unbiased person can truthfully call the modern machine ugly or offensive to the eye. Our correspondent evidently thinks a great rattle and smoke will be created, but as regards the former he would be well advised to keep up to date, as he says he is a motor cyclist himself, and recall the fact that efficient silencers are now compulsory by law, and the local police have power to stop any rider who, in their opinion, is not complying with the law. Smoky exhausts are only momentary on a motor cycle; if continued the sparking plug would soon cease to function properly.

While on the subject of appearance we would remind our correspondent that the A.C.U. has this year forbidden what may be termed "freak" dresses for the riders, or dresses which savour of advertisement of themselves or any goods. Furthermore, not more than three days out of the week will be spent among the Lakes, and as the passage of the competitors cannot cause inconvenience to any person for more than an hour or so at most, and as all the competitors return to Carlisle, which is not in the Lake District, every night, we think that alarm of even the most fastidious person that his peace will be disturbed is entirely unfounded.

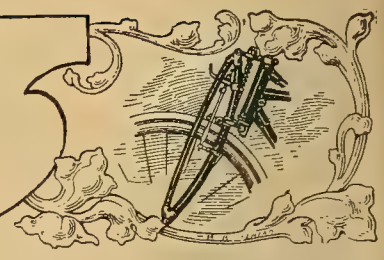
Our correspondent has also apparently fallen into the common error of imagining that a reliability trial is a race. Can we, once and for all, scotch this idea? A maximum speed of 20 m.p.h. is fixed by law and rigidly enforced by the A.C.U., and there is absolutely no need for excessive speed. It is a curious fact that many persons always imagine a race is in progress if they see a number of motor cyclists congregated together. One might as well argue that a regiment of soldiers marching through a village betokens that we are at war.

Twin-cylinder Engines.

THE modern tendency towards twin-cylinder engines gives rise to several interesting questions. Undoubtedly the small twin is more comfortable than a single cylinder of equal capacity, especially if the twin be of the horizontally opposed type. Against this must be set the slight extra complications and the small moving parts. As regards power and pace, there is little to choose between the two types. Until recently the greatest trouble with V twin-cylinder engines has been in connection with the big end bearings and valve gear. The first problem can be easily cured by better lubrication, but the second requires more thought. It can, however, be arranged satisfactorily, and on some few machines has been well carried out. Lubrication of the front cylinder has proved a stumbling block to many, but the trouble is easily solved by forced oil circulation. In the matter of lubrication there is still much to be learned, though twin-cylinder engines are not the only offenders in this respect. Besides the extra comfort, the multi-cylinder engine scores in acceleration, and consequently it is often more convenient in traffic. There seems to be a general impression that twins will not run slowly, and though this may be the case with a few under-flywheeled machines, it is quite a fallacy to imagine that slow running cannot be obtained, as we have seen two-cylinder engines running as slowly as any single. The increase in twins and multi-cylinder engines is a move in the right direction, for it will give us smoother running, greater flexibility, and greater silence, but lubrication must be attended to and noisy valve gear eliminated before the single can be ousted, while the inaccessibility of certain nuts should receive the attention of designers, for there is no need that the twin should be more inaccessible than the single, though it must, of course, be rather more trouble to dismantle. If there be a drawback to the horizontal type of engine, it lies in the direction of dismantling cylinders. The design of the engine necessitates a special type of frame, and it is a difficult matter to design it so that sufficient space is left for taking off the cylinders without removing the engine. Doubtless even this objection will be eliminated in the near future, for more than one designer is at work on engines of this type for motor cycle use, and when a multiplicity of designs of one type are on the market improvement is always very rapid.



SIMPLE TIPS FOR AMATEURS.



BY UBIQUE.

Taking Down an Engine.

THE hints given in the accompanying notes may be useful to such riders who are not accustomed to handling the inside of a motor cycle engine, and for that reason have qualms about stripping their engine for inspection or cleaning purposes.

The Importance of Method.

It is hoped that they may prove useful in saving time and preventing damage. The most important factor in saving time in doing work of this kind is to start methodically. The following order is that in which the writer almost invariably proceeds. A box, or boxes, should be at hand, into which all parts, nuts, bolts, etc., should be put directly they are removed from their places, and it is important to see that the boxes are empty in the first instance. There is in the writer's mind an instance of a novice who, after re-erecting his engine, found he had a few nuts and washers over. He promptly took his engine down again, and, with much difficulty, succeeded in making use of the remaining items, though they did not belong to the engine, and had been placed in the box by a jocular friend.

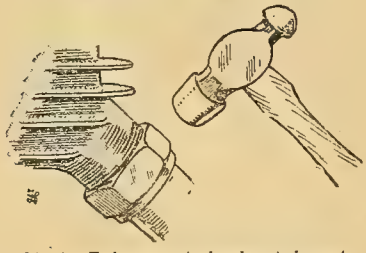


Fig. 1.—To loosen a stuck exhaust pipe nut.

First of all, detach the high-tension wire and sparking plug, then remove the petrol pipe, carburetter, and exhaust pipe. If the exhaust pipe nut will not turn it has probably rusted on, and the quickest method of removing it is to apply a mixture of petrol and lubricating oil to the thread and give the faces of the nut a few sharp taps with a hammer. Care must be taken to hit the face of the nut fairly so as to prevent damage, and the blows must not be heavy for fear the casting should be cracked. This treatment almost invariably succeeds after a very short time, though it is sometimes easier if the engine is still hot.

A Valve-removing Tip.

The next process is to remove the valves, as this operation is generally easier with the cylinder in position.

Should no special valve-removing tool be handy, the following tips will prove useful. Remove the valve cap and insert over the valve a wooden plug or piece of cycle tube cut to such a length that the cap may be replaced, and, through the plug, prevent the valve from rising. The spring collar may now be levered up and the cotter removed. A forked lever should be kept for this purpose, but a useful substitute is afforded by placing a nut or piece of wood on the timing case. Failing this, the spring may usually be raised with a screw-driver. If the cotter should be "burred," a most difficult and unpleasant job is necessary, for the spring must be raised and the cotter filed down till it can be withdrawn.

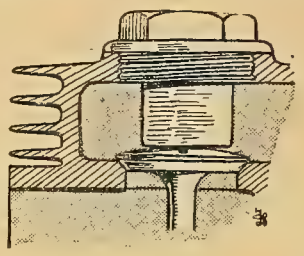

Fig. 2.—A method of holding down valve with wood block while removing a stubborn valve cotter.

Awkwardly-placed Nuts.

After both valves have been removed the holding down bolts of the cylinder may be taken off. These are often inaccessible, and, on many engines, only a very small movement of the spanner is possible, so that before replacing these nuts a few alterations should be made. Where there is no space between the cylinder and the nut, the nut should be filed down or smaller nuts obtained with a similar thread. A short box spanner should be made, or obtained, to suit these nuts, and with these slight alterations the work will be considerably simplified for future occasions. Sometimes the corners of the nuts catch the radius on the bottom of the cylinder, and in such cases a shaped washer should be used (as shown in sketch). It must not be imagined that all engines suffer from the above defects, but in many cases inaccessibility is an all-too-common feature.

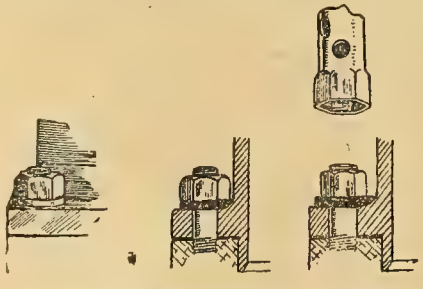

Fig. 3.—Cylinder holding down bolts. Showing use of shaped washer and special nut to permit of the use of a box spanner.

Removing the Cylinder.

When the nuts have all been removed the cylinder may be lifted off. It may be stuck to the crank case, in which event a blow with the palm of the hand will usually loosen it. As soon as the cylinder is slightly raised, the pulley should be turned till the piston is almost at the bottom of its stroke. The cylinder may then be tilted over and completely withdrawn.

As soon as the cylinder has been removed, the inside of the piston should be filled with clean rag, in such a way as to prevent it from being damaged by the connecting rod; also the top of the crank case should be covered to stop dirt or nuts from dropping inside.

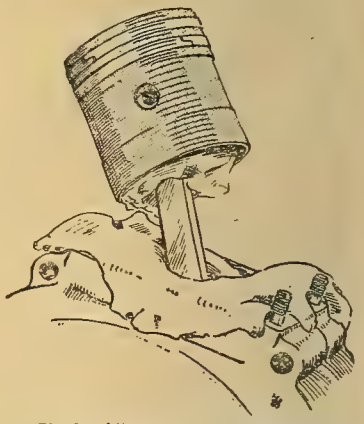

Fig. 4.—After removing cylinder fill the piston with rag to prevent damage, and cover the top of the crank case in order to exclude dust or dirt.

Cleaning.

The piston head may now be carefully scraped and cleaned, the surface of the head being polished as much as possible. If the piston rings do not move freely they must be removed and the carbon scraped from the grooves; if they are free and in good condition, they are best left alone, for they are easily broken.

Should it be necessary to remove the rings, a good method is to insert a single piece of stiff wire (a fine knitting needle suits the purpose admirably) behind the ring, and gradually to work it round. At the same time, the end first lifted should be kept slightly above the groove. This method is very simple, and if

Simple Tips for Amateurs.—carefully carried out will never cause breakage. Next the cylinder heads and valve ports should be carefully cleaned, and for this purpose a piece of ⅜in. bar, shaped like a chisel, is very useful. It should be of sufficient length to reach the bottom of the cylinder and still provide a comfortable grip. Care must

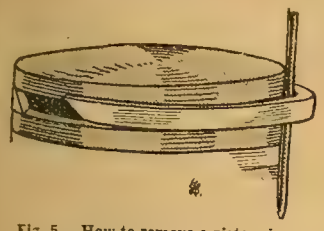

Fig. 5.—How to remove a piston ring with single wire.

be taken to remove the ring of carbon which sometimes forms on the cylinder walls just above the piston travel, as this is a common source of knocks.

Valve Grinding Hints.

After thoroughly scraping the cylinder head the valves may be ground in. This operation is simple, and too well known to require description, but the following tips may be found useful as time-savers.

Before grinding the exhaust valve use emery cloth to loosen the scale. For grinding purposes, use the best fine

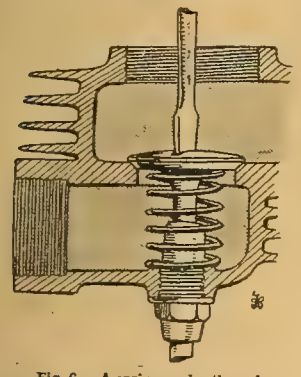

Fig. 6.—A spring under the valve head greatly facilitates valve grinding.

carborundum powder, and finish with flower of emery, or knife polish. Keep plenty of paraffin on the faces, and before starting to grind place a light spring under the valve head (see sketch), as after every two or three turns of the screwdriver this will automatically raise the valve and prevent ringing. A final polish can be given with knife powder and oil. One well-known rider even uses Globe polish.

If there are ridges formed on either valve face or seating, these should be machined off by the nearest person who knows how to use a lathe. Now thoroughly wash the cylinder with petrol or paraffin, and wipe out very carefully with clean soft rag. Next wash out crank case with paraffin.

Cleaning the Crank Case.

To do this, first drain out any used oil through the plug provided at the bottom of the crank case, replace plug, and pour about a teacupful of paraffin into the crank case, and revolve the engine gently, taking care not to damage the piston on the connecting rod or crank case studs. After this, the crank case may be drained and a fresh supply of oil injected.

Cutting Paper Washers.

Carefully clean the face of the crank case and cylinder, and see if the paper joint is intact; if not, another must be made. To do this, get a sheet of stout brown paper and hold it over the mouth of the cylinder, gently tapping it round the edge of the mouth with a light riveting hammer till a complete circle is cut out. Now smear the face of the cylinder with boiled linseed oil or seccotine, and press the paper into position. The remainder of the paper may now be cut off in a similar manner, and the holes for the studs cut out. The other side of the

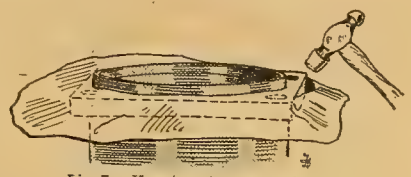

Fig. 7.—How to cut paper washers.

paper is then oiled or glued, and the cylinder is then ready for replacement. Before going further, however, see that the slots in the piston rings are not in line, and rub some oil round the sides of the piston. The writer uses Vasol for this purpose.

The cylinder may now be slid on, care being taken that the rings enter properly.

Bolt down the cylinder fairly, tightening the nuts at opposite corners evenly.

Replacing Studs.

It is possible that one or more of the studs may have come out of the crank case in the process of dismantling. If this is the case, they must be replaced before putting on the cylinder. The best method of doing this is to free the nut on the thread and then place two nuts on it. Now screw the stud back in the crank case, screwing down by the top nut only. When the stud is right home, unlock the two nuts with a second spanner, and the stud will remain in place.

Fig. 8.—How to replace a loose stud.

To replace the valves, follow the instructions for removing in the reverse order.

Before replacing the valve caps, see that the faces are quite clean and smooth.

Air Leaks.

The replacement of the remaining parts is simple, but care must be taken to prevent air leaks in the inlet pipe, especially on twin or multi-cylinder machines. The writer lags the inlet pipe of his twin with asbestos string and insulating tape.

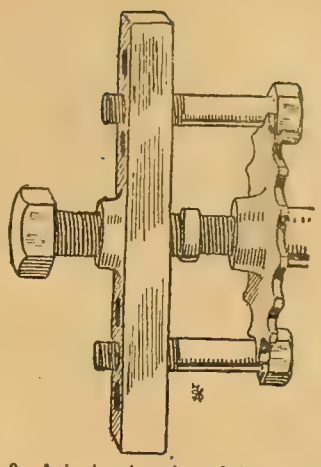

Fig. 9.—A simple universal sprocket withdrawing tool.

On some engines no tappet adjustments are employed, and there is no room for such fitments. In such cases a simple device on the lines of sketch can often be fitted. The end of the valve stem is screwed with a fine thread for about ¾in., the spring cap is then put on, next a lock nut, and lastly a deep nut into the base of which a fibre plug is pressed. Both nut and lock nut should fit rather loosely on the stem. A small hole in the valve stem, into which a spoke can be inserted, will prevent the valve from turning during adjustments.

A sketch is shown of a simple sprocket withdrawer, for use when special tools are not available. The heads of the two long bolts usually have to be cut down somewhat, as many sprockets are in awkward positions.

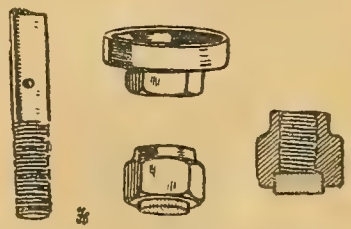

Fig. 10.—A simple substitute for a tappet adjustment.

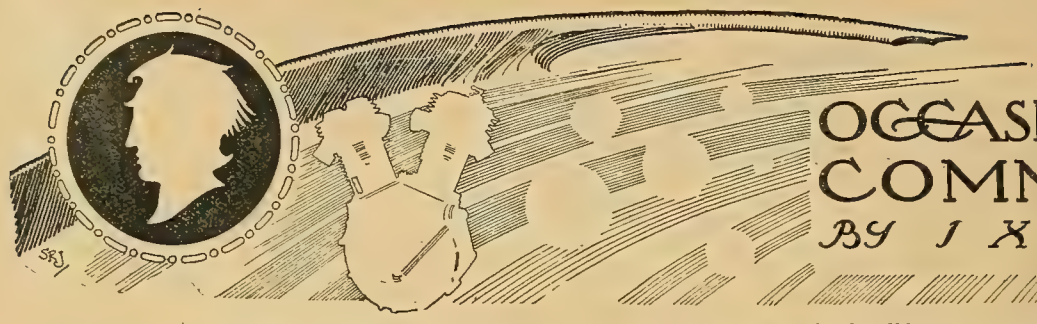
To remove a refractory engine pulley, a special fool is advisable, though even this should be manipulated gently, as the flanges are usually cast iron and easily broken.

A Detachable Hook Fastener.

The accompanying sketch shows the Challenge detachable hook belt fastener made by the Challenge Manufacturing Co., 19, Sand Street, Birmingham. A

The Challenge detachable hook fastener.

slightly different pattern is also sold provided with hooks of different sizes. These fasteners are exceedingly moderate in price.



OCCASIONAL COMMENTS

BY IXION

Sidecar Brakes.

The last show contained one or two sidecar outfits with formidable brakes on the side wheel; yet one of the latest trade catalogues denounces these brakes in unmeasured terms. Isn't it about time some authoritative experiences were coming to hand? There are plenty of insufficiently-braked sidecar outfits on the road, aye, and cycle cars too. If the sidecar brake can be made safe and effective, why should we not all have the benefit of it? At present there are many cases per week where the tremendous lock and powerful helm of a sidecar have to atone for a certain inadequacy in its brakes. It is not a bad plan to adjust the front wheel brake of a motor bicycle for excessive power when a sidecar is attached; as everybody knows, makers frequently arrange these brakes to be mildly ineffective, in case a novice should apply them violently on corners.

Lost Filler Caps.

My log tells me that in the last two years I have lost five petrol filler caps, a record which shows that I occasionally indulge in a soulless "blind," and that there is a faulty detail on my machine. Some machines have either hinged or chained caps. I do not propose to sell my machine because of this very minor—though irritating—failing; in fact, I think I see a cure. Within both filler caps there lies a tubular gauze strainer, and I propose to anchor the filler cap to the strainer by a few inches of the chain sold with toy watches. I question whether, even when my nose is at its lowest elevation, I could miss the spectacle of a filler cap, chain and gauze strainer flying through the air *en route* to the nearest clump of nettles. But here we have identified a congenital defect of the British manufacturer. The spares sale list and the running shed's requisitions must annually include a ridiculous number of filler-cap replacements; yet many firms contentedly fit the ordinary type of cap.

Another Detail.

How many front brakes have ¼in. nuts (or thereabouts) by which the brake shoes are locked to the spindles? I will not ask how many machines are annually minus a front brake shoe at the conclusion of a six day trial, but rather how many competitors may be seen furtively receiving small packages with a Midland postmark at the *poste restante* during the six days of the great and anxious week. In my resignation and folly I used to fancy that all front brakes embodied these tiny nuts, and shed their shoes at the rate of three or four a season; but last week I saw a machine—and it didn't hail from the Midlands—which had no small or rickety notions embodied in its front brake. It was three years old, and had never shed a brake shoe in its life; moreover, when I wanted to dislodge its shoes in order to change a front cover, I had to use quite a strong spanner and quite a medium mallet. *Si sic omnes;* which is Sanskrit for "all makers please copy!"

Exhaust Whistles.

Chequered are the experiences of the motor cyclist who buys an exhaust whistle of the ordinary brands. For the first 500 miles he is in raptures; he can waken and shift the usual surly, sleepy carter at a range of a mile or so. After 500 miles the horn is resuscitated from its disgrace, and remounted in a place of honour on the handle-bar, for the whistle has commenced to jam with carbon, and is giving trouble. During the next 500 miles the erstwhile gleeful owner wears a haggard but determined expression, for he is striving to perfect the very imperfect accessory for which he paid much good coin of the realm. If he follows my own history, he notices that the control valve of the whistle continues to open when he operates the lever or pedal, but that it won't shut, because its slide or spindle is foul with deposits of burnt oil. Perhaps he notices—like myself—that a coiled spring is provided to close the slide, and bid the exhaust cease its cheery and insistent yodelling; further, that the spring is about strong enough to return an electric bell-push. So—just as I have done, for great minds think alike—he fits an enormous spring—one of Terry's most terrific productions; and for a time he can wake the landscape or startle a hemisphere, secure in the consciousness that the ear-splitting din will cease when his forefinger quits the trigger. Then—for a good hundred miles—there is peace, the haggard lines smooth out,

A secret check at Rossington in the Doncaster and District M.C.C. Trial. The driver of the Rudge sidecar was dead on time, but the other too early.

Occasional Comments.—

and all seems well. Finally the strain on the whistle, compounded of the sturdy pull of its lever, the return pull of the giant spring, and the binding carbon, causes its numerous tiny screws and weeny threads to disintegrate, and it is scrapped *sine die*. I know one big firm in Coventry who planned to supply a ready-fitted exhaust whistle as part of their standard specification for 1912. In 1911 they got samples of every whistle on the market, and made several of their own design. Now they only sell and recommend hooters. I dare not say that my criticisms apply to every whistle on the market by any means; but they are true of all I have tried; so I would recommend purchasers to see that any whistle they think of buying has a substantial return spring to its control valve, and that it is not assembled with microscopic threads and petty screwlets. There is not the least reason why a sound substantial article should not be made and sold at a moderate price; but the market contains plenty of rubbish at present. The only consolation is that many motor car whistles are quite as bad, and they cost more!

A Punctured Float.

I have waited well over ten years—if memory serves aright—for my first punctured float. I took out a new trade machine, which refused to run decently and showed no liking for its extra air. Presently I discovered that the float chamber was leaking freely through its flood hole, and examination of the needle discovered no derangement. Out came the float, and a gentle shake showed that it was full of petrol. I rode on to the next village, and dived into a watchmaker's, where I soon learnt that the cure of this trouble is less simple than the books imply. We warmed the float and expected a hiss of escaping gas to tell us where the invisible puncture was. We heard no hiss, and the watchmaker's magnifying lens failed to tell us where the orifice lay. All we could trace was an almost imperceptible dampness round the top edge, covering perhaps an area ¼in. square. A far more powerful lens than the shop contained would have been necessary to find the microscopic hole through which the penetrating spirit was entering. I covered the whole damp area with a thin skin of solder and polished it off again, hoping a wee grain of solder would abide in the hole. No luck. I put the float back in its chamber, and turned on the petrol; when the float had filled it again, once more I expelled the fluid by heat. The same spot was indicated, and again I filmed it with solder, and polished it off. This time a grain lodged in the hole, for the float ceased to leak, though the lens was too weak to show where the place was.

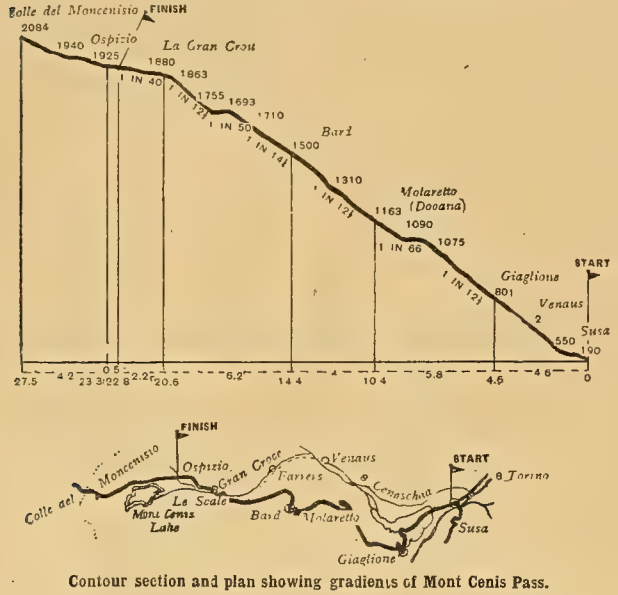
A Partitioned Toolbag.

I have just encountered one of those tiny refinements which add so disproportionately to our comfort. There are such a lot of small flat objects to be housed in the left-hand pannier bag (I take it for granted that most people carry their heavy tools in the right-hand bag—for some unknown reason). There are belt punches, and sparking plugs, and tyre repair kits, and spare fasteners. We mostly keep in the same bag a huge roll of rag, in which are ensconced a couple of spare valves, maybe; and when we pull out the roll, all the little flat things tumble out on the road. But I have struck a pannier bag—and standard, too, at that—which has the rippingest little shelf about an inch from the top; and the tyre repair kit, cased sparking plug, cased fastener, and belt punch, fit on to the shelf beautifully, and do not fall out.

Group of competitors outside the headquarters at the start of the Doncaster and District M.C.C. Reliability Run.

Something Like a Hill-climb.

NO one who is unacquainted with Alpine roads can form any idea of such a hill-climb as that which will be held on August 3rd on the Mont Cenis Pass by the *Società Sportiva di Torino* Via Cuneo 3, Turin. The event starts from a point just outside Susa, on the main road over the Mont Cenis Pass into France at 9 a.m., and the course winds over



Contour section and plan showing gradients of Mont Cenis Pass.

the mountain for rather more than 14 miles (22 km. 800 metres), rising in that distance 4,708 feet (1,435 metres). For the first 6 km. the gradient is 1 in 12½, then follows 1 km. of only 1 in 66, then follow 5 km. of 1 in 12½, 3 of 1 in 14¼, 1 of 1 in 50, and 2 of 1 in 12½, the latter being the zigzag known as *Le Scale*—the stairs. The final stage is only 1 in 40, and the finish at the Hospice on level ground. According to the survey there is nothing more than 1 in 12½, but we believe that the maximum gradient is 1 in 10, and, of course, owing to its great length the hill is very trying. The worst turns occur at Giaglione, Molaretto (Italian Customs), Bard, and Le Scale, where there are five hairpins.

The classes will be as follows: A up to 350 c.c., B up to 500 c.c., C private owners up to 500 c.c. Machines must conform to the usual A.C.U. regulations. Entries close at ordinary fees on the 24th inst., and at double fees up to the 31st inst. The entry fees are as follows: Classes A and B 40 francs one machine, 75 francs two machines, 100 francs three machines, and 20 francs for every successive machine. Class C 10 francs (8s. about) per machine.

A special gold medal has been offered by Queen Margherita, which will be awarded to trade entrants. Both the 350 and 500 c.c. machines are eligible for this prize. Other prizes will be as follows: The winners in each class of trade riders, a silver shield; to the manufacturers of the team of three machines which gain the best total time in the first class, a silver challenge cup, given by the "Stampa Sportiva." There is also a silver cup for the senior class called the "Coppa Moncenisio."

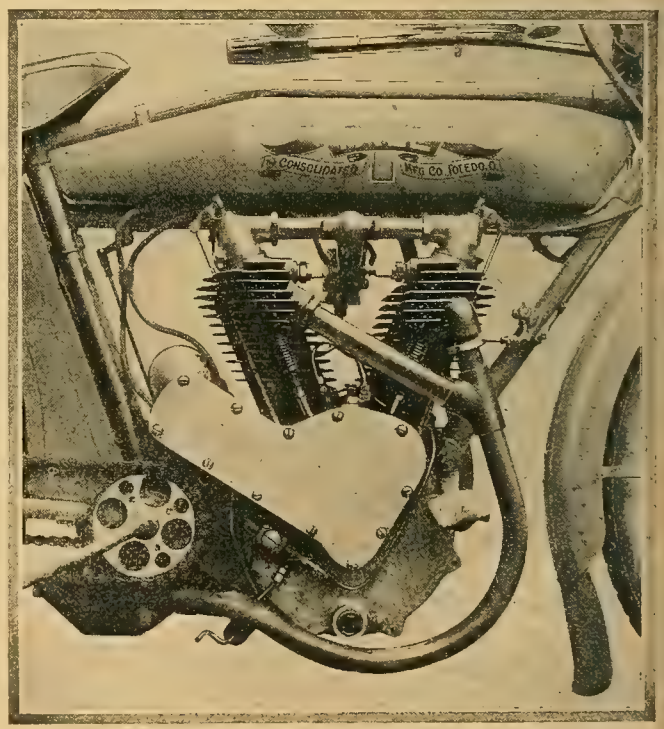
The Susa Mont Cenis hill-climb has been held for ten successive years, and an English machine has never yet won. The journey would be a delightful one, and full of interest, consisting of a fast run across France and beautiful scenery among the French and Italian Alps. The cost need not be excessive. The Auto Cycle Union would be glad to help intending competitors as regards the route and formalities, and as the writer will be spending his holidays in the district, he will gladly assist intending competitors, to the best of his ability. The regulations are not stringent, and practising is allowed up till 8 a.m. on the day of the contest. Intending entrants should send in their names to the *Società Sportiva di Torino*, and also to *The Motor Cycle* at an early date.

THE YALE MOTOR CYCLE.

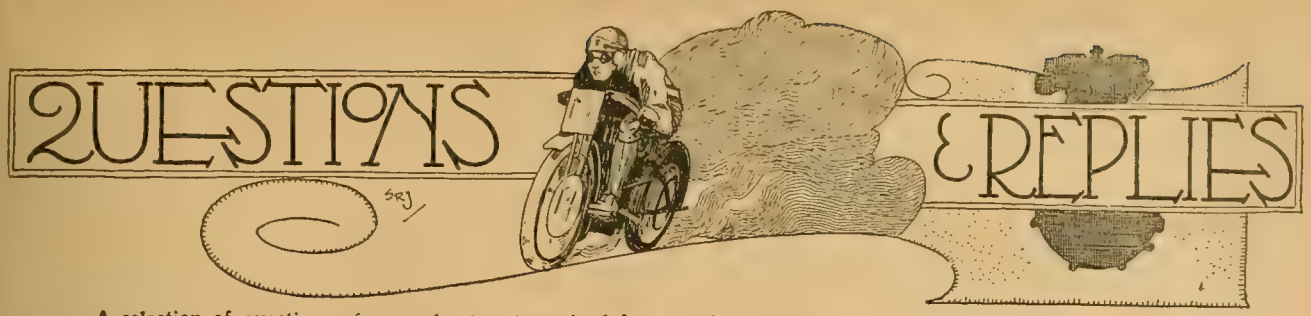
ONE of the features of the Yale, a leading American machine, is its comfort and wonderfully light steering, which are brought about by the design of the spring forks and the weight distribution.

The engine is of very interesting design, and has very large bearing surfaces and ten-inch flywheels. Helical gearing is employed in the cam gear and magneto drive, and a worm-driven plunger pump supplies oil to the front cylinder and cam gear.

Considered through English spectacles, the engine, with its horizontal radiating fins, is very well thought out, but the design of the exhaust pipes would hardly find favour, not only on account of the possibility of the front cylinder getting hotter than necessary, but also as the rear pipe renders the front exhaust valve and spring very inaccessible.



The twin-cylinder engine of the 8 h.p. Yale showing the valve arrangement.



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Rubber Belts.

I should be obliged if you could give me your opinion of the enclosed section of rubber belt. The core seems to me to be too much on one side—O.R.

The canvas core of any belt should be in the centre of the rubber, and not to one side. We therefore consider that the sample section is faulty in this respect.

Leeds to Exmouth.

Will you be so kind as to give me the best route from Leeds to Exmouth (Devonshire) and approximate mileage?—H.W.

Your best route would be as follows: Leeds, Pontefract, Doncaster, Worksop, Nottingham, Castle Donnington, Hinckley, Coventry, Kenilworth, Warwick, Stow-on-the-Wold, Cirencester, Tetbury, Didmarton, Bath, Chewton Mendip, Wells, Glastonbury, Taunton, Wellington, Collumpton, Exeter, Exmouth. The distance is approximately 300 miles.

Difficulty in Starting.

I have great trouble in starting up. The engine is a 5 h.p. water-cooled M.M.C., and started with starting handle; B. and B. carburetter with 32 jet, Lodge three or four-point plugs with points set to gauge supplied, accumulator ignition, make and break contact, spark is very good at points when plug is laid on top of cylinder; compression very good, and spark takes place about nine-tenths up the compression stroke; if I advance further it backfires. I have tried injecting petrol, but it only seems to fire about three or four times. There is plenty of petrol at jet.—W.J.

As originally made the engine you describe has an atmospheric valve, and this is probably the cause of the trouble. If the seat is oily the valve may be sticking, and fail to come off the seating at such low speeds as those attained by hand starting. The platinum points should be flat and clean and the accumulator well charged, as otherwise only a weak spark will occur under compression, even though it appear good when the plug is exposed. The fact that the engine fires a few times after petrol injection points to inlet valve or carburetter trouble. Possibly the inlet pipe is a very long one. This sometimes affects starting.

Decompressors and Easy Starting.

What is your opinion of decompressors? I had an Amac on a 2½ h.p. lightweight, but with it I could not get the engine to fire more than two or three times, and then very feebly. I have a 3½ h.p. Hobart with free engine, Binks carburetter, jets 3 and 6, and find it difficult to start with back wheel on ground, as one kick on pedals rarely starts engine, although on stand it is much easier. Would a decompressor improve matters?—W.M.P.

On a lightweight machine we do not think a decompressor necessary, but in the case of a 3½ h.p. engine a decompressor would probably be exceedingly useful. In fact, if a suitable instrument be fitted, the machine should start at a walking pace, and quite easily with a stroke of the pedals. The reason your engine starts more easily on the stand is because you can pedal the engine round at a higher rate of revolutions than is the case when using one crank and pedal as a kick starter.

Touring Advice.

I am contemplating a three or four days' tour in August with a sidecar, and shall be very pleased if you can tell me of a good route. I wish to go north, and to keep in the country and avoid main roads as much as possible. I should also be glad of information as to firms hiring out tents, etc., and picnic appliances.—H.A.D.

If you want a tour mapped out for you it is best to join the Auto Cycle Union, 89, Pall Mall, S.W., as a touring member (5s.), or the Automobile Association and Motor Union, Fanum House, Whitcombe Street, W., and apply to their Touring Department and get this done for you. The "Motor Cycle Route Book," post free 1s. 9d., Iliffe and Sons, Ltd., 20, Tudor Street, E.C., will also prove very useful. Particulars of camping outfits were given in our issue of April 17th, pages 484-485. The secretary of the Cyclists' Camping Association, Mr. A. P. Moeller, 6, Duke Street, Adelphi, W.C., may also assist you.

A feature of a run along the Great North Road is the number of level crossings which are encountered. Our photograph shows a group of motor cyclists held up at Sutton Crossing, near Retford.

From Water-cooling to Air-cooling.

I possess an Ormonde tricar of uncertain age, of which the cylinder is cracked. The cylinder is water-cooled, and I wish to fit a new air-cooled cylinder. The particulars are as follows: Bore 85 mm., stroke 85 mm., both valves (mechanical) are on one side. Do you know of any maker from whom I could purchase an air-cooled cylinder of above size that could be adapted to my engine? I think it possible that one of the well-known makers may have cylinders of this size.—T.F.B.

There is just a possibility that you may be able to obtain what you require from the Crypto Motor Co., 14, Mortimer Street, W., or from the Service Co., Ltd., 292-293, High Holborn, W.C.

Valve Grinding and Cylinder Cleaning.

I should be extremely obliged if you will advise me as to the use of the Cylclean process of removing the carbon deposits from motor cycle cylinders. I may say I am quite a novice, and know very little of mechanics. I have a 1913 Sunbeam, and had the cylinder down after 1,300 miles, and found it rather a job to get the deposit out, especially round the valves; in fact, I finished up by getting someone to finish it off for me. Is it necessary to grind in the valves each time the cylinder is taken down?—E.L.B.

The Cylclean process is entirely satisfactory, but it seems to work better when the engine is really dirty than when there is only a slight deposit. It is very quickly done, and does no harm at all to any part of the engine. It is not necessary to grind in the valves every time the cylinder is taken off, but only when the surfaces become pitted and the compression in consequence becomes weak. Still, it is a good plan, because it is so much easier to grind the valves when you have the cylinder on the bench. Do not, however, grind them more than is necessary at any time.

Mysterious Loss of Compression.

I shall be glad of your advice *re* the loss of compression in my engine when climbing after having run ten or twenty miles. It runs splendidly on the level, and climbs well when cool, but when hot, the compressed charge escapes past the piston rings and comes out of the crank case release and out of the tappet guides, and after that it climbs very badly. Sometimes during a long climb the compression will suddenly come back for a few hundred yards, but usually does not last. The cylinder has been reground and new piston fitted. The original piston had about eight half-inch holes drilled through it, but the new piston was solid; so thinking the fault might be caused by lack of lubrication, I had the piston drilled and holes drilled in the baffle-plates of the crank case, but the trouble still continues. Can it be due to unequal expansion of the cylinders, or would the piston rings being too tight a fit in the slots cause it, by binding when hot?—R.S.

We should imagine that the trouble is far more likely to be due to a lengthened exhaust valve stem, unless, of course, the piston rings get in line, but this is very rare. If the clearance is too small between the tappet and the bottom of the exhaust valve stem, the heat causes the stem to expand and the valve does not close properly, and there is no compression.

Somerset to Cumberland.

Can you oblige me by giving a route with approximate mileage from Castle Cary to Wigton, Cumberland? Please give the best direct route, also an alternative one, including Hebden Bridge (near Halifax). My machine is a 1911 3½ Bradbury with two-speed gear. I would also like to know of a few journeys from Wigton into the Lake District.—R.W.M.

Your best route would be as follows: Castle Cary, Bruton, Frome, Beckington, Bradford, Bath, Nailsworth, Stroud, Gloucester, Tewkesbury, Worcester, Kidderminster, Bridgnorth, Wellington, Hodnet, Whitchurch, Tarporley, Warrington, Wigan, Preston, Garstang, Lancaster, Kendal, Windermere, Ambleside, Keswick, Bothel, to Wigton. The distance is approximately 310 miles. This route takes you through the Lakes. We cannot give you a satisfactory route through Hebden Bridge. What we should recommend you to do if you want to go there is to go to Preston and take the train; otherwise it means going through an unpleasant and uninteresting manufacturing district thronged with big towns.

Tool for Re-cutting Valve Seatings.

Having read your book "Motor Cycles and How to Manage Them," I find in it that there is a special tool on the market for grinding valve seatings. I have a 1905 3 h.p. Triumph, which runs well, also pulls well when cool, but after climbing a long hill it gets very hot and starts knocking, and then suddenly stops. It has good compression, valves have been ground in, timing correct, carburetter in perfect order, and tappets correctly adjusted. I have also had cylinder ground and new piston fitted. So, after reading the book, I find that my exhaust valve seating is worn down quite ⅛in., and came to the conclusion that was my trouble. Could this grinding be done personally?—C.H.D.

The tool you mention can be obtained from Southern Automobiles, Ltd., Westcombe Park, S.E. There is also a similar one sold by the Service Co., Ltd., 292-293, High Holborn, W.C. You might try lubricating a little more frequently. Certainly the valve seating might be re-cut. The matter is one which may be carried out by an expert amateur, but it is not a job for a novice.

Bedford to the Lake District.

Will you kindly give me the best route to the Lake District from Bedford with an alternate return?—A.J.G.

Your best route would be as follows: Bedford, Eaton Socon, St. Neots, Stilton, Stamford, Grantham, Newark, Tuxford, Retford, Doncaster, Ferrybridge, Aberford, Boston Spa, Harewood, Otley, Skipton, Settle, Kirkby Lonsdale, Kendal, to Windermere. An alternative return route would be *viâ* Penrith, Bowes, Brough, Barnard Castle, Scotch Corner, and southwards *viâ* Boroughbridge and outward route.

Dry Batteries and Speed.

I have a 2 h.p. motor cycle with dry battery, from which I wish to obtain a higher speed. The battery I have had tested and it registers nearly 4 volts. If I get a new battery, 4½ volts, will that alter the speed? I only get about 60 miles to a gallon of petrol, and I believe I should obtain from 100 to 120 miles to the gallon. What alteration shall I have to make?—H.W.

The strength of the battery would not alter the speed appreciably. However, you do not test a dry battery with a voltmeter, but with an ammeter. Certainly you ought to get 100 miles to the gallon with a 2 h.p. machine. We should recommend you to try a smaller jet. Also take pains to find out if the inlet pipe has no leak in it and that it is a gas-tight fit at the union with the cylinder.

LOST AND FOUND.

We receive many letters regarding accessories, etc., both "Lost and Found," which we are unable to find space for. As these particular matters are of interest to two persons only, viz., the finder and the loser, we have decided to keep a list of such articles, and all that are notified to us will be inserted in this list. Should we receive a letter from the finder which corresponds to the article lost, the two persons will be put into communication, but it must clearly be understood that we cannot enter into correspondence on the matter beyond this.

READERS' REPLIES.

Portsmouth to Harrogate.

On page 865 of your issue of the 3rd inst., in reply to "G.L.C.," regarding a route from Portsmouth to Harrogate, you advise through Winchester, Newbury, and East Ilsley to Oxford. I have recently been by this route twice, and find the road from Winchester to Newbury to be in a dreadfully loose state, with very sharp flints, which did considerable damage to my rear tyre on a Model A Douglas. I would strongly advise your correspondent to cut out the Winchester-Newbury Road to Oxford and substitute the road from Winchester *viâ* Basingstoke and Reading to Oxford. This will add about eight miles to the total journey, but the road is far preferable to the one suggested, if the question of tyres is to be considered.—CR 1566.

Lack of Reliability.

If "Clement," who enquires *re* 2¼ Clement-Garrard machine in your issue of *The Motor Cycle* of June 19th, cares to write to me, c/o the Editor, giving his address, I can give him information of a practical kind on the points he mentions, as I have been using a similar machine for the past six years.—WM. REDPATH.

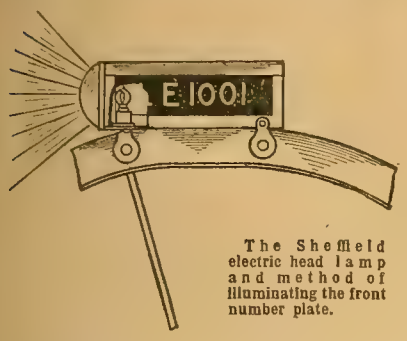
EXPERIENCE WANTED.

"Barry" (Manchester). — 5-6 h.p. Rudge-multi with sidecar. Consumption reliability, slow running in traffic.

AMONG THE ACCESSORIES.

A New Head Light.

The accompanying illustration shows an electric head light and illuminated number plate combined, brought out by

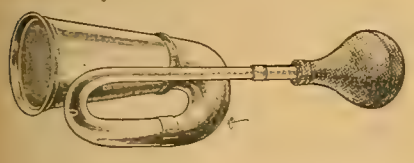


The Sheffield electric head lamp and method of illuminating the front number plate.

the Sheffield Patents Co., Times Buildings, Sheffield. The device should certainly be handy for riding during dusk and in towns.

Novel Waterproof Cap.

We recently paid a visit to the premises of Messrs. John Piggott, Ltd., 117, Cheapside, E.C., where much of interest to motor cyclists is always to be found. Among their specialities for this year is a 2¾ h.p. lightweight motor bicycle, single-cylinder, 70 × 75 mm., which is excellent value for the price asked for it, fitted with footboards and pedals, U.H. magneto, B. and B. carburetter and an Armstrong gear or Albion clutch may be fitted as an extra. As

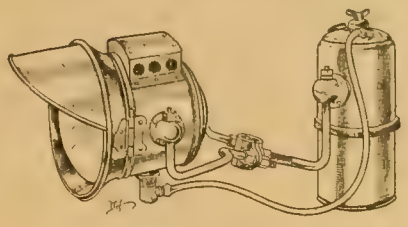


regards accessories, Messrs. Piggott have introduced a simple form of motor cycle horn, sold at a very moderate price. It has a gauze-covered mouth and gives a clear and audible note of warning. Being simply designed it is most easy to clean. In connection with clothing, the Double-purpose cap illustrated is most interesting. It will be seen by fig. 1

Fig. 1

Fig. 2

Fig. 3



Motor cycle lamp sold by Messrs. Piggott.

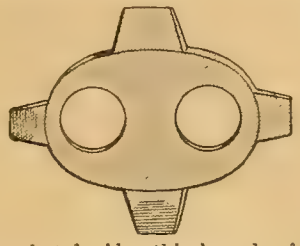
that the cap, under ordinary conditions, is exactly like any other. Figs. 2 and 3 show how it can be converted into a most effective waterproof cap. Such a cap as this should be invaluable to those who take long tours, and yet desire to be independent of the weather. It is one of the most ingeniously designed caps we have ever seen. Messrs. Piggott have also lately introduced a motor cycle boot, which has a very thick sole, waterproof tongue, and long uppers, which is absolutely water and dustproof. These are but a few of the specialities Messrs. John Piggott, Ltd., sell for motor cyclists.

A Neat Switch.

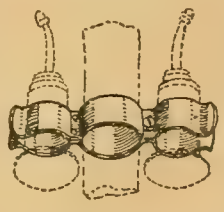
The accompanying illustration shows a handy little cut-out switch made by the Aston Motor Accessories Co., Birmingham. It is very well designed and impervious to wet.

A Four Bladed Screwdriver.

Messrs. Herbert Terry and Sons are, above all, specialists in the manufacture of

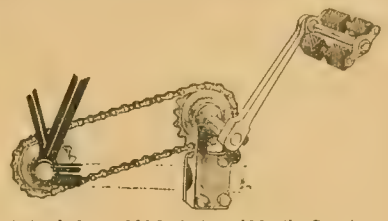


springs, but besides this branch of their business they manufacture many articles useful to motor cyclists. We illustrate a pocket screwdriver which has four blades for various sizes of screws, and also a double clip which holds a petrol and oil squirt on any convenient part of the frame without any possibility of rattle. Route card holders, valve removing tools, spiral vaporisers to fit over jets, terminals, and flexible cable are among the many articles listed by the company.—Herbert Terry and Sons, Redditch.



A Simple Form of Foot-starter.

A simple form of foot-starting device, which the illustration renders self-explanatory, has been introduced by the Grandex Cycle Co., 86, Grays Inn Road, W.C. Many pedalless machines cannot be started on the stand, and in such cases this device would be of great



A simple form of kick starter sold by the Grandex Cycle Co.

service. Moreover, the Grandex starter might take the place of pedals in the case of a three-speed clutch machine; room would then be left for footboards.

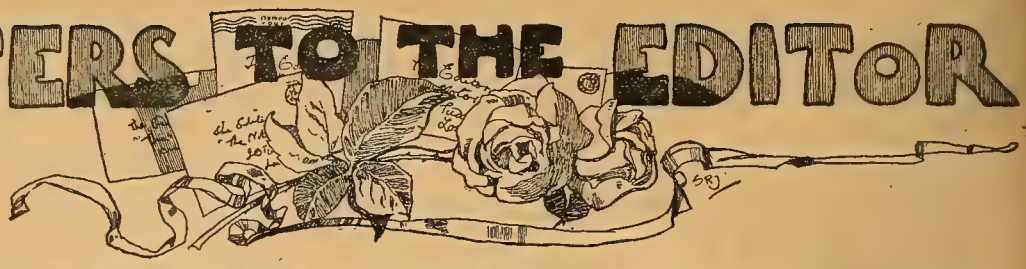
Beldam Motor Cycle Tyres.

Quite an interesting tyre is the Beldam motor cycle tyre, manufactured by the Beldam Tyre Co., Ltd., Brentford. The feature of this tyre is the shape of the tread, which provides an ample thickness of rubber, while its non-skidding properties are due to the V-shaped projections, which serve a double purpose. They provide an additional radiating surface to the tyre to keep it cool, and secondly act as efficient non-skids. Moreover, they allow lateral displacement of the rubber as opposed to circumferential displacement. In the case of circumferential displacement it is held that the rubber heaps up in front of any object it may strike, and that the object is therefore driven into it; consequently, a

puncture is the result. In the case of lateral displacement, however, this does not happen, and a firm grip of the road is obtained. This tyre has only recently been placed on the market, and since its introduction has been further improved by the addition of transverse grooves. It is beautifully made by the same firm which produced the car tyres that came through a 5,000 miles R.A.C. test last year with great success.

We have now run one of these tyres on the back wheel of a 6 h.p. motor cycle for about 800 miles, half the distance being with a sidecar. The tyre has stood up well, and there is plenty of rubber left on the tread.

LETTERS TO THE EDITOR



The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Unstretchable Belts.

Sir,—In reply to "J.T.B.," I beg to say that I do not think that he or anyone else has ever seen a belt of exactly similar construction to the one I am introducing. If they have, no doubt the Controller of Patents would be pleased to hear their objection to the sealing of my patent. "J.T.B." says he knows one maker who discarded a similar belt six years ago. I should like to tell him that I know two, one of them a very influential man in the belt trade, who have told me that they have been experimenting with this class of belt for a long time, but were unable to bring out a suitable fastener. As to "J.T.B.'s" opinion that a belt that will not stretch is not worth having, all I can say is that his opinion is very different from that of any motor cyclist I have spoken to on the matter.

A. PERKINS.

The £100 Cycle Car.

Sir,—In your description of the new single-cylinder A.C. four-wheeler in your issue of June 26th, you hail it as a definite step towards the £100 four-wheeled cycle car. But this desideratum has already been actually accomplished with success by the maker of the L.M. machine, whose specification includes a twin-cylinder 8 h.p. engine with chain drive to live axle, driving both wheels through a balance gear, at a price of £99 15s.

I do not drive an L.M. or any other cycle car, and have no interest in any, and I may possibly be mistaken in the above specification, but believe that I am right; and in any case the L.M. should have the credit of being the first £100 four-wheeled cycle car.

C.F.W.

A Protest.

Sir,—I should like to protest against this year's Six Days' Trials being held in the Lake District. As a matter of fact, I think it quite unnecessary to hold them at all, especially if they are to take place in a part of the country frequented by holiday-makers. If motor cyclists must have a test of this sort, cannot they find some spot well away from civilisation and beauty, where they will not disturb the peace, quiet, and pleasure of tourists; or else distribute their route in such a way that it covers a far larger area, and by so doing minimise the discomfort and annoyance they undoubtedly cause to people in a particular district?

It would be a thousand pities to have the peace and quiet of our Lake District spoiled for some time by motor cyclists racing past its beauties, round its corners, up its hills—and its mountains too—ignoring everything except the pace of their machines.

What will the district be like for some weeks? To those of us who are used to spending our holidays there (and I am one of some twenty or so friends on whose behalf, as well as my own, I am writing) it will be absolutely unbearable! People who come to Keswick and the surrounding parts come there for that peace and quiet which in England only the Lake District affords. As a well-known resident of Keswick has said in a letter to me on the subject, "For every one person this sort of thing attracts it will drive twenty away"; and this I feel to be true.

I only hope that this protest will be taken up in the spirit in which it is written—that of protecting from all such disturbances the most sublime piece of country we have.

I might add that I am a keen motor cyclist myself.

HOWARD PEED.

[We like to give all points of view, so we publish the above letter and deal with it in our leaderette.—ED.]

A Revolutionary Suggestion.

Sir,—"L.M.M.J." has courteously forwarded me copies of the letters, the contents of which he considers me to have misrepresented. There are several passages in these relating to the "dimensions" of his proposed trumpet valve, and in view of our controversy as to whether his valve was more or less frangible than the standard solid type, I consider it was perfectly legitimate to interpret these as meaning an increase upon the normal dimensions. His letters do not, however, appear to have claimed that the use of special materials was possible, and on that point my comments were unfair to him, for which I am naturally regretful. I received several other letters on the subject, and in this detail I must have fathered somebody else's notion upon him.

IXION.

Sir,—As stated in my previous letter, a valve of almost identical shape to that suggested by "L.M.M.J." has been successfully used on racing cars. It is a very good shape, particularly for the inlet valve, as the underside of the valve is approximately of what might be termed "streamline" form. That is to say, it *gradually* changes the course of the gas. Thinking that the thickened neck rendered such a valve particularly suitable for motor cycles, I suggested this construction to a designer of a large firm, and showed a sketch which is quite as extreme as the illustration put forward by "L.M.M.J." I was told that these valves elongated slightly and decreased in diameter accordingly. I cannot help agreeing with "L.M.M.J." that "Ixion's" criticism was unmerited.

ERIC W. WALFORD.

The Transmission Question.

Sir,—I have closely followed the transmission question as shown in varied personal experiences recounted through your columns and, perhaps, may be permitted to add another mere experience.

For four years I had belt drive on my Triumph and was satisfied—because I knew no other.

This year I have "gone over" to chain transmission on my Indian; and by comparison I realise now fully how much labour was seemingly unnecessarily expended in constant attention to keep the belt in proper condition.

I have completed over 2,000 miles without the slightest trouble with the chains. The two adjustments have taken such a little time that the sum is negligible. A mere twist with a wrench on the spindle nut and five seconds at each adjuster at the fork ends and the nut retightened and the whole job is completed.

At 2,000 miles, when the chains were given a soaking a close examination proved both faultless. No sign of wear whatsoever was shown, although my chains are not enclosed.

I can only say that I have found, with a properly working clutch, chain drive "velvet" under all conditions; and I am certain never to return to belt drive.

C. R. WADMAN.

Where to Stay.

Sir,—A correspondent, "AL 2162," approaches you on this much vexed question, and your reply refers him to the A.C.U., or the A.A. and M.U., although he distinctly states that his pocket runs to about 5s. for tea, bed, and breakfast. Now this is about my own figure when on the move, and I think extremely few places to meet it will be found on either of the above lists.

The Cyclists' Touring Club caters for the man of limited means, and as the council of this body have recently shown

very plainly their determination to cater for motor cycling members by refusing to give publicity to the fulminations of a few hot-headed back numbers, motor cyclists might as well avail themselves of the very excellent handbook of hotels, *cafés*, boarding houses, and farm houses issued by the Club.

Another body issuing a guide book of economical hotels—mainly temperance—is the Commercial Travellers' Christian Association, of Aldersgate Street, E.C. They have a small monthly, called *Good Lines*, at 2d., which incorporates a very good list of hotels.

I trust this may help a few of your readers who find it necessary to watch carefully the "bawbees."

"AL 2162" will be well advised to take his holiday in July or September if he fancies the Yorkshire coast.

J STUART-WHITE.

A Lightweight in New Zealand.

Sir,—As readers of your journal, *The Motor Cycle* (to which, we may say, we always look forward, although received seven weeks after publication), and noting several remarkable performances by motor cycles of various makes, we thought perhaps you would be interested to know how the Levis motor cycle is faring in the colonies. We may say we have given this motor cycle a most severe testing, and it comes out with flying colours. Both in hill-climbing and reliability it has quite surprised us, although so small a machine. We have known it to take hills which an ordinary 3½ h.p. would not climb. We entered it in the New Brighton beach race (eight miles) on April 24th; it was the smallest motor cycle entered. Result, Levis 1st. On May 24th we again entered one machine against twenty-one, all powerful machines up to 7-8 twins. Result, Levis 1st; the only machine to make a non-stop run, and the smallest power entered, one firm alone putting ten 3½ h.p. machines in the race against one Levis. We consider that we are safe in recommending the Levis to anyone.

Christchurch, New Zealand. PITCHER BROS.

Carburetters and Flexibility.

Sir,—All motor cyclists will agree with your leaderettes as far as the necessity for greater flexibility is concerned, also that the lack of it is principally due to the type of carburetter at present in vogue; but I imagine very many will shake their heads at the suggestion that the solution lies in the automatic carburetter.

A truly automatic carburetter (if there is such a thing) should give a uniform mixture at all engine speeds; but no alteration can be made whilst riding to compensate for variations in the temperature of the engine or the atmosphere, or for whether the engine is running under heavy load or light. Imagine a machine facing a long steep hill that is just within its power; there are very few good riders who will go the whole way up without altering the air lever, though the throttle may not be touched, and the speed of the engine may be practically uniform.

Compromise in this, as in so many other motor matters, seems to me the best solution. As you point out, the need for the automatic carburetter is most felt in traffic, and if with a two-lever carburetter the engine can be made to tick along at 5 or 6 m.p.h. on top, and open up to 18 or 20 m.p.h. by moving the throttle only, very few riders will object to manipulating the air lever a little, above the latter speed; in fact, on the open road this adjustment adds zest and interest to the riding. This desirable result can be obtained by fitting some form of by-pass or pilot jet.

The poor running at low speed of the average motor cycle carburetter is due to the following: As the throttle is closed down, the rush of air round the jet is greatly reduced and insufficient petrol is drawn out; at the same time the suction in the inlet pipe greatly increases, because the engine is trying to draw mixture past the closed throttle; this causes air to leak in at any faulty joint on the pipe and up worn inlet valve guides, but if a by-pass or pilot jet be fitted, the increased suction in the inlet pipe will draw a sufficient quantity of rich mixture from it to counteract these defects. As the throttle is opened and the suction on the main jet increases, the suction in the inlet pipe is reduced and draws less of the rich mixture from the by-pass. This balancing action will maintain the quality of the mixture at the lowest speed. My experience has shown that with one of these devices fitted the air lever never needs closing below the best position for about 20 m.p.h.

FRED BADCOCK.

£30,000.

Sir,—Being in want of something to do one evening, it occurred to me that it would be interesting to know the total value of all second-hand machines advertised in *The Motor Cycle*. The result surprised me very much, as, excluding new and shop-soiled machines, also sidecars and miscellaneous articles and machines for which offers were wanted, but including cars and cycle cars, the figures were over £30,000. These figures should prove the value of *The Motor Cycle* as an advertising medium, bearing in mind that there would be several more thousands to add if everything was included.

B. C. HARVEY

Wear of Bearings.

Sir,—The article on "Wear of Bearings" in your issue of June 26th was most interesting, if only on account of the inference by "A.M.I.C.E." that practically any alloy, or even a lead bearing, would give the satisfactory results looked for, if efficiently lubricated. In this I cannot believe that he is serious. May I suggest that, so far as the bearing itself is concerned, it is most important to use the alloy of phosphor bronze or white metals most suited to the purpose required, and to cast this in such a manner as will eliminate segregation; that is, give a close even grain to the bearing structure. Such bearings are now being produced and used most successfully in the motor industry. Still the point is that we must lubricate and lubricate efficiently, and in regard to that I am glad to have the opportunity of endorsing all the remarks of your contributor.

A.M.I.MECH.E.

Is the Three-wheeler a Cycle Car?

Sir,—It would be interesting to know whether the A.C.U. definition is to be maintained and whether the three-wheeler will continue to compete with cycle cars. The A.C.U. definition explicitly includes three-wheelers. The C.C.C. in its hill-climb excluded them. The B.M.C.R.C. also excludes them in the Six Hours' Trial—the consolation race for cycle cars which have not entered for the Grand Prix. The latter club has gone a step further and does not allow three-wheelers over 1,000 c.c. to compete at all. On the other hand, the Cycle Car Cup for the hour record and all records at Brooklands are open to cycle cars which come under the A.C.U. definition. So also were the Hereford Cup, the Shelsley Hill-climb, and the Porthcawl Speed Trials—all won by three-wheelers.

The term "cycle car" was invented to denote a light, inexpensive machine—the missing link between the cycle and the small car. If the lightest and least expensive type be excluded the term becomes meaningless.

We have always maintained that the three-wheeler possesses advantages which the four-wheeler does not share in an equal degree. We are glad that this is now acknowledged by the admission that (we quote *The Motor Cycle*) "it is only natural that a three-wheeler should beat a four wheeler of equal power"—and therefore natural, perhaps, that some manufacturers of four-wheelers should wish to have a little class all to themselves. H. F. S. MORGAN.

One of the latest model water-cooled Chater-Lea cycle cars on the Sussex Downs near Brighton

Tyres and Accessories in the T.T.

Sir,—Replying to the letter from "Further Interested" in the issue of July 7th, I think the following may help to enlighten this gentleman on the points he raises. In the first place, as a racing competitor of some experience, I can give the denial direct to the statement that men would use any tyre, no matter how poor the quality, provided the inducements offered were sufficiently large. This must appear ridiculous to anyone who knows anything about the game, because the prizes offered by manufacturers are only given in the event of the competitor being successful. Therefore unless the rider knows something of the quality and reliability of the tyres he is asked to ride, he is certainly not going to risk his neck for a remote chance of success under any consideration. If "Further Interested" has ever taken part in any of the big racing events, such as the T.T., he will have some idea of the huge expense competitors are put to, and undoubtedly, were it not for the support given by manufacturers, many of the most brilliant riders would be unable to compete.

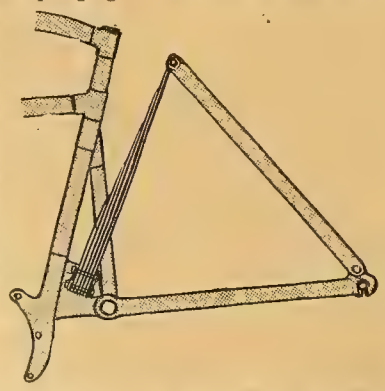
With regard to the last paragraph of his letter, I think your correspondent shows considerable bias. He states that there are "dozens" of various makes of British tyres on the market of far better value than the foreign ones. I think pretty nearly every British and foreign make of tyre was represented in the T.T. race, and had equal chances, and I have yet to be shown how cash prizes offered by tyre manufacturers can affect the performance set up by their tyres in competitions. As to who ultimately pays for these prizes, I think that is a question which can best be answered by the manufacturers themselves, but the same question could be asked with regard to the large amounts spent annually in press advertising by every British and foreign tyre company, and without which their goods would have a very poor chance of getting on the market.

With regard to the remark that foreign makes of tyres have gained their reputations by fictitious means, I should like "Further Interested" to explain himself more fully on this point. In the interests of fair play, I must say that I have never come across an instance of this. "Live and let live" is a motto which "Further Interested" might well take to heart.

GORDON L. FLETCHER.

Rear Springing.

Sir,—I notice that in *The Motor Cycle* "Ixion" again discusses the topic of rear springing. I am therefore enclosing a sketch of a laminated rear springing device which I have provisionally patented. As you will see from the sketch, a set of quarter elliptic laminated springs is attached to each of the back down stays and fixed by their lower extremities to a special lug situated at the junction of the seat tube and the horizontal stays. This lug also carries the swivelling device for the last mentioned stays. An additional stay, which is suitably fixed to the seat tube, passes between the two sets of springs, and is then secured to the special lug. I might say that I shall be pleased to hear from anyone interested in the invention.



G. S. PATRICK.

Carburetters and Flexibility.

Sir,—I read with much interst your leading article on "Engine Flexibility" in your issue of July 10th, and feel that I must give your readers my experience of the Amac carburetter. My engine is a 6 h.p. a.o.i.v. twin, and my great difficulty, when first I had it, was to get good results from the carburetter then fitted, which was a well-known two-lever pattern. I was at last persuaded to get a carburetter of the automatic type, and I must say it would run slowly, but sudden opening of the throttle choked, and on slowing uphill the engine knocked badly and the absence of air control became apparent, insomuch that I was obliged to change down to keep going. My next purchase was an Amac, and the result has been remarkable

I always run with a sidecar, and my gear is a P. and M. 4⅛ and 8½ to 1. With an injection I can start in three yards every time perfectly cold, change up and throw my air right open, where I leave it, very often running twenty or thirty miles only using the gas lever. When I come to a bad hill, I can plug along on top gear for a long time by slowly closing my air. I can average with sidecar 28 m.p.h. for, say, fifty miles; my health prevents me keeping it up. I can run on top gear for miles at about 6-8 m.p.h., and on low gear slower than a telephone call. My consumption is about 50 m.p.g.

I know the Amac people do not claim their carburetter to be automatic, but personally, as a practical motor cyclist, I can tell your readers it is automatic in the best sense of the word, *i.e.* having always your air lever to fall back on in emergencies.

I need hardly say I have no interest whatever in the firm.

ERNEST MAYS.

Win, Tie, or Wrangle!

Sir,—I trust that you have not yet purchased the extra large w.p.b. alluded to in the leading article of last week, and that you will do me the favour to publish the enclosed letter. I have **already** addressed it to the editor of *The Field*, but to my very great surprise it has not been published.

"I see that in your report of the Wessex and Loanshire match that you state that I was bowled by Colin Barnes. This is, I consider, an aspersion upon my cricketing ability, and I should therefore be glad to see the following explanation in print.

In the first place, I was not ready and never saw the ball at all, nor did I attempt to play it. Secondly, it was plain to anyone that the ball was a yorker which broke both ways and would have bowled the best batsman. (This I think should have been stated in your report.) Thirdly, the sun being in my eyes, I mistook the ball for a half volley and tried to drive it past second slip. Fourthly, the umpire, who gave me out, was an obvious partisan and was not looking at the game, but at a girl amongst the audience. I noticed this just before shutting my eyes to hit. In view of this explanation, I trust the committee will see their way to grant me a non-stop certificate and a gold medal—I mean a century not out, instead of what is vulgarly called a 'blob.'"

A. R. ABBIT.

Benzole.

Sir,—Perhaps some of your readers will be interested to hear my experiences with benzole. I have now used it for some months on my 1911 P. and M. with sidecar for most runs.

At Whitsuntide we toured the Lakes. Total weight was about 24 stones (we carried all luggage and spare benzole); total mileage, 300 exactly; consumption, 3⅛ gallons! This result has not been faked in any respect by slow driving, as we have pegged on merrily most of the time.

I am confident that on fairly level country I could get 120 m.p.g. if I never exceeded the limit.

Now, as regards to power, it has converted my 3½ h.p. into 5-6, as I have passed most outfits on hills and on level. My engine knocks badly when using petrol, when changing to high gear, or on climbing hills, but I can drive all day long and never have to retard the ignition.

I have a Binks carburetter on my machine, to which I have fitted an extra air inlet (this before using benzole), as I thought it extravagant when running solo, as one never gets off the pilot jet except on hills, and the pilot jet is admitting a rich mixture according to Mr. Binks. My air inlet will allow extra air to engine on both pilot and main jet. I find that if I am going nicely on level at, say, 20 m.p.h. on pilot jet, I can get 25 m.p.h. by admitting more air, which proves conclusively that the pilot is extravagant.

A. ROBINSON.

A.C.U. Silencer Trials—Judges' Supplementary Report.

Sir,—We are pleased to note that the A.C.U. have at last published some data obtained at the bench test, but a perusal of these data, we feel sure, cannot but add confusion, as the judges anticipate, on account of the somewhat contradictory nature of the report.

The question is sure to be asked how it is that back pressure and engine speed are opposed instead of being in relation to each other. For instance, the third Clair silencer which we entered obtained the highest engine speed in the tests both on the slow and fast test, and yet against this silencer is recorded 0.37 lb. per square inch back pressure.

Our second Clair silencer obtained a somewhat less speed on both tests, but the back pressure recorded against it is only 0.27 lb. per square inch.

The Chase silencer failed to obtain such a high engine speed as our No. 3 Clair silencer, but it is credited with less back pressure. There is evidently no doubt of the correct recording of the engine speed, which, in other words, is engine power, and it appears to us that if the back pressure measuring instrument were also infallible the results recorded are against all text book theory and the general acknowledged principle, and, basing one's argument on the data of this report, one could say that back pressure tends to increase engine speed rather than decrease it.

This report of the bench test also opens up the point of the reliability of placing too much importance on the track test portion of the trials. In the track test it will be remembered that the Chase and Hutton silencers were credited with an increase of speed with their silencers fitted, whereas our No. 3 silencer was debited with a loss of 0.39 m.p.h., yet on the bench test this Clair silencer obtains a considerably higher speed than either of these other two silencers, and even less back pressure than the Hutton.

The judges have undoubtedly had a most difficult task in view of what cannot be considered other than contradictory data, and we think it is a pity that they have not seen fit to include in this supplementary report the proportion of marks allotted under different heads. For instance, what proportion of the marks were allotted to the track test, and what proportion to the bench test, and how were the data, obtained at both tests, reconciled with each other in view of the discrepancy which we have pointed out?

Now that the data are published we should like to mention publicly that the second and third Clair silencers which we entered were of *identical construction in every possible detail*, and we purposely entered these two identical silencers with a view of proving, for our own information, the reliability of the data, and we cannot but confess that we are startled at the considerable difference in the data reported for these two silencers alike as regard the engine speed, the back pressure, the marks for noisiness, and the total marks allotted.

From the commercial point of view we are quite satisfied, especially as the Clair silencer heads the list for power; but we looked to these tests to furnish us with what would have been valuable information for our workshop use had the results been, in our opinion, reliable.

J. C. LYELL AND CO., LTD.,
FRED G. GAUNTLETT, Manager.

Belfast v. Dublin.

Sir,—I notice in *The Motor Cycle* of the 10th inst. that particulars of the above event, held a fortnight ago, are published, and that, in common with other papers, you have been supplied with a report of an important contest, the actual results of which, up to the present date (the 11th inst.) have not been officially verified or announced.

The onus of making arrangements for this year's run lay with the Southern Centre (M.C.U.I.), as Dublin was the starting point, and it was understood, as per custom, that the last pair of riders would collect and bring with them the returns of the secret and open checking stations; but as the returns from those stations controlled by the Southern Centre were not forthcoming, when the run terminated at Belfast, it was found impossible to hold a joint meeting of Ulster and Southern Centre representatives to examine and check the returns by which the result would be known; it was therefore left to the acting secretary of the Southern Centre to furnish the check sheets of the controls under his jurisdiction, but as these, for some reason, are still withheld, the actual result of the inter-city contest still remains in abeyance, and will do so until the Ulster Centre Committtee is afforded an opportunity of going over the returns, etc. Much to their surprise, while waiting for such, a Dublin newspaper published an account of the run, giving times and figures so manifestly one-sided as to leave no doubt that the Southern Centre riders had virtually a walk-over. Later on *The Irish Motor Cyclist*, in a more modified article, claimed victory for the Dublin men. No notice was taken of these statements by the Ulster Centre Committee pending the receipt of the checking returns from the acting secretary of the Southern Centre, who, though written to several times, has not replied. When, however, *The Motor Cycle*, the leading journal of motor cycling matters, has been furnished with particulars, etc., that still require full and proper verification, I feel it incumbent, as head of the Ulster Centre, and on behalf of its committee, to write and give you the actual facts, and also a contradiction of what has already appeared in the press. Until the committee of the Ulster Centre have had before them all the documents or records of the run for their inspection and satisfaction, the result cannot be pronounced; in this case a victory has been claimed, but as yet the proofs that it was one are still wanting.

Trusting to your courtesy and impartiality to give publicity to this letter in your next issue, and thanking you in anticipation,

R. G. LINDSAY,
President of the Ulster Centre M.C.U.I.

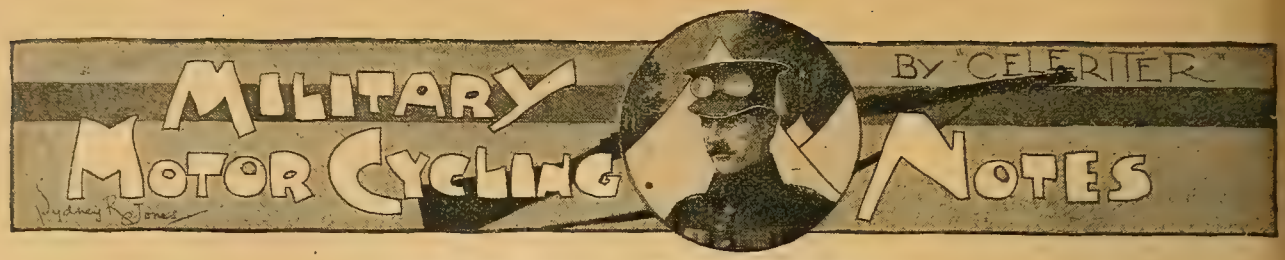
Hill-climbing Formulæ.

Sir,—I trust you will be able to find space for the following letter, although it is rendered perhaps unnecessary by your editorial comments, which certainly show that my formula gives valuable results, and by your remarks in regard to incorrect data. In the first instance, Mr. Morgan's letter is, of course, very reasonable, as he has been misled by the printing of wrong figures, and he is quite right in pointing this fact out. I would remind him that if the constants are chosen correctly, and it is quite easy to produce an equation to give these constants if necessary, the formula gives very satisfactory figures indeed. It would appear that Mr. Feeny has also taken the wrong figures for granted, and, I am afraid, it is excusable, because he had no other figures to see; but it is surely fairly obvious that, when this inaccuracy is removed and the correct figures taken for the Chota, the results are very regular, and, to a great extent, what one would expect by using commonsense. As regards what Mr. Feeny is pleased to call the theoretical aspect, I would point out that he has not read my original letter, which was not published in full as it happens, as it was written in the first instance to correct an error which stated that *The Motor Cycle* formula was to be used for the hill climb. It is perfectly easy to regulate the constants by means of another formula, but this is really quite unnecessary, because it is distinctly stated that the constants are chosen to suit the capacities of the machines and the length of the hill. May I suggest that, if Mr. Feeny would choose K equal to 200, then he is not a suitable person to select constants for formulæ; of course, I do not mean this seriously, but I just want to show how ridiculous it is to make comparisons based on entirely incorrect assumptions.

In your interesting article on formula on another page you point out that the time factor depends on the average speed of the machines, which is yet another argument in favour of my formula. Again, your contributors both talk about big differences, but, considering the differences on my formula are *actually less than those with the old formula*, I think that this statement will speak for itself. The results on my formula are distinctly interesting, and if they are plotted against calculated horse-power they provide some most valuable data. On the old formula Morgan machines would have won all through; but, in spite of the excellence of this make, I do not think that it can be denied that the order of relative merit as seen from the formula used is perfectly just. It is ridiculous in the extreme to use the same formula for long hills as for short, so that the time factor is allowed to control absolutely everything, and it is equally absurd to neglect the fact that a small capacity engine making not such a very much slower climb than one of more than double the capacity certainly deserves to score on formula.

I must honestly say that as the comments appearing on this subject are based on absolutely wrong figures it is only to be expected that they would be somewhat wide of the mark, and their writers are more than justified in drawing attention to this fact. Apart from this, they provide very excellent proof of the correctness of my formula.

A. W. LOW, A.C.G.I., D.Sc., ETC.



THE MOTOR CYCLIST RESERVE.

THE recent *communiqué* from the War Office, published in *The Motor Cycle* a few issues ago, roughly outlined the scheme under which motor cyclists may join the army, but we are now enabled to give details regarding the matter.

As regards the London district, officers have been appointed to form the Motor Cyclist Reserve Committee.

Alternatives.

There are two schemes under which motor cyclists may serve their country.

Class I.—Motor cyclists required for duty with units of the Army Signal Service, Expeditionary Force.

Class II.—Motor cyclists required for service with units of the Territorial Force. While, in addition to the above, a motor cyclists' section (special reserve) has been formed of the Royal Engineers.

Before going into details representing each of these three classes, it is necessary to deal with the matter generally. In order to provide the necessary organisation for finding the *personnel* required, it has been decided to form committees in the different commands in Great Britain and Ireland.

Twelve committees will be formed, one in each Territorial Divisional Area in England and Wales. In Scotland there will be three committees. In Ireland two committees will be formed. The committees are to be composed of one or more military officers appointed by the general officer commanding-in-chief, preference being given where possible to officers having a knowledge of motor cycles; representatives of the principal motor cycle unions or associations in the districts, and, where necessary, representatives of the county associations. A military member and representative of a county association (if serving) will act as joint secretaries.

Special Requirements.

Candidates desirous of joining must have their motor cycles inspected and fill in the required certificate on an Army form. The certificate will then be passed in the case of a candidate for the Special Reserve to the officer in charge of the Royal Engineer Records, and in the case of a candidate for the Territorial Force to an officer of the Territorial Force Association of the committee. In the case of a special reservist the candidate must be medically examined.

As regards the Royal Engineers, Special Reserve, Motor Cyclist Section, the following arrangements have been approved.

In peace each detachment is attached to a unit of the Army Signal Service. For the purpose of administration and mobilisation the Motor Cyclist Section will be under the officer in command of the Royal Engineer Records. Officers will not be promoted above the rank of lieutenant.

Terms of Service.

The conditions and terms of service for officers will be similar to those laid down for Royal Engineers, Special Reserve. Their probationary training will consist of fifteen days' continuous training, to include pistol exercises and practices, with the regular signal unit to which they are attached. The annual training will consist of fifteen consecutive days' training, while officers may, in addition, with their own consent, be employed on military duty with the unit to which they are attached, or with any regular Special Reserve or Territorial Force unit. The officers will wear uniform of the Royal Engineers' pattern, and, in addition, will provide themselves with drab waterproof overalls, brown gauntlets, and goggles of a suitable description for use with motor cycles. They will be armed and equipped as mounted officers of the Royal Engineers with the exception of sword, saddlery, and spurs. The pay during training for special service will be the same as an officer in their rank in the Royal Engineers, Special Reserve. They will also draw the motor cycle allowance and travelling allowance under certain conditions. A certificate of proficiency at their trade will be required of men before their enlistment to fill vacancies as motor cycle artificer-corporals. Recruit training will be not less than seven nor more than fifteen days' continuous training. The annual training will be the same as for officers. Non-commissioned officers of the Motor Cyclists' Section, when training or on special service, will draw the same allowance as non-commissioned officers of corresponding rank in other branches of the Royal Engineers. Motor cycle artificer-corporals will receive pay at the rate of three shillings per day.

Expenses.

To cover the cost of petrol and wear and tear, and all liability for damage, an allowance of 8s. per day will be granted. Travelling allowance: Motor cyclists when joining for annual training or other military duty will, if they proceed by motor cycle, receive an allowance at the rate of 1½d. per mile, provided they travel by the shortest route and that the allowance does not exceed the expenses, first-class for officers and third-class for a man, which would have been incurred had they proceeded with their motor cycles by rail. Officers and other ranks will be required to submit their motor cycles for inspection before being permitted to join the Motor Cyclists' Section of the Royal Engineers, Special Reserve, and a further annual inspection will be carried out in the spring of each year. These inspections will be arranged for by the Motor Cyclist Reserve Committee of the district in which the motor cyclist resides. Penalties have been instituted for those who fail to turn up for inspection with their machines, or if the machines are not in a serviceable condition when inspected.

Mobilisation.

On receiving an order to mobilise, motor cyclists will report where ordered, bringing with them their machines fully equipped. Each motor cycle will then be inspected by the officer to whom the motor cyclist has had orders to report himself, who may take it over at a valuation or replace it by a new one. The motor cyclist must state the original price of the machine and the date of purchase, and produce a receipt, etc. On the motor cycle being taken over by the Government a reduction of 10% of the original cost will be made for the first year since purchase, and a further reduction of the original cost for each subsequent half-year or part thereof. The price paid will not be less than 30% of the original cost of the motor cycle.

Half the above equipment will be provided by the War Department and the rest must be provided by the motor cyclist himself.

Types of Machine.

Motor cycles must be of a well-tried and approved make, of which adequate stocks of spare parts are available in the country. They must be fitted with variable speed gear and magneto ignition. The wheels must be 26in. in diameter, with not less than 2¼in. tyres, for machines with engines of 500 c.c., and not less than 2in. tyres for machines with engines of 350 c.c. Engines to be single-cylinder of about 500 c.c., with dimensions of not less than 84 mm. bore and 84 mm. stroke. A certain number of horizontal twin-cylinder machines will be accepted. The magneto must be efficiently protected from the wet, and preferably of the waterproof type. The magnetos should, where possible, have interchangeable base and drive. Spring forks must be fitted, and the screw threads used should be standardised as far as possible. Lamps and generator to be fitted with brackets

The Motor Cyclist Reserve.—

for attachment to the machines. If a belt is used it should have the standard angle and section of ⅞in. or 1in. Spare parts must be carried, and the machine must be fitted with a suitable valise or bag for carrying personal kit. The machines must be effectively silenced.

The list of spare parts to be carried for annual training is as follows:

One valve, complete with spring, washer, and cotter.
One sparking plug.
Tyre repair outfit, including spares for valve.
Spare inner tube.
Spare belt and fasteners if belt-driven.
Spare links if chain-driven.
Selection of nuts and washers.
Two valve cap washers.
Any special spare parts required for particular type of machine.
Complete set of tools.

Two gaiters for tyre repair, and, when on war service, a complete set of spares for magneto and spare chain where chain-driven. A spare outer tyre cover for each motor cycle will be carried by signal units.

Arrangement of Detachments.

With regard to Class 1, the section will in peace be formed in detachments attached to a unit of Army Signal Service.

As regards Class 2, recruits on final approval will at once be appointed lance-corporals (unpaid), and will be eligible for subsequent promotion to the rank of corporal and sergeant.

The regulations for the Territorial Force as applied to the arm of service into which the motor cyclists are enlisted will apply to them with the following modifications:

Recruit drills will be confined to twenty drills, including pistol exercises and practices.

Annual drills will be confined to the annual course in pistol practice

Motor cyclists will be armed with a pistol, and equipped with a brown leather belt, holster and pouch.

Motor cyclists will be allowed 8s. a day during training or other special duty, but not during drills.

In aid of the cost of conveyance to and from the place of annual training, the following grants are made:

	s.	d.
For motor cycles, not exceeding 12 miles ...	1	0
Exceeding 12 but not exceeding 25 miles ...	1	6
Exceeding 25 but not exceeding 50 miles ...	2	0
Exceeding 50 but not exceeding 75 miles ...	3	0
Exceeding 75 but not exceeding 100 miles ...	4	0
For each additional 50 miles or portion thereof	1	0

Motor cyclist artificer lance-corporals will be paid in the following way:

	s.	d.
Yeomanry and Royal Engineers	2	0
Cyclist Battalions	1	9

Territorial Motor Cyclists.

During peace motor cyclists will be required to provide and maintain their machines in order, and on joining must present their machines for inspection. Motor cyclists on coming up for annual training will be required to produce their machines in a serviceable condition. The same arrangements exist as regards the valuation of motor cycles and providing new ones.

The establishment of motor cyclists allotted to units of the Territorial Force is interesting. It is arranged as follows:

Regiments of Yeomanry allotted to mounted brigades	8
Divisional Telegraph Company	8
Wireless	4
Cable	5
Air-line	3
Cyclist Battalion	17

The regulations with regard to the standardisation of motor cycles are the same as for the Royal Engineers' (Special Reserve) Motor Cyclist Section, except that motor cyclists of the Territorial Force may join with machines of twin-cylinders and with greater capacity. The list of spares are the same, except that a piston ring must form part of the equipment. Motor cyclists are to be supplied with thirty-six rounds of ball ammunition, the allowance for practice being a hundred rounds for the first year and fifty for the second.

Suggested Coventry Testing Track.

A MOVEMENT has been set on foot in Coventry by a committee of the Motor Cycle Manufacturers' Union to bring into being a track for the general use of the trade. It is proposed that the track be constructed about forty feet wide and to the scale of one mile to the lap, and that it be entirely managed and used for the benefit of the various companies engaged in the manufacture of motor vehicles.

It is not intended to use the proposed track in any way for racing, nor is it at present proposed to construct it for public use. Therefore, the movement is of no direct interest to the motor cyclist of the "nut" variety. But we need hardly point out that such a scheme would ultimately prove of enormous benefit to the great body of motor cyclists.

At the present time it is necessary for a firm situated in the Midlands, where the majority of motor cycle manufacturers are to be found, to adopt one of two methods for trying out any new ideas they wish to incorporate in their models. One is to go to great expense by utilising Brooklands, which is too far from their base of operations, the other to put the material under trial into the hands of their testers and allow them to take it out on to the public roads, and act eventually on the information which can be gleaned from their reports.

The Difficulty of Adequate Testing.

Given a really capable, conscientious tester, this method is satisfactory, but such testers are not to be found in abundance, and each factory may count itself lucky if it possess one such Admirable Crichton. The test cannot always, under such conditions, be carried out under the eye of the works manager or designer, and the presence of such a testing track as proposed would be perfectly ideal for the purpose of the acquisition of knowledge about any alteration of design. Each firm would have its own little depot on the track, and the testers would be immediately under the eye and control of a responsible official deputed by the factory for that purpose. Such a plan would also free the Midland roads of a swarm of motor cycles which, to speak plainly, are not invariably ridden with all the care they might be. The comparative absence of accidents in the Coventry, Birmingham, and Wolverhampton districts is probably due more to the wonderfully clever handling of the machines by the testers than to the fact that any great care is shown.

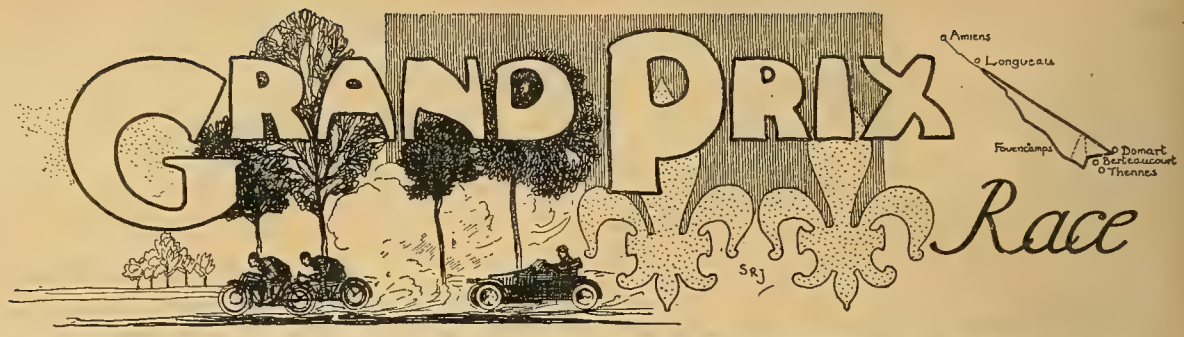
The Financial Aspect.

A great saving of time in placing new ideas in the hands of the riding public would be effected if the tests could be carried out on a special track, and the small inventor would have a far rosier chance of his ideas being tested if the trial could be made quickly under the superintendent's eyes on the testing track.

The financial aspect in this project is, as in most other schemes, the crucial matter. We understand that about £20,000 would be required to launch the scheme satisfactorily. It is proposed to form a limited company, the shares to be subscribed by interested manufacturers. Those using the track would, of course, pay a *pro rata* sum according to the number of machines which were tested. Provided these matters can be fairly adjusted, and a suitable site secured, there is little doubt that such a project would be to the ultimate benefit of both the manufacturer and the private user.

A similar project is on foot in Wolverhampton, two schemes having been suggested, one similar to the proposal at Coventry, at an estimated cost of £13,000, and a more ambitious idea on the lines of Brooklands to cost about £150,000, where, of course, race meetings and competitions would be held.

The GRAND PRIX Race



The Grand Prix races were run off on Sunday last on the triangular course near Amiens. The feature of the day's racing was the overwhelming victory of the British machines and riders. In the 500 c.c. class the success of our products was extraordinarily complete, the French only getting one machine home among the first eight. In the class for sidecars and cycle cars, a British victory was also achieved, while in the motor cycle class for machines not exceeding 350 c.c., Britain was fourth but the winning French machine in this class was ridden by an Englishman.

Length of course: 10·86 miles { Motor Cycles: 20 laps = 217·2 miles. Sidecars and Cycle Cars: 15 laps = 163 miles.

THE preliminary stages of the race proper began on Friday last when the weighing and examination of machines took place. The Grand Prix cars, as well as the motor cycles, were attended to, consequently there was a big crowd present. Racing is done thoroughly well in France. Several fields were specially chartered, in which were erected special lock-up cages for the machines, a telegraph office, telephones, tents, restaurants, lavatories, and four big stands.

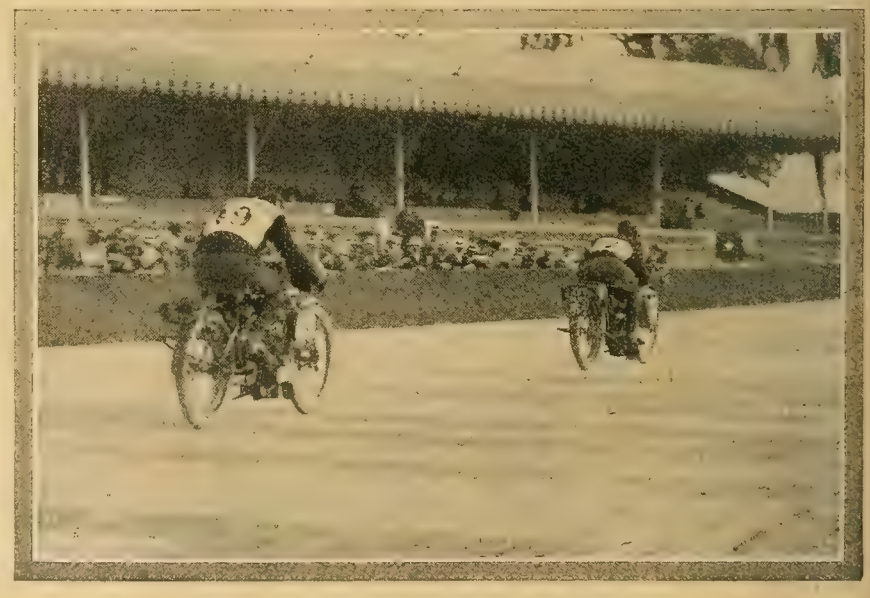
In front of the stands a special road of concrete surface had been made, and depots for replenishment arranged immediately in front.

The chief trouble in the inspection of the motor cycles was the removal of cylinders to check bore and stroke, but all were found according to entry, and weights were added in the case of those not up to the minimum. Several late arrivals duly reported themselves, including Esser and his Mathis, Mundy's Morgan propelled by a twin Green-Precision engine, and Nash's G.N., the trio of Triumphs, and Alexander's Douglas all these not having practised on the course. Paul (Clément) that morning suffered a bad fall owing to taking his hands off the bars to show a friend how easily his machine steered. Harry Reed was using a Swiss engine, and had the misfortune to damage the timing gear, and he was unable to get spares in time. The competing machines looked a workmanlike lot, and gave promise of a good race. The four-cylinder Marlborough had some difficulty in getting within the weight limit.

START OF THE RACE.

The motor cycle race started at 6 a.m. in glorious weather. Both classes were sent off together in groups of four. The French have clearly done us the compliment of following as far as possible the Auto Cycle Union system of organising the start of a motor cycle race. Each man wore a coloured waistcoat with his number on the back. These were the international colours: England, green; France, blue; Switzerland, red. There was not quite the same perfect order as at Douglas, but the organisation was good, and there is no doubt that such experienced officials as the Chevalier René de Knyff, Comte de Clerc, and M. Longuemare certainly handled the start well. Most got away in good style. From the press stand one got a splendid view of the start and the first half-mile of the course. The cornering, too, at each end of the connecting "legs" of the course, which is cemented and banked slightly, was most interesting to watch. The interior is banked with a cinder heap of coal slack so that in case of accident practically no damage can ensue. Each "leg" of the triangular course (17.50 kilometres) is in good order and has not suffered much from the car race. That on the north is best, but the westerly connecting road is narrow and not too smooth, and the corners at each end are bad. As regards the home stretch the turns entering and leaving Boves are tricky, and the surface in the village very rough. After all the riders had been despatched Alexander (Douglas), first to appear, took the bend without cutting out, a performance which few others dared emulate. In fact the cars found these corners far more difficult than the motor cycles. Dacier (Alcyon) came by slowly, followed by a group who were travelling well, consisting of Kickham (Douglas), Fenton (Clément), Vulliamy (Motosacoche), Fenn (B.S.A.), Ball (Douglas), and Millaud (Motosacoche). Griffith (Zenith) then appeared, passing Lamb opposite the stands. Pélissier then came in to effect an adjustment to his magneto. Cisey (N.S.U.) had a narrow escape from a fall, Lehmann (Alcyon) and Cuzeau (Terrot) stopped through tyre troubles. Dacier's Alcyon was squeaking somewhat as it passed the Tribunes.

When the times were put up it was seen that Fenton (Clément) was leading in the 350 c.c. class, and Lavanchy (Motosacoche) at the head of the 500 c.c. riders. Fenton had averaged 87.500 kilometres an hour. As soon as the first lap times were posted there was made an anouncement that the leaders' times only would be published and the number of laps accomplished by the others. It is interesting to note that the arrival of each competitor was announced by soldiers mounted on a watch tower by means of a bugle.



A. G. Fenn (B.S.A.) and Baudry (Griffon) passing the stands.

A. R. Abbott (Rudge) and A. Clayton (Triumph) passing through Boves. The roads were very uneven hereabouts.

The first lap order and times were as follow:

350 c.c. Class.

		m.	s.
1.	Fenton (Clément)	12	41
2.	Vulliamy (Motosacoche) ...	12	47
3.	Alexander (Douglas)	13	28

500 c.c. Class.

1.	Lavanchy (Motosacoche) ...	12	14
2.	Perrin (Peugeot)	12	22
3.	Sproston (Clément)	12	35

In the 350 c.c. class, Ball (Douglas) was running sixth and Kickham (Douglas) ninth. In the 500 c.c. class, Greene (Rudge) was fourth, Abbott (Rudge) fifth, Ravelli (Premier) sixth, and Cheshire (Triumph) seventh. On his third lap, Péan, the hope of the Peugeot team, had his front wheel come adrift at the corner, which, of course, threw him, but without causing damage to himself. Naturally, after this he retired. The cause of this trouble was a broken spindle. Cisey, who had a narrow shave from falling on his first lap, managed to tumble properly on his fourth, this time at the left-hand corner near the grand stand. Sproston (Clément), who held a leading position, unfortunately broke a chain. Lavanchy up to his sixth lap had averaged 87 kilometres an hour. Abbott was soon again in trouble with his tyres, and stopped opposite the depôt and took his wheel out. Lehmann (Alcyon) also had tyre troubles. Lamb, the Premier rider, who had taken Holloway's place, suffered a burst tank. In the fifth lap the order stood as below:

At quarter distance.

350 c.c. Class.

		h.	m.	s.
1.	Fenton (Clément)	1	5	22
2.	Royer (Clément)	1	7	3
3.	Vulliamy (Motosacoche) ...	1	7	39

500 c.c. Class.

1.	Lavanchy (Motosacoche) ...	1	0	51
2.	Greene (Rudge)	1	4	44
3.	Cheshire (Triumph) ...	1	5	13

Of the other English competitors in the small class, Ball (Douglas) was sixth, Alexander seventh, and Kickham eighth. In the 500 c.c. class, Fenn (B.S.A.) was fifth, Woodhouse sixth, and Isodi seventh, also on B.S.A.s; Clayton (Triumph) was eighth. Griffith (Zenith), Newsome (Triumph), and Darmont (Zenith) were low down in the list.

During the racing several aeroplane pilots soared above the course, and executed some splendid flights. Rowlandson (Rudge) stopped several times owing to plug and valve troubles, while Lavanchy (whose splendidly running Motosacoche appeared to be bringing him to certain victory) suddenly developed valve gear trouble, and though he worked hard and long before the depots he ultimately had to give up the race.

An interested spectator, who is still tremendously keen on motor cycle racing, though he no longer rides a two-wheeler, was the Austrian, Count Kolowrat. He spent a long time conversing with Davis, the Douglas agent in Paris, and was talking of buying an engine from him to put in a cycle car.

When the tenth lap times were published Fenton was again well ahead, and the following was the order of the leaders; but in the 500 c.c. class Greene (Rudge) was now leading:

350 c.c. Class.

		h.	m.	s.
1.	G. Fenton (Clément) ...	2	10	44
2.	Vulliamy (Motosacoche) ...	2	17	11
3.	Millaud (Motosacoche) ...	2	19	22

500 c.c. Class.

1.	Greene (Rudge)	2	10	17
2.	Vulliamy (Motosacoche) ...	2	17	11
3.	Perrin (Peugeot)	2	13	33

In the 350 c.c. class, Ball (Douglas) was running fourth, and Kickham sixth. In the large class, Cheshire took fourth

J. W. Woodhouse (B.S.A.) overtaking Millaud (Motosacoche) at the right angle turn at Tracy.

Sproston (Clement), Ravelli (Premier), and Franquebalme (Terrot) racing past the grand stand.

place, Clayton (Triumph) fifth, and Sproston (Clément) sixth. Fenn (B.S.A.) dropped back to seventh place, while Rowlandson was running eleventh and Newsome twelfth.

Tyre troubles were pretty frequent. Newsome started quite early with this exasperating type of *panne*, and changed his cover. Fenn, who had been running well in the early part of the race, and appeared to have a good chance of winning, twice had to change a valve owing to loss of compression. Alexander had to retire owing to valve trouble; he was also suffering from difficulty with a new type of adjustable pulley, which continually caused the belt to bottom. By the time the fifteenth lap times were published a good many men had fallen out, and among those reported as retired were Alexander, Loubier (Debeaune), Naas (Griffon), and the ill-fated Lavanchy. The following table shows the progress of the race at the end of the fifteenth lap:

350 c.c. Class.

		h.	m.	s.
1.	Fenton (Clément) ...	3	18	57
2.	Vulliamy (Motosacoche) ...	3	25	59
3.	Millaud (Motosacoche) ...	3	30	13

500 c.c. Class.

1.	Greene (Rudge)	3	16	49
2.	Fenn (B.S.A.)	3	22	5
3.	Cheshire (Triumph) ...	3	22	23

As regards the other English competitors in this lap, Clayton (Triumph) was fourth, Isodi, who, though French, was riding a B.S.A., 5th, Abbott (Rudge) 6th, Woodhouse (B.S.A.) 8th, and Rowlandson (Rudge) 9th. It was drawing near the end now, and though the English machines were quite out of the running in the 350 class they were doing exceedingly well in the 500 category.

Fenton, who had completed the course with only one stop, ran along the special track at the finish after his magnificent ride, but Greene, who had not been signalled to and did not know the ropes, pulled up at the depot. It was a fine race, keenly contested, and a great British triumph.

Result.

350 c.c. Class.

		h.	m.	s.
1.	Fenton (Clément)	4	27	41
2.	Millaud (Motosacoche) ...	4	38	0
3.	Vulliamy (Motosacoche) ...	4	41	31
4.	Ball (Douglas)	4	54	56
5.	Verpault (Terrot)	5	2	25

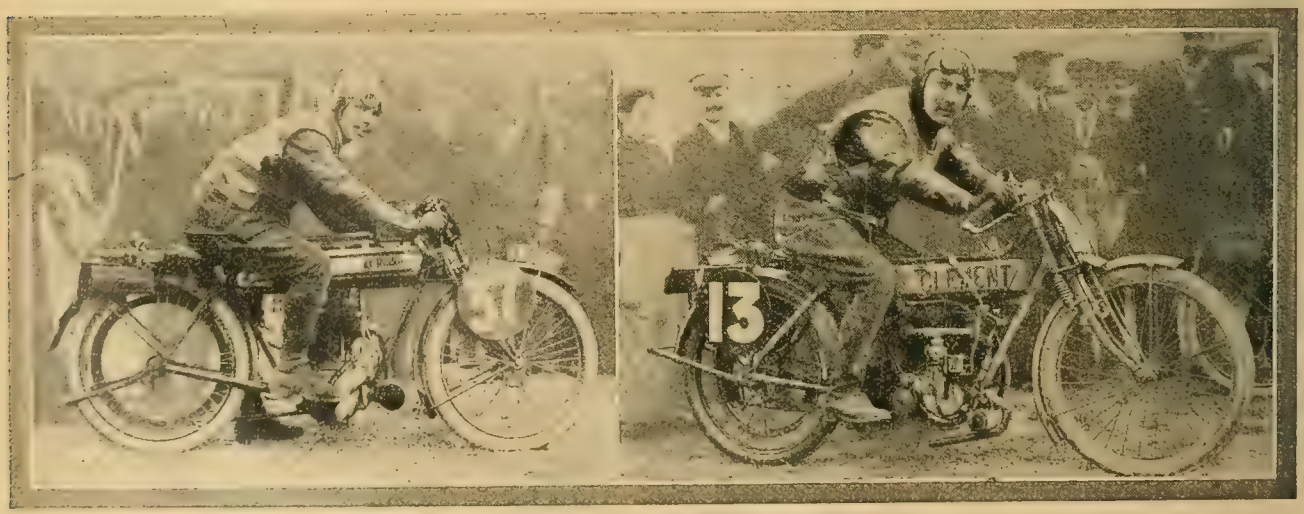
500 c.c. Class.

1.	Green (Rudge)	4	22	55
2.	Cheshire (Triumph) ...	4	26	29
3.	Fenn (B.S.A.)	4	30	58
	Clayton (Triumph) ...	4	34	5
	Perrin (Peugeot)	4	41	9
	Isodi (B.S.A.)	4	45	19
	Abbott (Rudge)	4	59	4
	Rowlandson (Rudge) ...	5	2	23
	Cisey (N.S.U.)	5	10	0
	Baudry (Griffon)	5	13	55
	Newsome (Triumph) ...	5	19	16
	Griffith (Zenith)	5	25	42

Woodhouse (B.S.A.), who was well up in the sixteenth lap had to retire owing to a broken piston ring. Sproston's withdrawal was caused by a broken valve.

The riders had not impressed the spectators by their speed capabilities, about a mile a minute seeming to represent the best top speed of any competitor, which is difficult to explain as the roads generally were excellent and quite straight, and owing to the absence of hills a high gear was used by most riders. Some put it down to the heat. It should be added that the 350 c.c. machines were up to their usual form.

The first five riders in order of speed were British.



THE TWO WINNERS IN THE GRAND PRIX MOTOR CYCLE RACE.

(1) T. E. Greene (3½ h.p. Rudge), leader of Class II. for 500 c.c. machines. (2) Greame Fenton (2¾ h.p. Clement), winner of Class I. and third fastest of the day.

Isodi (B.S.A.) at speed.

IN THE DEPOT.

The replenishment depot is the spot for incidents during a race, and in the French Grand Prix one can see everything and follow the race closely, as the scoring board is arranged immediately behind the pits from which the attendants handed competitors all they require. Newsome was amongst the first to stop, reporting a burst tyre, as a result of which he was hurled into the ditch. He took the precaution to change. The course being so short, the riders were continually round, and the trumpeter had quite a busy time announcing by continual blasts the approach of a competitor. Péan (Peugeot) and Lavanchy were very fast, but the surprise of the day was Greame Fenton's Clément, with M.A.G. twin engine, which ran splendidly. Alexander, who started first, was going strong, and kept his lead for a few laps, when trouble assailed him. It appears that he was using a new adjustable pulley, which continually opened out and lowered the gear considerably and caused his belt to slip. Punctures were a bugbear; several had to stop for spare tubes. There had been talk overnight of steel studs being scattered over the course from the car races of the Saturday. Péan's spill near the grand stand owing to a broken front spindle might have been more disastrous; it was very bad luck, seeing that his new side by side valve twin Peugeot was pulling splendidly.

French Methods of Riding.

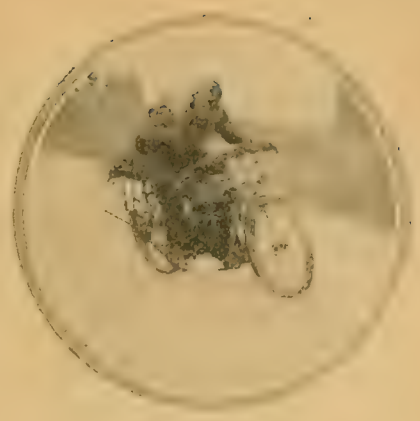
Some of the French riders adopted queer attitudes—one foot on the pedal and one on the footrest was quite usual. They showed signs of excitement on the corners, when they often used their feet to brake instead of the brake pedal. Several times three or four would pass the depot in a bunch. In one of these Clayton (Triumph) showed up well. Greene, the ultimate winner, stopped on his seventh lap for petrol and oil, and the next time round led from Fenton by half a minute. The speed of the 350 c.c. Clément was the talk of the day, and more than one quaked lest it should head the 500 c.c. machines.

The Frenchmen were taking the race very seriously, and practically all had a system of signalling to and from their attendants. Griffith was riding steadily on the Zenith, but had to stop for oil and also changed a belt. He complained of his engine drying up on the level. Lavanchy (Motosacoche), who won the last French race, was in trouble, for his engine would only fire on one cylinder. He shook his head ruefully as he overhauled each part in an endeavour to right matters. Abbott's Rudge did not appear up to his usual form—he told us it varied in speed most unaccountably. Rowlandson had to change his plug more than once. Gradually Greene (Rudge) drew away from Fenton, but the latter, who resides in France, was a great favourite and always came in for a cheer from the crowd. The B.S.A.'s and Triumphs were close on their heels, and only one stop was wanted to alter all the positions. Fenn replaced an exhaust valve in the depot. Woodhouse (B.S.A.) and Cheshire (Triumph) in particular were riding in promising style; 3m. 25s. separated Greene and Fenton at the completion of the fourteenth lap. Vulliamy (Motosacoche) had, however, crept nearer to Fenton, but still had 6m. leeway to make up. The crowd was much larger towards the finish, and it was now plain that a decisive British victory would be the outcome.

Timing gear trouble caused Pelissier's (Motosacoche) retirement. The positions were little altered in the later stages. At the seventh lap three minutes only separated the leaders of 350 c.c. and 500 c.c. classes. Both got a cheer as they entered upon their last lap, Fenton getting home first, Greene half a mile behind, though actually faster time, as he started after Fenton.

THE WINNERS.

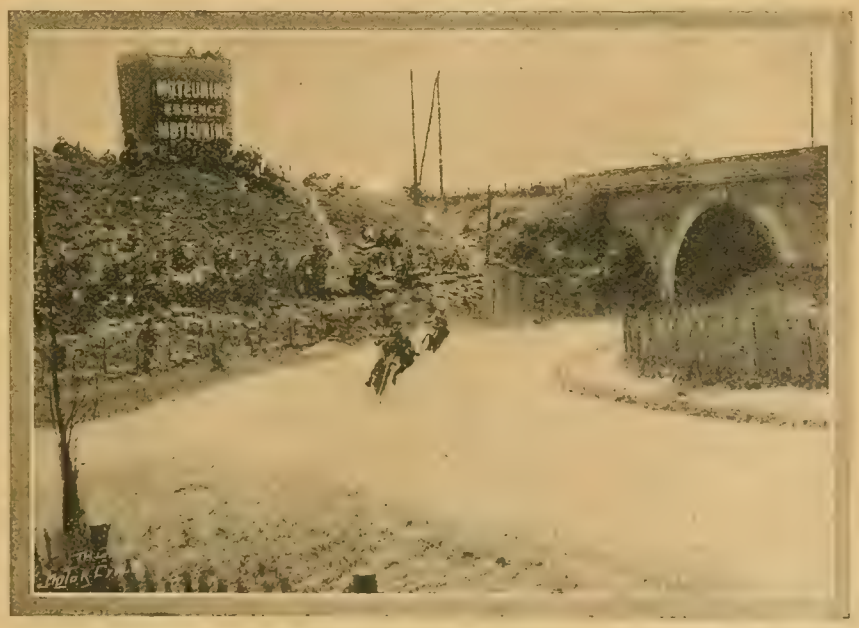
The winner of the 500 c.c. class, Thomas E. Greene, of Dublin, rode in the T.T. He enjoyed a non-stop run throughout, and stopped twice only for petrol and oil. His T.T. Rudge had a 4 to 1 fixed gear. Asked what he thought of the course, he replied that he considered the corners at the end of the by-road were most trying. The bumpy road surfaces—in Boves, for



Greame Fenton, an English rider of a Clement-M.A.G. rounding a bend.

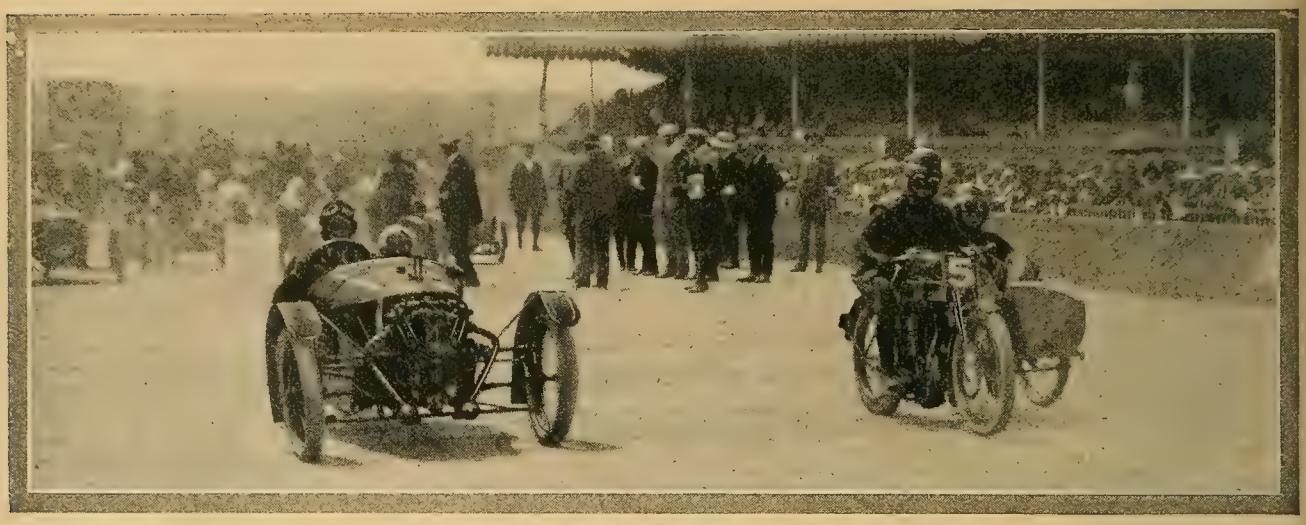
instance—he continued, did not concern him, as he is so accustomed to the rough roads of Ireland. His ride was devoid of incident, though he told us of several "scraps" he had with fellow competitors.

Greame Fenton is an Englishman by birth, but has lived in France many years, his father being a manager of the Clément-Gladiator Company. Like Greene, Fenton had no occasion to stop throughout the run, and only pulled up once for petrol and oil. He was able to pass several 500 c.c. machines in speed bursts, his twin Clément running faultlessly throughout. On his last lap the high speed chain broke and disappeared, but he had such a comfortable lead that he was able to continue on the lower ratio for the last five miles, the ratio being such that the Clements were capable of 45 m.p.h. on the low. Fenton used a new Longuemare handlebar controlled carburetter with adjustable jet. He made use of the latter for rapid acceleration at the start, and spoke very highly of the carburetter generally.



The bridge and S bend near Boves showing two competitors about to commence to climb the steepest hill on the course—about 1 in 16 gradient.

The Sidecar and Cycle Car Race.



AT THE START OF THE SIDECAR AND CYCLE CAR RACE.
W. G. McMinnies (Morgan Runabout) and Touchet (Regal-Green sidecar) get away together. The former won his class, and made the fastest time of all the passenger machines.

The passenger motor cycles were started at noon in a broiling sun. Frank Smith was a notable absentee owing to throat and chest troubles, and Messervy's place was taken by de Peyrecave. There were a number of other non-starters. There was a lot of interest taken in the little machines. The cycle cars outnumbered the sidecars 4 to 1, and, unfortunately, neither class had a really representative British entry. The first trio away caused great amusement by the passengers immediately clambering over the carriers to assist in cornering, whilst several passengers pushed and sprang over the back like cats. The foreign journalists in our vicinity yelled with delight as each group were given the word to go and crawled off the line. Bonville stopped his engine. There was a splendid view of a straight half-mile from the grandstand, and it was noticed that a B.S.A. sc. led the first batch, whilst the three water-cooled Morgans in particular accelerated very rapidly. Barnes (8 Zenith sc.) started with a René Gillet and left a trail of smoke to guide the driver of the latter. Hawkes's passenger pushed the Dew cycle car and then jumped aboard; whilst the sight of three tandem seaters crawling off the line raised another derisive laugh. Once under way, however, they went well. Sidecar and cycle car racing was something entirely new to the crowd, and they seemed to enjoy the gymnastic methods of cornering, and screamed when two passengers on different vehicles leaned outwards instead of inwards to keep the inside wheel down. The long, racy-looking Automobilette was slow off the mark, but once on the move showed a real turn of speed. The last pair, Sphinx and Bogey, kept practically together until out of sight.

A few minutes' wait, and McMinnies turned up, cornering fast, thanks to the low build and wide track of his Morgan. A minute later and another Morgan, Mundy up, appeared. He took the first corner wide at about 35 m.p.h. and the offside front wheel was seen practically to double up under the strain. At the second bend it was on the point of collapsing, but Mundy managed to pull up safely. This was a quick finish to a third fastest lap and unfortunate, as a new Green-Precision V-type engine was being used for the first time. It pulled finely. Bourbeau's Bedelia had made a good circuit, also the smart-looking Mathis with its white and red coating. The Marlborough carried the only lady passenger, and she soon became a favourite and was cheered every circuit. Nash's G.N. was second fastest. There was some consternation at the non-appearance of H. F. S. Morgan, due, it was subsequently learned, to the breakage of a connecting rod but three miles from the start. A Violet, dexterously driven by the designer and maker, surprised many by its speed. A single-cylinder air-cooled Globe was new to competition work and got along at a fine bat.

A Sidecar Leads the Field.

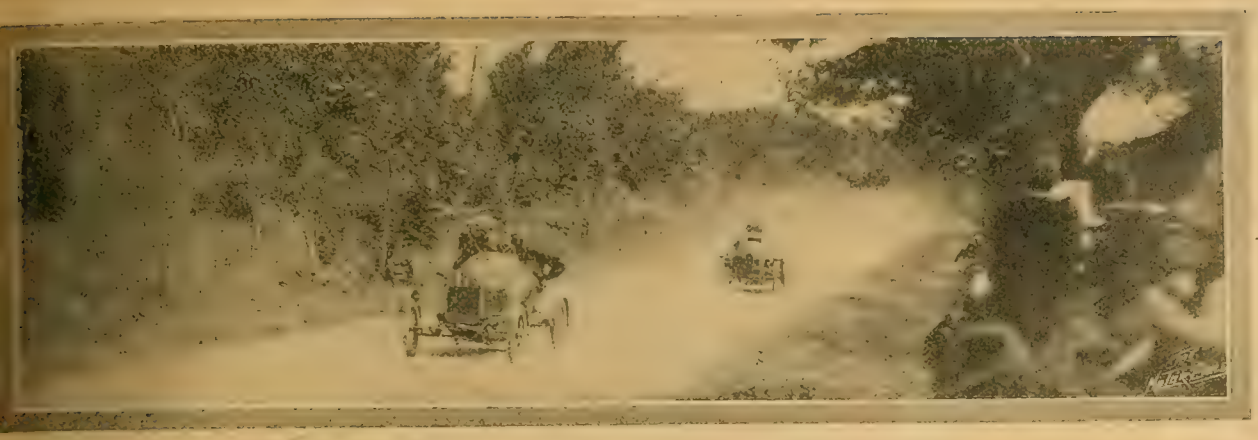
There was a wait ere the leaders on the second lap appeared, when it was seen that Touchet (Regal-Green) was leading McMinnies by threequarters of a mile, the latter having had to change a plug. The Ronteix, like the Mathis and Marlborough, has a four-cylinder engine, and is, in fact, a car in miniature. Francis (Duo) skilfully shot past Nash (G.N.), who had stopped on the corner to dispense with the bonnet. This, however, was not permissible, and the officials called him back. He stopped again in a hundred yards owing to misfiring. Esser (Mathis) steered the larger Grand Prix car the day previously, and much was expected of him. His engine emitted a fine buzz. The Marlborough was improving, but already intervals were occurring. Touchet (Regal-Green) increased his second lap lead, and was apparently the fastest sidecarist, excepting Barnes (Zenith). The latter was missing in the second lap due, it was subsequently learned, to engine troubles. Five riders had only done one lap when the leaders finished three. The Ronteix drives on to a single wheel by chain, and we were interested to observe that there was no apparent difference in cornering or speed. The Marlborough driver treated the spectators to an interesting exhibition when it passed two French cycle cars at speed. McMinnies came in very late, and stopped for a spare tube, his front tyre having picked up a nail, notwithstanding that he used an 80 mm. section. When Nash (G.N.) next appeared his passenger was carrying the engine bonnet under his arm.

On the third lap a friction-driven Violet-Bogey led, with two Bedelias in close attendance, and the Regal-Green sidecar fourth. Samuelson (Marlborough) stopped for water, his engine having boiled the radiator almost empty. Three trumpet calls announced the approach of competitors, and there was quite a fight for the leading position, with the Regal-Green sandwiched between two Bedelias.

On the completion of the fourth lap the order and times of both classes were:

		m.	s.
1.	Bonville (Bedelia)	61	39
2.	Esser (Mathis)	62	35
3.	Samuelson (Marlborough) ...	63	28
4.	Touchet (Regal-Green) ...	63	34
5.	Canouel (Sphinx-Globe) ...	63	49
6.	Violet (Violet-Bogey) ...	65	35

Two cycle cars close up were Peyrecave's Duo and Leveque's Super. Both were running very steadily, and their drivers took no risks. The Dew passed with the tail end considerably sagged. It was withdrawn later with a broken tie rod. Ronteix stopped a few seconds to pick up an oil gun. Samuelson again stopped for water, and his fair passenger was noticed drying her smarting face, boiling water having spurted through



Violet on the Violet-Bogey and C. M. Whitehead (G.N.) at speed along the home straight.

ne radiator owing to the loss of the filler
p. After improvising another cap and
plenishing, he was away again, a
ghty cheer lending encouragement.

Sixth Lap Leaders.

Peyrecave (Duo) easily beat the
.S.U. sidecar, whilst Bonville (Bedelia)
xecuted a dangerous swerve in corner-
ng. The race was interesting to watch,
s it was of such an open character, and
ne vehicles so new to speed work.
here was little change among the
aders, however:

	h.	m.	s.
. Bonville (Bedelia)... ...	1	31	48
. Esser (Mathis)	1	33	10
. Violet (Violet-Bogey) ...	1	34	34

Canouel (Sphinx-Globe), Ronteix, and
ouchet (Regal) followed in the order
med. McMinnies had now settled
wn again, and from the way he sped
own the straight stretch towards
loreuil promised to be among the leaders
n the end.

The Marlborough, now relieved of its
onnet, managed another lap without
topping for water. A puncture on the
Mathis caused a few minutes delay to
hange wheels. The Bedelia and Violet
drivers continued to fight out their duel,
and when Bonville dashed into control
and his excited helpers ran to him with
petrol and oil, they were promptly
ordered into the pit again. A little knot
of Englishmen were urging our men to
victory, and certainly they were putting
up a good fight despite their handicap
of a lack of knowledge of the course.
The passenger on Leveque's Super
actually replaced a belt which had jumped
off the pulleys while travelling along at
30 to 40 m.p.h.

Eighth Lap Positions.

		h.	m.	s.
1.	Bonville (Bedelia) ...	2	1	36
2.	Violet (Violet-Bogey) ...	2	3	2
3.	Ronteix (Ronteix)	2	6	46
4.	Esser (Mathis)	2	6	54
5.	Bourbeau (Bedelia) ...	2	8	44
6.	Leveque (Super)	2	12	38

The sidecars were faring badly, a René Gillet and B.S.A. retired, leaving but four in the running. McMinnies had gained the lead in this section and was now 11m. 13s. behind the leading four-wheeler with just over half the race to go. The Violet driver brought in a mudguard and handed it to an attendant, but it was promptly returned by an official to be carried on the car throughout. At this point eight competitors were officially reported retired. By the tenth lap the order was:

		h.	m.	s.
1.	Bonville (Bedelia) ...	2	31	35
2.	Violet (Violet-Bogey) ...	2	34	58
3.	McMinnies (Morgan) ...	2	41	14
4.	Bourbeau (Bedelia) ...	2	41	28
5.	Leveque (Super)	2	45	23
6.	De Peyrecave (Duo) ...	2	47	3

Now a curious incident occurred. Touchet (Regal-Green) was signalled to stop, and informed by an official that as a mudguard was noticed missing from his machine he must discontinue the race. Surely this was harsh ruling for a competitor lying second in his class. Why not have let him finish at any rate? Naturally, there was great discontent over this ruling, especially as the bumpy road surfaces had resulted in several cycle cars having shed their mudguards.

The Violet attendants were doing all in their power to urge their representatives on by signals and gestures. By this time the runners had dwindled down very considerably—only four in Class I. and nine in Class II. remaining.

Bonville lost his lead in this lap owing to his machine catching fire, his passenger being slightly burnt in stemming the flames.

Another view of the S bend, showing Bourbeau's winning Bedelia overtaking the Rene Gillet sidecar. There is a sharp bend to the left after passing under the bridge.

change of positions. The leaders on the twelfth lap stood as follows:

		h.	m.	s.
1.	Violet (Violet-Bogey) ...	3	2	50
2.	McMinnies (Morgan) ...	3	9	23
3.	Bourbeau (Bedelia) ...	3	10	48
4.	Canouel (Sphinx-Globe) ...	3	18	49
5.	De Peyrecave (Duo) ...	3	19	31
6.	Leveque (Super)	3	23	20

With luck the Morgan had a chance to overhaul the leader in the final laps, and after seeing the regular running of the car subsequent to the tyre trouble it was expected that McMinnies would finish first. Near the end he stopped for petrol and to secure a broken front tie rod. The Violet attendants overdid the signalling business, and when they excitedly jumped about as the last lap was entered upon the driver misunderstood their meaning, and actually stopped beyond the stand to enquire, losing quite a minute thereby, which unluckily lost him first place, Bourbeau beating him by 8s. McMinnies, on the Morgan, was first home and received a great cheer on registering the third British victory that day. Bourbeau followed a minute or two later. Meanwhile the stragglers, who had several laps still to cover, continued to career round the course, the final positions of the survivors being:

FINAL RESULT.

THREE-WHEELERS.

		h.	m.	s
1.	McMinnies (Morgan) ...	3	53	9
2.	Meuriot (René-Gillet) ...			
3.	Pellud (N.S.U.)			

CYCLE CARS.

1.	Bourbeau (Bedelia) ...	3	55	54
2.	Violet (Violet-Bogey) ...	3	56	2
3.	Canouel (Sphinx-Globe) ...	4	5	11
4.	Ronteix (Ronteix) ...	4	11	16
5.	De Peyrecave (Duo) ...	4	12	24
6.	Leveque (Super)	4	12	32
7.	Pouliez (Violet-Bogey) ...	4	16	47
8.	Esser (Mathis))	4	19	17
9.	Jolibois (Ronteix)	4	30	15

One of the four-cylinder Ronteix about to take a bend. There were two of this make in the race and both finished.

THE SIDECAR AND CYCLE CAR RACE FROM BOVES.

By means of a very fair by-road and aided by courteous and intelligent gendarmes, we reached Boves without difficulty, and arrived quite near the bridge, which is approached by the famous S bend. The René Gillet, like most of the sidecar machines, took the corner quietly, as also did a Duo. The Mathis came up fast, with a healthy buzz, and took the corner splendidly. The point where we were stationed was where Delpierre went over the bank on Saturday. This point was kept clear by soldiers and gendarmes, but the *brassard* given us by M. Longuemare on Friday worked wonders, and considerable assistance was rendered by a *caporal*, who understood English, and forthwith swore to become a subscriber to *The Motor Cycle* as soon as he knew we were connected with such a paper.

One of the Violet-Bogeys skidded as it turned. Nash came by going well, but his mechanic held the bonnet in his hand. The Super also skidded slightly as it took the bend. The Marlborough came round beautifully, and was heartily cheered, as it carried a lady as mechanician. The Dew came round with its occupants leaning well over. The next time the René Gillet sidecar came along we noticed the occupants were leaning out on the wrong side as it took the corner.

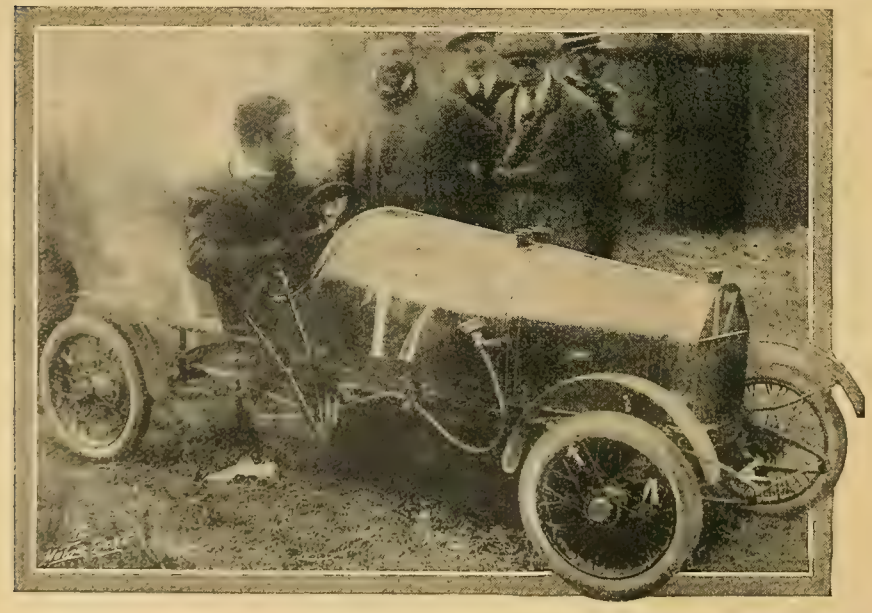
A little farther down the road we had a good impression of the cycle cars at speed. Nash came by at a good rate, waving his hand when he saw us. Bourbeau (Bedelia) was travelling well, and best of all as regards steady running was the Mathis, whose engine continued to give forth a healthy note.

THE WINNERS SPEEDS COMPARED.

It is instructive and interesting to compare the times of the winning machines in the motor cycle and cycle car races, taking the fifteenth lap times and speeds for the motor bicycles. We give them below:

OFFICIAL TIMES FOR FIFTEEN LAPS.

	h.	m.	s.	Average speed. m.p.h.
Fenton (2¾ Clément) ...	3	18	57	... 49.4
Green (3½ Rudge) ...	3	16	49	... 49.7
McMinnies (8 Morgan)	3	53	9	... 41.9
Bourbeau (8 Bedelia)	3	55	54	... 41.4



The friction-driven Violet Bogey, which finished eight seconds behind the Bedelia, but was disqualified owing to a mudguard coming adrift.

ACTUAL SPEEDS IN THE GRAND PRIX.

Times specially taken for "The Motor Cycle" by A. V. Ebblewhite and A. G. Reynolds.

The average speed in a race conveys little to the ordinary reader who does not know the corners and how much the pace was reduced to negotiate them, and for that reason we commissioned Messrs. A. V. Ebblewhite and A. G. Reynolds to take specially for *The Motor Cycle* the times over a kilometre on the fastest stretch of the course, viz., between the grand stand and the turning before Moreuil. The figures given below in order of merit form an interesting comparison both among the motor cycles alone and with the cycle cars. It will be observed that the opinion expressed in our report of the race that the speeds were not strikingly high is borne out by the published figures. The fastest speed attained was 61.79 m.p.h. by A. R. Abbott (Rudge), but the most regular speed was maintained by E. W. Cheshire (Triumph). The winning Morgan was only five or six miles per hour slower than the motor cycles.

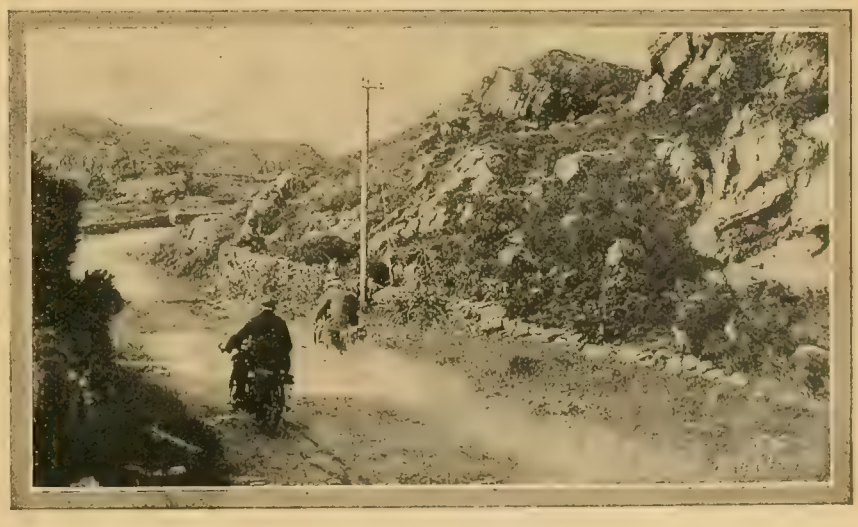
IRISH END-TO-END TRIAL.

THE annual reliability trial from End-to-end of Ireland, under the auspices of the Ulster Centre of the Motor Cycle Union of Ireland, took place on Monday, the event as usual being run from south to north. The start was an hour earlier than a year ago; this gave more night driving, and, despite the better roads, the first section of the course was the severest of the 390 miles. Added to this was the fact that at one part of the road between Goleen and Schull, fifteen miles from the start, obstructions appear to have been deliberately placed on the road, and several riders came to grief. Gibson (Bradbury) had a narrow escape, the wheel of his sidecar striking a log of wood, and another Bradbury rider, Wilhelmj, broke his fork. Wasley (Douglas) was in trouble early. The key of his sprocket became loose in the first hundred yards; he spent a lot of time repairing in the dark, and was over an hour late at Cork (81 miles), but continued. Another Douglas rider who met with early trouble was Towell, who broke the spindle of his back wheel in the first ten miles and had to retire. Shaw (5 Rudge) went astray by following Roche (Rover), the pair not discovering their mistake till near Glengariff, and consequently retired. Knox (Forward) had a lot of tyre troubles before reaching Cork, but went on an hour to the bad, as also did Walsh (Bradbury and Dudley (2½ Hobart). Sweeney (P. and M.) gave up at Cork with tyre and plug troubles, and Healy (6 Enfield) broke a control wire, and was out in the first fifty miles. Murphy (Douglas) had trouble with his pump, but made up time before Cork, and Mooney (P. and M.), after having tyre troubles, ran short of petrol just as he arrived in sight of the control on time. Doleman (5 Rudge) was among those who fell over the obstructions near Schull, but he did no damage beyond breaking off a footrest. Atkinson (3½ Rudge) and Rickerby (5 Rudge) were troubled with tyres on the first section, and did not go beyond Cork.

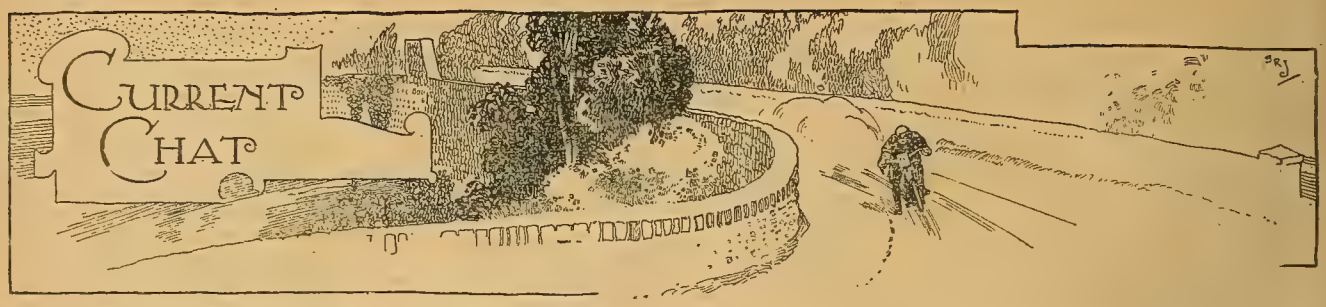
Many riders dropped out between Cork and Dublin, and of the forty riders who left Cork only twenty-nine reached Dublin in time to give them hope of awards. Amongst these O'Sullivan (3½ Humber) had lost eight marks at Mitchelstown control through losing his way. Mooney (P. and M.) was on time, despite fourteen punctures; Panner (6 A.J.S.), Dooley (3½ Ariel), and Martin (Triumph) suffered in the same way. Walsh (Bradbury) retired near Goleen, and Farrell (Triumph) had a fall near Urlingford, which resulted in a broken finger, but he continued.

After Dublin was passed the weather broke up, and a thunder shower was encountered. From Dublin to Antrim Panner had an avalanche of punctures, and retired at Banbridge. Gibson repaired nine, the last being dealt with just before Cushendall, but he still managed to keep to schedule, and made a perfect ascent of both observed hills; his was the only sidecar to finish.

The following were officially observed on the two hills: Stewart (Douglas), Delahay (Sunbeam), Murphy (Douglas), Wasley (Douglas), Russell (Douglas), M'Cann (Triumph), Thompson (B.S.A.), Sullivan (3½ Humber), Chambers (B.S.A.), Fenn (Triumph), Mooney (P. and M.), Porritt (Douglas), Brown (3½ Rudge), Lavery (Ariel), Newey (Ariel), Lucy (Triumph), Farrell (Triumph), Martin (Triumph), Gibson (Bradbury), O'Callaghan (Bradbury), Mallon (Sunbeam), Noble (Rover), McManus (Sunbeam), Woods (P. and M.), and Dooley (Ariel). The winner will probably be found among the following: Thompson (B.S.A.), Delahay (Sunbeam), Newey (Ariel), Gibson (Bradbury), O'Sullivan (3½ Humber), and Farrell (Triumph).



Two competitors on the road between Rock Island coastguard station and Goleen.



TIME TO LIGHT LAMPS.

July	17th	... ...	9.7 p.m.
,,	19th	... ...	9.5 ,,
,,	21st	... ...	9.3 ,,
,,	23rd	... ...	9.0 ,,

The Unlucky (?) Number 13.

Here is a poser for the superstitious! The Motor Cycle Grand Prix Races were run on July 13th, 1913. Fenton, who won the 350 c.c. class, was allotted No. 13, and singularly enough Bourbeau also carried that number to victory on his Bedelia in the cycle car class.

Unsportsmanlike Behaviour.

F. W. Barnes's retirement in the second lap of the Grand Prix was due to the fact that some evilly-disposed person had wilfully wrecked his engine. Such is the verdict of Zenith Motors, Ltd., who have since carefully examined the engine. On being dismantled the crank case was found to contain a quantity of clear sand, which had worked up and scored the cylinders very seriously. This kind of practice is, fortunately, practically extinct in these days, and it is regrettable to have to record such an instance at so important an event as the Grand Prix.

Spanish Road Race.

A number of Grand Prix competitors are making a move to Bilboa this week for a road race on Sunday to San Sebastian and back. The Douglas, Triumph, Rudge, and Humber teams, are among the entries.

Six Days' Trials in Lakeland.

Among the earliest entries for the A.C.U. Six Days' Trials next month are:

F. Dover (3½ Premier).
T. J. Ross (Triumph).
G. D. Hardee (Triumph).
W. J. Spoule (P. and M.).
J. D. Morrison (Bat).
J. Pippins (6 Rudge)

Motor Cyclists and the Navy.

Although we do not suppose motor cycles will actually form part of the equipment of future Dreadnoughts, it is interesting to notice that the Admiralty are availing themselves of the use of motor cycles in connection with the naval manœuvres in August in the North Sea. The Yorkshire coast will be watched during the "battles" by small parties of motor cyclists, who will keep in rapid communication with infantry units stationed in the neighbourhood.

THE GRAND PRIX. De Peyrecave (Duo) negotiating the S bend under a railway bridge outside Boves. This section was included in the car course. De Peyrecave ran very regularly throughout and finished fifth

SPECIAL FEATURES:

THE GRAND PRIX RACES.
IRISH END-TO-END TRIAL.
HINTS TO AMATEURS.

Anglo-Dutch Trial.

The Dutch motor cyclists will be met at Harwich by members of the A.C.U. and also members of the Ipswich and District M.C.C., who have offered to pilot them out of the district.

At a committee meeting in London last week, the price of tickets at the official dinner at the R.A.C. was fixed at 12s. 6d. Evening dress will be worn.

Latest Scottish Trials Entries.

We are informed by Mr. Campbell McGregor, the hon. secretary of the Edinburgh and District Motor Club, under whose auspices the Scottish trials are promoted, that H. F. S. Morgan (Morgan runabout), Lovegrove (3½ Raglan), and L. Martin (Singer cc.) have sent in their entries for the trials. This brings the total number of competitors to 105.

The Grand Prix Races.

From a spectacular point of view, the car race last Saturday was by far the most interesting of the three races, the tremendously high speeds, both on the level and in cornering, which usually resulted in huge skids, rendering the race really exciting. It is interesting to note that the winning car, which averaged 72½ m.p.h., attained a speed of 97 m.p.h. over a measured kilometre, according to *The Autocar* time-keepers.

Singles v. Twins at Brooklands.

The B.M.C.R.C. meeting yesterday, when the six hours' race was run off, was one of the most important racing events of the year on the track. A study of the entries revealed some rather interesting details as to the type of speed machine now in vogue. Among the "junior" machines of the 350 c.c. was an enormous preponderance of twin over single cylinders, no fewer than ten out of fifteen entries being fitted with two-cylinder motors. But when the entry list of the "seniors," or 500 c.c. class, was studied, the exact reverse was found to be the case, only four machines out of eighteen entries being so equipped. The Scotts were entered for the first time in a long distance track event. The Colliers pinned their faith in a 494 c.c. twin, but the 499 c.c. singles were in an overwhelming majority. When we get to the big class, twins again reigned supreme, therefore it appears that at the present time twins hold the field as far as the very small and very large classes are concerned.

Sanction Withdrawn.

The Bradford Motor Cycle Club had arranged to hold an open hill-climb on July 19th, but we are now advised that the police permission, after being granted has been withdrawn, and the climb has therefore had to be abandoned.

English-Dutch Trial.

With reference to the forthcoming English-Dutch motor cycle trial, we are informed that the new president of the Dutch Association, the Nederlandsche Motorwielrijders Vereeniging, Mr. Nico Jannink, will be unable to come over to England with his compatriots. Mr. R. R. toe Laer, the late president of the Association, will, however, come over as first reserve rider.

A.C.U. News.

Permits have been granted to the Hertfordshire M.C.C. to hold a half-day reliability trial on July 19th, to the Mersey M.C.C. to hold a hill climb on Pen-y-ball Hill on Aug. 2nd, and to the Liverpool A.C. to hold a reliability trial (date not settled).

AN UNOFFICIAL TRIAL.—As he was driving a vehicle not under the jurisdiction of the A.C.U. owing to its being overweight, the case of Mr. I. B. Hart-Davies, who recently took part in an unofficial trial, has been handed over to the Royal Automobile Club to be considered.

Bad Road Avoided.

A correspondent writes us to say he has discovered an alternative route from Corwen to Cerrig-y-Druidion avoiding the bad surfaced road between these two places. He went from Corwen to Bala *viâ* Llandrillo, which he considers the better of the two routes, and thence on to Cerrig-y-Druidion. There are no severe hills on this run.

Anglo-Dutch Trial Fund.

We have pleasure in recording the following additions to the fund towards the expenses of this trial:

	£	s.	d.
Mr. J. R. Nisbet ...	1	1	0
Bowden Wire Ltd. ...	1	1	0
Mr. W. B. Gibb ...		10	6
Mr C. R. Charlesworth		10	6

The Portmarnock Fatality.

We regret to announce that W. F. Parker, who was so seriously injured in the collision in which M. J. Barrett was killed at Portmarnock recently, has died after lingering on for a few days. Parker was an Englishman who was engaged in the motor cycle trade in Dublin, and was only nineteen years of age.

Well! Well!!

Quite evidently Skegness does not want motor cyclists, and it would appear that a set of laws, different from our usual code, prevails in that part of England; for if the chairman of the local magistrates is correctly reported, he recently said, in fining two motor cyclists for dangerous driving, that "there was no denying the fact that, even when they kept to the letter of the law, motor cyclists were a public nuisance. They frighten horses and created a stink, and really they had no right to use the public highway at all." Well, we must be thankful to breathe at all after this!

Illuminating Front Numbers.

Last week a motor cyclist was summoned at the Guildhall, London, for alleged negligence in lighting the front number plate. The machine was examined in a darkened room. The numbers appeared to be perfectly lighted, and it is reported that the police said the number plate had been moved since the summons had been issued. This was proved to be absurd, as the lamp bracket was rigid with the forks, and the plates permanently fixed to the mudguard. In the end the case was dismissed on payment of costs, but this case shows that motor cyclists should take pains to satisfy themselves that they go out at night so equipped that the law can take no exception.

FUTURE EVENTS.

July 19.—Herts M.C.C. Open Half Day Trial.
„ 21-26.—SCOTTISH SIX DAYS' TRIALS. Starting Point Perth
Aug 2-3.—International Cup Race in France.
„ 2-3.—Hertfordshire M.C.C. Open Half-Day Trial.
„ 2-4.—M.C.C. Devon Trial.
„ 4.—ENGLISH-DUTCH INTERNATIONAL TRIAL. Starting Point Oxford.
„ 4.—B.A.R.C. Meeting at Brooklands
„ 9.—B.M.C.R.C. Race Meeting.
„ 18-23.—A.C.U. SIX DAYS' TRIALS. Carlisle as Centre.
„ 30.—Herts M.C.C. Open Half-Day Trial.
Sept. 6.—Cov. and Warwickshire M.C. Annual Open Hill Climb.
„ 13.—B.M.C.R.C. Race Meeting.

England's Lead.

The results of the Grand Prix have set the seal on the superiority of English machines. The T.T. Races indicated this happy state of affairs previously, but although they were international in character, the British riders greatly preponderated over the foreigners, and thus one might reasonably look for success. In France, however, the reverse was the case. The French were on their native heath, and had had the advantage of practising on the course, but all the same they were outclassed when it came to racing, and, despite their lack of practice, the British riders were too good for our neighbours. It is said that a boom in motor cycling is pending in France, but with all due respect to their mechanical knowledge, the French designers will have to learn that such things as automatic inlet valves, for instance, are now out of date.

Next Week in Scotland.

On Monday next 103 competitors will be sent off from Perth on the Scottish Trials. These, as regards the route, are by far the most severe test to which any motor cycle is subjected; for, although the regulations in the English Six Days' Trials are stricter, the total distance is less, and bad as the hills in the Lake District, where the trials are being held next month, will be found to be, there is nothing to compare with the Spital of Glenshee or the frightful ascent and descent from Applecross to Tornapress and back. We shall give fully illustrated reports of these trials in our next two issues.

Inexpert Speed Judging.

The Sheffield and Hallamshire M.C.C. are to be congratulated on the non-success of the judges' efforts in their recent speed-judging competition. We say "non-success" advisedly, because the result shows the extraordinary difficulty of estimating speed. Members of the general public were asked to judge the pace of competing motor cycles, and only two out of a large number of guesses were near being correct. It was a curious fact that the noisier the machine the faster the speed was adjudged to be—a matter that has probably misled many a member of the force in the past. Perhaps now the silencer regulations are in full swing and being rigidly applied we shall be judged by the powers in blue to be going slower than we really are. The interesting question arises how many noisy exhausts in the past have been responsible for fines?

Winners of the team prize in the Nottingham and District M.C.C. Reliability Trial for the Campion Cup. From left to right they are G. Brough, W. A. McKeggie, and T. Rigley, all of whom rode 6 h.p. Brough machines.

NEXT WEEK'S SCOTTISH TRIALS.

A Strenuous Course involving Precipitous Hills.

ON Saturday next motor cyclists will be pouring into Perth, the starting place of this year's Scottish Trials, and on July 20th all competitors are obliged to present themselves and their machines at the garage of Messrs. Fergusson and Batchelor at 11 a.m. in order that their machines may be examined and sealed. After the seals have been affixed, no competitor may make any further adjustments.

The total distance of the trials is approximately 980 miles, the longest day's run being the fifth, when about 200 miles will have to be covered.

Two nights will be spent at Strathpeffer, but a different stopping place will be utilised all other nights. For the benefit of our northern readers we repeat the various halts during the week, which are—first day, Inverness, second, Thurso, third and fourth, Strathpeffer, fifth, Grantown, and sixth, Edinburgh. A full list of entrants, with the machines they will ride, has already appeared in our columns.

While the route is, generally speaking, of far greater severity than that of, say, last year's English Six Days' Trials, there is a certain freedom allowed to the competitors that makes the run rather easier from a mental point of view than its English prototype, although harder physically. We allude to the total absence of secret checks. Unless the committee considers that undue scorching takes place, it is quite sufficient for a rider to get to his evening's destination up to time, but if it be considered that reckless riding takes place, the committee reserves the power to enforce secret checks upon due notice being given to the riders.

But those who know the routes will readily agree that it is not very likely that any undue speed work will be indulged in, for even the hardiest scorcher soon tires of thinking he is riding a T.T. when every hour's run is replete with ups and downs and lurid hairpins that put Porlock and Craig-na-baa completely in the shade.

Ups and Downs.

The riders will not have any time to acclimatise themselves to the mountaineering game, for in the first twenty-five miles comes Amulree, followed later in the day by the notorious Spital of Glenshee, which includes the wicked Devil's Elbow. There is practically a fifteen miles climb all the way up to the summit, the road rising from about 800ft. to 2,200ft. above the sea, in that distance. The worst part of this ascent is that the stiffest part of the climb comes at the end, and has to be faced with overheated and tired engines, while the surface is as a rule exceptionally rough.

This mountain has to be traversed from the reverse direction on the last day, but, although a bad climb, it is by no means such a terrifying experience as from the Kirkmichael side. While the whole route abounds with sheer precipice-like rises and falls, the Spital is the severest difficulty in the first half of the trials, but the fourth day provides a perfect nightmare of hills, the climax being the ascent, from both sides in succession, of Applecross. From

Starting the first competitor—W. Bruce Hodgson (3½ h.p. Torpedo)—in the Hull and East Riding A.C.C. Reliability Trial for the Rudge Cup.

Tornapress the road rises sheer for six miles from practically sea-level to 2,100ft., and drops equally abruptly to Applecross. Those competitors who get over this mountain have to return immediately over their tracks to Tornapress, the climb from the Applecross side being slightly the steeper of the two. The road is cut zigzag up the hill, but the surface is reported to be atrociously stony and rough. It can safely be said that any motor cycle which can be coaxed over this mountain road under its own power is capable of going anywhere. Apart from the satisfaction of a successful climb, the competitors will enjoy the finest and wildest scenery of the Western Highlands on this day's run. It must not be forgotten that power of the brakes is quite as important as brake-horse-power in this part of the world, and both will have to be equally vigorously applied to their respective tasks.

After negotiating these obstacles such trifles as the Shiel Inn Hill, about five miles of from 1 in 8 to 1 in 10 on the fifth day, and Kenmore on the last day, do not present much difficulty, severe though they be.

Several machines are making their *début* in long distance trial work, the most notable newcomers being, perhaps, the 3¼ Lea-Francis, 8 Williamson, and the 3½ Edmund. Quite a number of lightweight machines are entered, among them 2¾ Douglas, 2¾ Sun-Villiers, and 3 Enfield, while George Brough is again attempting to emulate his last year's success by riding a single-gear 6 h.p. Brough through the trial. If he succeeds we shall not know which to admire most, the flexibility of the motor or the pluck and skill of the driver.

Scene in the Sheffield and Hallamshire M.C.C. speed-judging contest, in which the spectators and not the motor cyclists had to judge the speeds.

B.M.C.R.C. Six Hours' Race.

AN OPEN EVENT FOR MOTOR BICYCLES, SIDECARS, AND CYCLE CARS.

The following is the complete list of entries for the Brooklands meeting, which took place yesterday. Considerable interest centred in this meeting, and some competitors had been preparing their machines for a long time past.

DIVISION I.

CLASS A. (Cylinder capacity not exceeding 275 c.c.)

Rider, Machine, and Cubical Capacity.	Rider, Machine, and Cubical Capacity.
H. Martin (1-cyl. Martin, 268 c.c.)	

CLASS B. (Cylinder capacity not exceeding 350 c.c.)

Hugh Mason (2-cyl. N.U.T., 350 c.c.)	J. T. Bushall (2-cyl. Douglas, 349 c.c.)
P. Newbold (1-cyl. Zenith, 345 c.c.)	M. Heinzel (2-cyl. N.S.U.)
S. Wright (2-cyl. Humber, 350 c.c.)	R. J. Bell (2-cyl. N.S.U.)
F. G. Edmond (2-cyl. Humber, 350 c.c.)	E. E. Elwell (2-cyl. Douglas, 350 c.c.)
S. H. Dawson (1-cyl. Humber, 348 c.c.)	E. Milner (2-cyl. Douglas, 350 c.c.)
W. R. Steel (1-cyl. Sunbeam, 350 c.c.)	G. E. Stanley (1-cyl. Singer, 349 c.c.)
A. Bushall (2-cyl. Douglas, 349 c.c.)	T. Thompson (2-cyl. Douglas, 350 c.c.)
	H. H. Clark (1-cyl. Corah, 350 c.c.)

CLASS C. (Cylinder capacity not exceeding 500 c.c.)

G. Baker (1-cyl. Peerless, 499 c.c.)	J. Cocker (1-cyl. Singer, 499 c.c.)
L. Cushman (1-cyl. N.L.G.)	F. A. Applebee (2-cyl. Scott, 486 c.c.)
C. G. Pullen (Rudge, 499 c.c.)	A. J. Dixon (1-cyl. Singer, 499 c.c.)
C. R. Collier (2-cyl. Matchless, 494 c.c.)	H. O. Wood (2-cyl. Scott, 486 c.c.)
D. R. O'Donovan (1-cyl. Norton, 490 c.c.)	P. Brewster (1-cyl. Norton, 490 c.c.)
W. G. Howard (2-cyl. Matchless, 496 c.c.)	J. L. E. Emerson (1-cyl. Norton, 490 c.c.)
H. Reed (1-cyl. Dot, 499 c.c.)	S. A. Rowlandson (1-cyl. Rudge, 499 c.c.)
E. H. Victor (1-cyl. Singer, 499 c.c.)	R. Bownass (1-cyl. Matchless 499 c.c.)
O. C. Godfrey (1-cyl. Indian, 497 c.c.)	R. B. Ewens (1-cyl. Rudge, 499 c.c.)

CLASS D. (Cylinder capacity not exceeding 750 c.c.)

S. R. Axford (2-cyl. Martin, 738 c.c.)	F. A. McNab (2-cyl. Triumph, 745 c.c.)

CLASS E. (Cylinder capacity not exceeding 1,000 c.c.)

H. Reed (2-cyl. Dot, 986 c.c.)	A. A. Knight (2-cyl. Zenith)
E. Gwynne (2-cyl. Indian, 998 c.c.)	J. Hellaby (2-cyl. Indian, 994 c.c.)

DIVISION II.

CLASS G. (Cylinder capacity not exceeding 500 c.c.)

H. Le Vack (2-cyl. Motosacoche, 496 c.c.)	H. C. Wells (1-cyl. Zenith-Green, 499 c.c.)
J. S. Holroyd (2-cyl. Motosacoche, 496 c.c.)	Howard Riddell (Zenith-Precision, 499 c.c.)

CLASS H. (Cylinder capacity not exceeding 750 c.c.)

R. E. Guest (2-cyl. Matchless, 742 c.c.)	E. B. Ware (2-cyl. Zenith, 750 c.c.)
H. Gibson (1-cyl. Bradbury, 554 c.c.)	

CLASS I. (Cylinder capacity not exceeding 1,000 c.c.)

S. T. Tessier (2-cyl. Bat)	N. F. Holder (2-cyl. Morgan, 986 c.c.)
F. W. Barnes (2-cyl. Zenith)	

DIVISION III.

CLASS J. (Cylinder capacity not exceeding 750 c.c.)

J. F. Buckingham (1-cyl. Chota, 746 c.c.)

CLASS K. (Cylinder capacity not exceeding 1,000 c.c.)

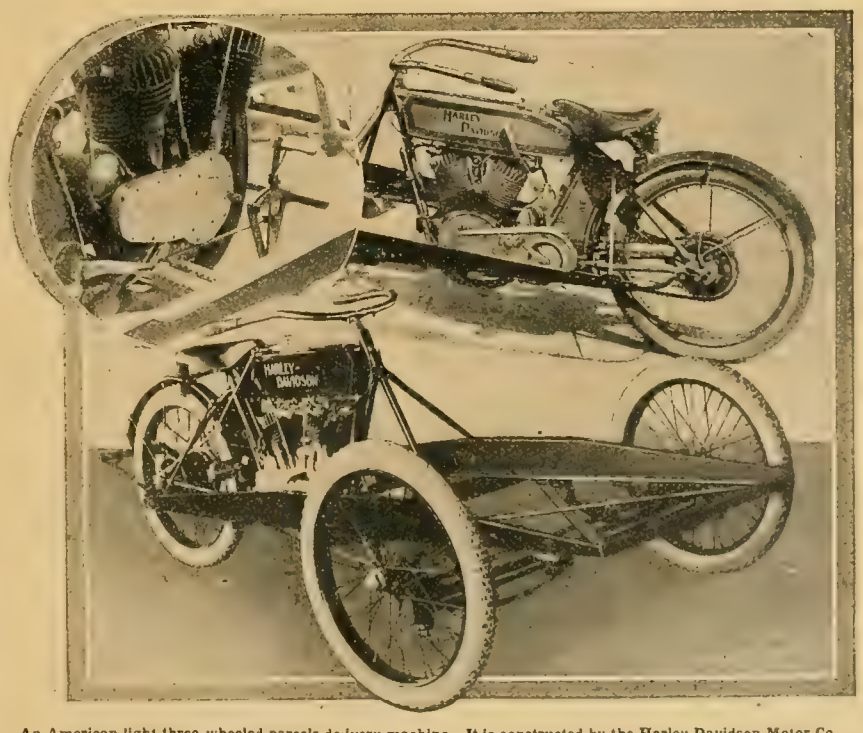
L. Martin (4-cyl. Singer, 1,096 c.c.)	A. Francis (2-cyl. Duo, 1,075 c.c.)
L. F. de Peyrecave (2-cyl. Duo, 985 c.c.)	C. F. Halsall (4-cyl. Wilton,

As will be seen from the above, sidecars and three-wheeled cycle cars were run in the same class.

A Sturdy American Three-wheeler.

THE Harley Davidson Motor Co., a firm of high repute in America, have recognised that there is a big future for the light three-wheeled parcels delivery machine, and have evolved a most satisfactory looking design for the work. The chassis is designed to carry 600 lbs., and is constructed of pressed steel, very stoutly fixed to a special motor cycle frame. The big twin engine drives through a two speed and free engine to the rear wheel, the transmission being by chain. A spring saddle-pillar is fitted, and an automatic carburetter. The engine and gears are practically fool-proof, and are very soundly constructed. The petrol consumption with load works out at about 32 m.p.g.

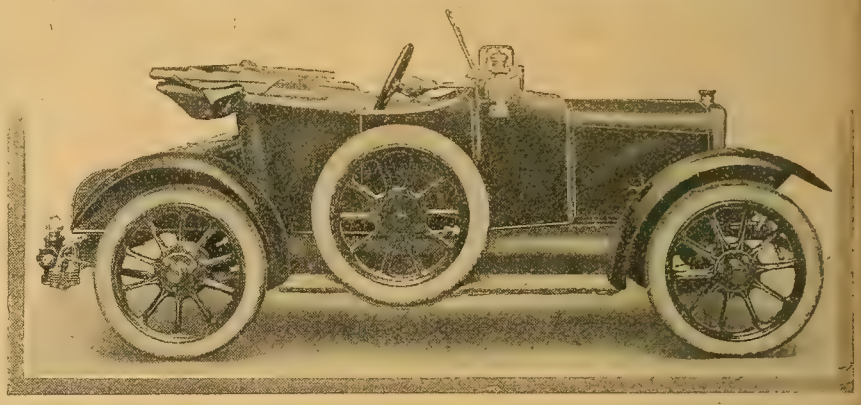
The gear is of the counter-shaft type, and although wheels are always in mesh the shafts do not revolve except when the low gear is in operation. The engine may be started with the wheel on the ground, and the pedals used for this purpose also apply a powerful hub brake if their motion be reversed. An additional brake pedal is convenient to the driver's right foot, and is held by a ratchet, thus allowing the machine to be left standing on a slope. 28in. × 3in. tyres are used throughout, and the front of the vehicle is suspended on quarter elliptic springs, which are fixed below the axle tubes. Gear ratios of 5 to 1 and 10 to 1 are employed, whilst the vehicle has a track of 56in. and a wheelbase of 76in. We hear that many of these machines are already in use and giving satisfaction in all weathers and under all conditions.



An American light three-wheeled parcels delivery machine. It is constructed by the Harley Davidson Motor Co., and has a twin-cylinder engine and two speed gear. The carrier frame is of pressed steel.

LATEST PERRY DETAILS.

WE recently had an opportunity of seeing one of the latest Perry cycle cars, which is sold in London by Cars and Motor Sundries, Ltd., 175, Shaftesbury Avenue, W.C. Since the chassis was first exhibited at the Show and described in these pages, the Perry has undergone some slight alterations, though the main features are kept the same. The engine is now fitted with a Zenith carburetter, which gives plenty of power and yet permits of slow running. The final drive is by bevel instead of by worm as originally fitted. The body is of pleasing appearance, and is most comfortable, while the sloping dashboard, under which the petrol and oil tanks are carried, is quite graceful. The car is supplied complete for 130 guineas, with five detachable wheels and shock absorbers to the back springs. These springs are carried underneath the axle. The five wheels are provided with brake drums which are detachable with the wheels, and in the case of the front wheels these drums act as an adequate protection for the steering joints. The steering on this little vehicle is direct. The whole design shows careful forethought, and such refinements as sheet steel valances between the steps and the body, and inner shields to the handsome dome mudguards are provided. Messrs. Cars and Motor Sundries, Ltd., are now able to deliver a limited number of these attractive little vehicles, which should find a ready market.



Side view of the 10 h.p. twin-cylinder Perry light car.

CYCLE CAR TIPS.

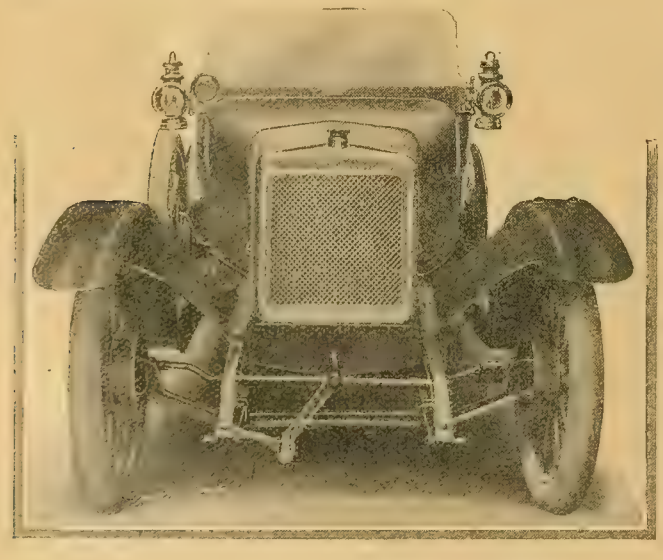
DON'T fold up your hood till it is dry.

Don't leave a machine standing on an incline with only a brake to hold it.

Don't forget to engage a low gear and close the throttle before descending dangerous hills.

Don't forget to oil and grease your machine regularly. The leaves of the springs should receive occasional attention in this respect.

To make the best use of your head lamps, fix them fairly low down; see that both lamps and brackets are securely fastened.



Front view of the Perry showing neat appearance and general lines.

Tar stains are best removed with benzine though petrol is a fair substitute. The tar should be softened first by applying a greasy substance, such as butter, to the stains.

Springs after hard use are apt to lose their temper, or "to take a set," another leaf will often put things right. If not, they should be returned to the makers.

A few spare minutes may be well spent filling cuts in tyres; this will often prevent long stoppages on the road, besides increasing the life of the tyres.

Keep your engine clean and use good lubricating oil. Good lubrication means long life and economy.

If a rattle develops, see to it at once or it may result in a broken mudguard stay or some other part.

Keep your brakes well adjusted; your life and that of your passenger often depend on them.

Don't overload your cycle car. It is all very well to take four up certain hills, but the machine was not built for it, and you are doing it no good.

Keep your magneto points clean and well adjusted; this and absence of air leaks in the intake system will ensure easy starting.

Whether you have a differential or not, drive reasonably round corners. Fast cornering, besides being dangerous to yourself and others, is bad for tyres, wheels, axles, and transmission.

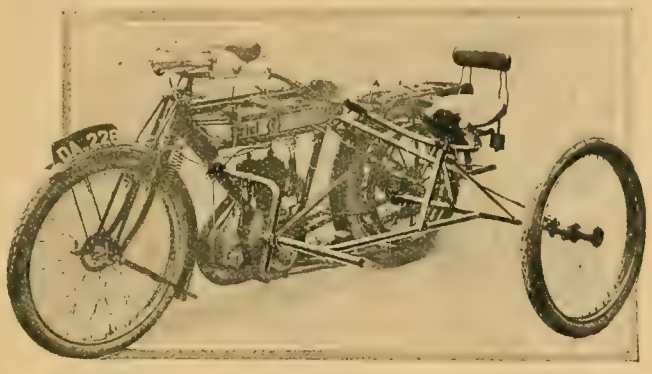
If rain spots get on to freshly painted coachwork these should be removed by copious washing with plenty of water at the earliest moment. A few spots of rain will make more marks on new paint than a deluge. This is particularly the case with the bonnet, the heat of the engine drying up spots from a light shower very quickly.

A Featherweight Attachment.

THERE are many riders at the present time who possess machines of 3½ h.p., or less, who would often be glad to take an occasional passenger, and who, wisely, do not care to use their carriers for the purpose or to attach a heavy sidecar to a lightweight or single-geared 3½. To such as these the attachment manufactured by the Tennant Engineering Company will come as a solution to the puzzle. It consists of a strongly built sidecar chassis of somewhat special construction, on which is mounted, in lieu of the usual body, a large Brooks saddle with back rest; a pair of handle-bars are clipped to the seat post and project in an inverted position on each side of the passenger. A 26×2¼ Continental tyre is fitted, and a stout domed mudguard covers the wheel. At first sight the outfit looks bare and uncomfortable, but a trial run showed that this was not by any means the case, and though, of course, the luxury of the modern sidecar chair is absent, the machine was really wonderfully comfortable.

Decreased Windage.

The strains on the motor cycle frame are considerably decreased as the complete sidecar, with quick detachable fittings, weighs less than 40 lbs., and there is no heavy body to sway outwards and cause side pull; added to this the windage is slightly decreased. In the case of bad weather a waterproof sheet can be supplied at a small extra cost, which passes from the axle round the outside of the footboards and upwards over the passenger's legs to the handlebars. The footboards are not shown in our photograph, but lie directly behind the front cross stay. Without saddle and handle-bars the machine weighs only 30 lbs., and in this state can be used as an outrigger to prevent skidding on greasy roads. Deliveries can be made in seven days, and the price is £5 10s. There should be quite a future for the device, especially among the sporting brigade. The Tennant Engineering Company, whose address is Pershore Street, Birmingham, have also recently taken over the manufacture and sale of the Glad Eye electric motor cycle lamp, which they will shortly be able to deliver in quantities. This lamp was described and illustrated in *The Motor Cycle* of February 13th last. It has a swivelling bracket which enables the light to be thrown on the machine for repairs.



A lightweight passenger attachment made by the Tennant Engineering Co.

Bonuses in Competitions.

AT a meeting of the Manufacturers' Union, held last week, the question of the payment of competition riders for using various accessories, such as carburetters, tyres, belts, etc., in races and hill-climbs, was fully discussed. Readers will remember that we published an article on the same subject in the issue of March 6th last.

Two Important Resolutions.

The outcome of the discussion at the meeting was that a committee was appointed, consisting of four members from each section, "to consider the advisability of taking steps to regulate, or to put an end to the existing practice of offering bonuses, retainers, and the like, to trade and private motor cycle competition riders." Another resolution that was passed at the same meeting was, "That in the opinion of the meeting, the time is now opportune for the whole question of competitions to be considered in all its aspects, and that four members of each manufacturers' section be invited to form a sub-committee for that purpose." Both the above resolutions were unanimously carried.

The payment of competition riders for the use of various accessories has become such an abuse that, instead of a manufacturer fixing the specification of his machine, the competition riders do it for him. This is brought about as follows. Presuming that a manufacturer decides on a certain specification, and delivers a machine to a competition rider, who is financially interested in two or three different makes of accessories, if he does not find the standard specification includes these items, he removes the standard equipment, and substitutes for it articles for which he receives a bonus from the manufacturers in the event of a win. Many makers claim that this prevents their finding out what is the best equipment for any particular machine, and their conclusions become involved, owing to the fact that the articles used by many competition riders are not employed because of their merit, but on account of the bonuses paid for successes. Manufacturers of complete machines are of the opinion that if the accessory makers wish to contribute towards the expenses of racing, it would be far better for them to do so openly, instead of offering retainers to the riders. One suggestion made was that any bonuses offered by accessory firms should be offered to the maker of the machine, as by so doing the accessory maker would contribute towards the cost of racing.

Heavy Cost of Racing.

The Union contends that it is uncommercial for bonuses and retainers to be offered to the rider of the machine, but that if they were offered to the maker, the particular article in question would only be used provided it was of real merit, and the bonuses so provided would help towards the heavy cost of supporting race meetings and competitions.

Whether the Union will be able to put an end to the practice of presenting bonuses is very much open to question, but the fact that they have considered it advisable to attempt to regulate the matter is one which will be welcomed by the majority of our readers.

IMPORTS AND EXPORTS.

The following figures show the imports of motor cycles and parts have increased steadily, the chief increase in parts being accounted for by tyres:

	Month ended June 30th.			
	1912.		1913.	
	Number.	Value.	Number.	Value.
Motor cycles ...	124	£3,803	243	£8,323
Parts		£14,886		£19,362
	Six months ending June 30th.			
Motor cycles ...	793	£24,828	1,161	£39,484
Parts		£57,292		£107,318

The export of motor cycles has increased in roughly the same proportions as the imports, but the numbers and values are much greater.

	Month ended June 30th.			
	1912.		1913.	
	Number.	Value.	Number.	Value.
Motor cycles ...	559	£23,115	1,419	£62,416
Parts		£9,878		£21,437
	Six months ended June 30th.			
Motor cycles ...	4,931	£195,311	8,677	£369,655
Parts		£74,137		£119,031

CLUB NEWS.

Showing the two lines of spectators in the Sheffield and Hallamshire M.C.C. competition judging the speed of a passing motor cyclist.

Sheffield and Hallamshire M.C.C.

A novel competition was held on the 12th inst., which consisted of speed-judging by the general public. The speeds varied from 7 to 45 m.p.h., and, as might have been expected, the estimates were, in many cases, very wide of the mark, especially so in the case of the higher speeds, which were much over-estimated when the machine was noisy or geared low. The winner gave only two correct results.

Bishop Auckland, Darlington, and District M.C.C.

A hill-climb took place at Legs Cross, near Piercebridge, on the 9th inst. Results: W. Swan (5-6 Zenith), 10s. start; J. P. Foster (5-6 Bat-Jap), scratch.

Middlesbrough and District M.C.C.

There was a sidecar trial on the 9th inst. over a forty-five mile course *via* Marton Bungalow, Stokesley, Easby, Ayton, Guisborough, Ormesby. Result: 1, R. Sorrell, lost 4m. 5s.; 2, H. B. Beckwith, lost 4m. 10s.; 3, G. W. Liddle, lost 4m. 25s.

Scottish Border M.C.C.

The club held an open hill-climb at Lanton Hill on the 12th inst. Results: Class V. Generals. Lightweights up to 350 c.c.—1, J. Balfour-Robertson (2¾ Douglas), 64.3s.; 2, A. N. Toovey (2¾ N.U.T.), 71.2s.; 3, G. L. Carmichael (2½ Singer), 79s. Class VII. Open, any machine.—1, J. R. Alexander (7 Indian), 50s.; 2, D. S. Alexander (7 Indian), 50.3s.; 3, C. Armstrong (7 Indian), 54.3s.; 4, A. J. C. Lindsay (3½ Rover), 55.1s. Class VIII. Generals; any machine.—1, J. B. Innes (5-6 Bat), 52.1s.; 2, J. B. Robertson (7 Indian), 54.1s. Class IX. Generals; machines up to 600 c.c.—1, R. McGibbon (3½ Norton), 54s.; 2, J. B. Laing (3½ Triumph), 57s.

Nottingham and District M.C.C.

The results of the Campion Challenge Cup trial are as follows:

	Rider and machine.	Marks lost.	Total error. m. s.
1.	C. C. Elborne (Triumph) ...	0 ...	3 54
2.	George Brough (Brough) ...	0 ...	4 13
3.	Harold Marshall (Campion) ...	0 ..	5 14
4.	H. S. Dawson (Bradbury) .	0 ..	5 37
5.	Miss Richards (Sun)	0 ...	5 48
6.	J. Richards (Sun)	0 ...	8 0

TEAM PRIZE.

1. Brough team—Geo. Brough, W. A. McKeggie, and T. Rigley.
2. Sun team.—Miss Richards, J. Richards, and J. Fisher.
3. Triumph team.—C. C. Elborne, R. B. Glover, and J. Mitchell.

Bradford M.C.C.

A twenty-four hour reliability trial to London and back took place on the 5th inst. Six clubs sent teams, Crossgates M.C.C. proving to be the winners. T. G. Bulliss (3½ P. and M.) won the trophy.

Cumberland County M.C.C.

Fifteen members took part in the twenty-four hours' reliability trial to Birmingham and back. Results—Solo machines: 1, J. Robinson (2¾ N.U.T.); 2, W. B. Little (3½ Premier); 3, W. B. Jeffreys (8 Zenith). Sidecars: 1, T. B. Westmorland (6 Matchless); 2, T. Wilkinson (5-6 Clyno).

North Birmingham A.C.

A flexibility hill-climb was held on the 12th inst. Result: 1, Howard Newey (2¾ Levis); 2, Harry J. Moseley (3½ Wearings-Jap); 3, Roy Lovegrove (3½ Singer); 4, Gerald Lovegrove (3½ Raglan); 5, E. H. Bayliss (8 Chater-Lea sc.); 6, A. W. Thrush (Triumph).

Hull and East Riding A.C.C.

A reliability trial was run off on the 12th inst. over a course which included the famous hills of Staxon and Garrowby. The following made non-stops: Bruce Hodgson (3½ Torpedo), T. T. Laker (3½ Torpedo T.T.), B. Rhodes (3½ three-speed Rover), H. Taylor (3½ B.S.A.), Hughes (3½ B.S.A.), J. Padgett (3½ Ariel), and J. Harland (5-6 Clyno and sc.)

Lincolnshire M.C.C.

The results of the hill-climb held at Scamblesby on the 5th inst. on the knock-out principle are as follows:

Class I.—1, C. O. Hayward (2¾ Douglas); 2, Ward (2¾ Douglas).

Class II.—J. Drakes (3½ B.S.A.); 2, J. H. Brookes (3½ Rudge).

Class III.—1, B. Rhodes (8 Zenith); 2, S. E. Sanders (7 Indian).

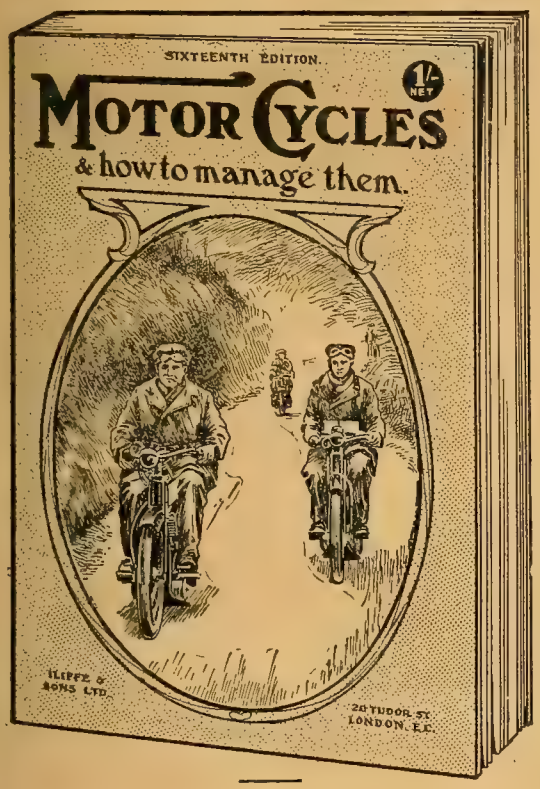
Walthamstow M.C.

The annual Dinner Cup Competition was held from London to Manchester and back as a non-stop and speed-judging competition, watches and speedometers being barred. Results: Silver cup and gold medal, G. Wilson (2½ S.I.A.M.T.), error 1m. 8s. Silver medals—G. West (5 A.C.), error 1m. 31s.; W. S. Low (3¾ Scott), 2m. 26s.; A. T. Peppercorn (3½ Bradbury), error 8m. 3s.; C. Lankshear (3½ James), error 8m. 3s.; H. J. Beal (4 L.M.C.), error 9m. 20s.; A. J. Peppercorn (3½ Bradbury), error 9m. 35s.; F. Cudden (3½ Ariel), error 10m. 57s.; J. Henbrey (8 Chater-Lea sc.), error 13m.; R. J. Holt (15 Darracq), error 13m. 18s.; and —. Price (3½ Humber), error 14m. 3s.

Competitors in the Bradford M.C.C. trial to London and back crossing the bridge over the Trent near Newark.

NOW READY.

A New Edition of this Popular book on Motor Cycles.



Price 1/- net.
By post 1/3.

Carefully revised throughout and brought up to date by the staff of "The Motor Cycle."

* * *

50 extra pages and nearly 100 new illustrations.

* * *

The chapters dealing with the Carburetter, Transmission and Gearing, have been greatly enlarged and are a most important feature of the edition.

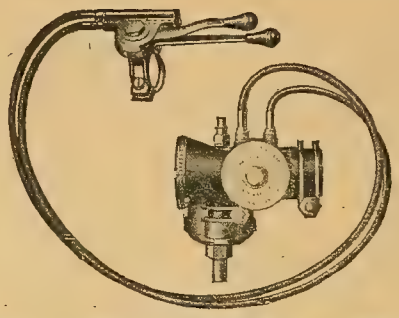
"MOTOR CYCLES AND HOW TO MANAGE THEM" is unquestionably the best and most complete handbook on motor cycles, their care and management. The sixteenth edition (now on sale) is a great improvement on its predecessors, and will be found invaluable to beginners, and both useful and instructive to more experienced riders. It deals with a multitude of subjects relating to all types of motor cycles, and new matter is included dealing with cycle cars.

The buyer of a second-hand machine will find the book equally useful, as it describes old type carburetters, ignition systems, etc., in a special chapter on second-hand motor cycles.

Obtainable from

Iliffe & Sons Ltd., 20, Tudor Street, London, E.C.——And all booksellers.

The only Carburetter which PERFECTLY ATOMIZES the petrol.



Perfect for TOURING or RACING.

SENSPRAY
CARBURETTER.

BRISTOL B. & M.C. OPEN HILL-CLIMB

(Clapton-in-Gordano)

Club News.—

Bristol M.C.C.

A picnic was indulged in on the 5th inst. The next event of importance is a 24-hour run on the 25th and 26th inst. to either Land's End or Llandudno and back.

Herts. M.C.C.

The third half-day open sporting trial will take place on the 19th inst., starting from the George Hotel, Enfield, at 2.30 p.m., and finishing at the Salisbury Hotel, Barnet. The trial will consist of non-stop runs, speed trials, and a hill-climb.

Leeds M.C.C.

An interesting and amusing gymkhana was held on the 2nd inst. in the pretty village of Harewood. The weather was somewhat threatening, although it managed to keep fine. The competitors and spectators, of whom a large number were of the fair sex, entered into the fun with zest.

Merionethshire M.C.C.

A petrol consumption test took place on the 2nd inst. A hilly route of twenty-four miles was selected. Results:

1. O. P. Hughes (Turner light car) ... 36 m.p.g.
2. A. Williams (3½ Triumph) ... ... 147 m.p.g.
3. B. Edwards (3½ B.S.A.) ... ... 122 m.p.g.

Liverpool A.C.C.

The postponed Buxton reliability trial was held last week. E. F. Baxter (6 Rex) was the winner, with L. V. Barton (6 Rex) second.

The open reliability trial has been postponed from July 26th to August 9th. Particulars and entry forms from the hon. sec., Mr. S. W. Phillpott, 1, Oakdale Road, Mossley Hill, Liverpool.

Burton-on-Trent and District M.C.C.

A thirty-five mile reliability trial, under novel conditions, was held on the 9th inst. The route was kept secret, and each competitor was directed to proceed to Lichfield, where "sealed orders" were distributed. From Lichfield the party had to return by a round-about course passing through Handsacre and Abbots Bromley. Results: 1, C. Mansfield (2¾ Douglas), loss of time 4m. 45s.; 2. W. Williams (3½ Williams sc.), loss 7m. 40s.; 3, E. Payne (3½ Rudge), loss 7m. 41s.; 4, R. P. Robinson (3½ Rex), loss 8m. 25s.; 5, W. V. Harrad (5-6 Clyno sc.), loss 11m. 45s.; 6. H. Hardwick (3½ Triumph), loss 16m. 10s.; 7, Jones (3½ Ivy-Precision), loss 18m. 42s.; 8, W. Dunkerley (3½ Triumph sc.), loss 28m. 30s.; 9, Harold Hardwick (3½ Rudge-multi sc.), loss 33m. 10s.; 10, G. A. Bivens (3 Fafnir), loss 99m. 5s.

Cape Peninsula M.C.C.

A hill-climb for sidecars took place recently on the road to the Kloof-nek. There were two hairpin bends with gradients of 1 in 4 and 1 in 3. Winners: Class I. (Under 560 c.c.).—J. Thornton (3½ P. and M.). Class II. (Over 560 c.c.).—D. Garlick (6 Enfield), who also made fastest time of the day.

Birmingham M.C.C.

The annual club reliability trial to Edinburgh and back will take place on August 2nd and 4th. The start will be at 2 a.m. from Messrs. Sarson and Duke's Garage, Birchfield Road, near Perry Barr. Assistance *en route* will lead to disqualification, but small spares may be purchased. Route: Sutton Coldfield, Nottingham, Doncaster, Boroughbridge, Carlisle, Edinburgh; return, Carlisle, Shap, Preston, Warrington, Tarporley, Whitchurch, Newport, Brownhills, and finish at the Parson and Clerk. Application by intending entrants should be made to Mr. S. C. Perryman, 29, Albert Street, Birmingham.

Westmorland M.C.C.

By the kind permission of Lord Lonsdale, the above club held their annual speed trials in Lowther Park on the 5th inst. The event was also open to members of the Cumberland Club. The course was half-a-mile in length and a flying start allowed. Four classes were run, the first three on time and the fourth on formula. Results:

Class I.—Up to 350 c.c.

	Time.
H. Mason (2¾ N.U.T.)	30⅕s.
W. Westwood (2¾ Douglas)	35s.
P. Gilbanks (2¾ Douglas)	39⅘s.

Class II.—Up to 560 c.c.

H. Taylor (3½ Bradbury)	30⅘s.
J. E. Dean (3½ Singer)	31⅗s.
J. Braithwaite (3½ Braithwaite)	32⅖s.

Class III.—Up to 1,000 c.c.

B. Jefferys (8 Zenith)	27s.
A. I. Moffat (6 Zenith)	28⅘s.
H. Taylor (3½ Bradbury)	30⅘s.

Class IV.—Sidecars.

	Fig. of merit.
G. W. Braithwaite (3½ Zenith)	1,577
H. Taylor (3½ Bradbury)	1,668
E. Burras (3½ Zenith)	2,015

BANK HOLIDAY AT BROOKLANDS.

On August Bank Holiday Monday (August 4th), there will be three races for motor cycles and one for cycle cars, together with a "winner's" handicap for winners in the motor cycle, cycle car, and car races. One of the motor cycle events will be for machines fitted with sidecars. Entries close July 21st, and are 10s. 6d. per event, except the winners' handicap, entrance for this being free. Racing commences at 12 noon. The events are as follows:

The Sixteenth Short Motor Cycle Race. (A handicap.) For all classes of motor bicycles. Distance, about 5¾ miles.

The Thirteenth Long Motor Cycle Race. (A handicap.) For all classes of motor bicycles. Distance, about 8½ miles.

The Second Cycle Car Handicap. Distance, about 5¾ miles.

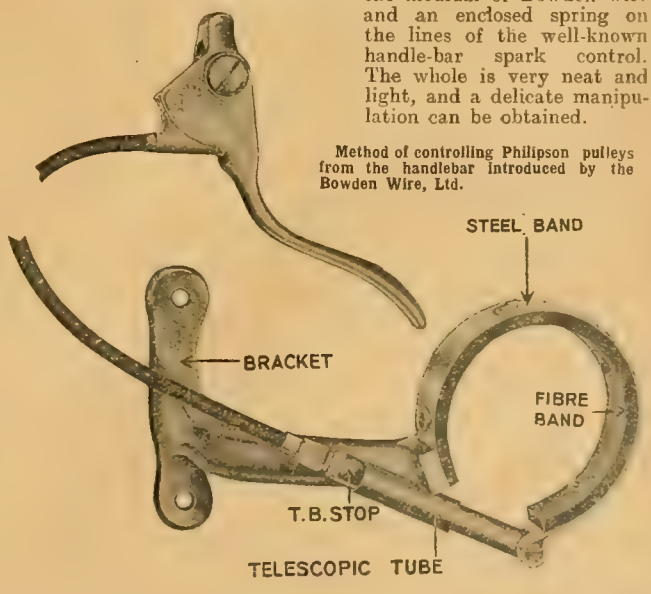
The August Sidecar Handicap. Distance, about 5¾ miles.

A Winners' Handicap. For all winners in above events. Distance, about 5¾ miles.

CONTROL FOR PHILIPSON PULLEY.

Now that the Philipson pulley is becoming so popular and some riders are spending much time in devising controls for the same, a ready-made handle-bar control is being turned out by Bowden Wire, Ltd., Pratt Street, Camden Town. The Philipson pulley, as most of our readers know, will act automatically according to the load on the engine and the gradient of the hill, but some think that it is an advantage to have a separate control. As will be seen from our illustration a fibre faced band brake is mounted on a stout bracket which can be attached to the crank case bolts, and on this bracket is mounted the stop for the wire control.

On the handle-bar is mounted a lever of the usual brake or exhaust lifter type connected to the brake band through the medium of Bowden wire and an enclosed spring on the lines of the well-known handle-bar spark control. The whole is very neat and light, and a delicate manipulation can be obtained.



Method of controlling Philipson pulleys from the handlebar introduced by the Bowden Wire, Ltd.

Records at Brooklands.

Oleo plugs were used in the recent record-breaking ride made by Howard Riddell at Brooklands.

Benzole in Oxford.

We learn that the Midland Motor Company, Oxford, stock benzole, and understand that they are the only people in the University city to do so.

Hints for F.N. Riders.

Messrs. F.N. (England), Ltd., 106, Great Portland Street, W., have brought out a little booklet entitled "Hints and Tips for the 5 h.p. Four-cylinder F.N." This publication should be of inestimable value to users of this machine. It will be sent post free on receipt of a post-card to any F.N. rider.

Palatine Tyres.

Palatine motor cycle tyres, which recently underwent a 3,000 miles test under the observation of the A.C.U., from which they emerged with great success, are proving themselves equally satisfactory in the hands of private users. We learn that J. J. Day, of Blackpool, gained a gold medal on these tyres, which were fitted to his 3½ h.p. Bradbury and sidecar in the recent Liverpool to Edinburgh and back twenty-four hours' run.

"Continental" Insurance Scheme.

The Continental Tyre Co. have a scheme by which all workmen who have served the company for ten years receive a life insurance policy of £75, and similar arrangements are made for certain of the clerical staff. Over 300 workmen and 100 of the office staff have been awarded this benefit. Every year bonuses are distributed, and the amount given to workmen in 1912 totalled £2,500 in addition to a further £1,000 for contributions in aid of the widows and orphans of deceased workmen.

New Edition of "Motor Cycles and How to Manage Them."

A new and enlarged edition of "Motor Cycles and How to Manage Them" is now ready for circulation. This useful and popular work has been brought right up-to-date, and several new features are included among them chapters on cycle cars, decompressors, spring frames, etc. All such important details as carburetters, magnetos, lubricating devices, etc., are dealt with in separate chapters, and the number of illustrations has been greatly increased. The cubical capacity table is not the least instructive feature. It has been compiled by *The Motor Cycle* staff, and may be obtained, price 1s., from our publishing offices at 20, Tudor Street, London, E.C.

Dunlop Successes.

Users of Dunlop tyres and belts have of late been wonderfully successful. W. J. Clarke, who has recently established an unofficial sidecar record week's ride on a 4¼ h.p. Monarch-Precision, fitted with a Roc gear, used Dunlop tyres and belt on his combination with excellent results, covering 1,800 miles in 118½ hours' actual riding time. The recent "Benzole" race at Brooklands was won by G. E. Stanley on a Dunlop-tyred and belted Singer, and other successes on similarly equipped machines have lately been numerous.

Victor Motor Cycle Tyres.

At the recent cycle car hill-climb at South Harting Hill, near Petersfield, Lord Exmouth, driving his G.N. cycle car used Victor motor cycle covers, a make he has favoured for some little time, with, we understand, excellent results.

A Handy Book.

"The Motor Mechanic Handbook:" F. Heron-Rogers and G. W. Watts; Cassell and Company, Limited. A useful book for motor vehicle owners and mechanics, and all those interested in internal combustion engineering.

Notice of Removal.

Owing to the extraordinary increase in their Scottish trade the Avon Indiarubber Co., Ltd., have found it necessary to remove their Glasgow branch from 197, Buchanan Street, to larger and more commodious premises situated at 250, Buchanan Street

Change of Address.

The Dunlop Rubber Co. are now in new premises at 63, Bath Street, Glasgow, where all communications relating to Scottish business should be addressed. The repair works are located at 60, North Wallace Street, Glasgow.

Rom Heavy Tyres.

The Rom Tyre Company are making a special point of catering for sidecar owners and for those who have heavy twin machines. The 650×65 Rom combination cover has a tread of 17 mm. thickness, and is so manufactured that a skid is practically impossible on any kind of surface, wet or dry. The Rom Co. also make a heavy tread cover 26×3 to fit 2½ rims, and 26×2½ to fit a 2¼ rim.

British Successes in Canada.

Represented by the single-cylinder Triumph, England competed against America very successfully at a race meeting at Toronto. In the hill-climb for sidecars, in which machines up to 4 h.p. were eligible, H. Greenwood, on a Triumph, won in 38s., and P. Barnes, on a Triumph, was second in 44⅘s. In the class for 4 h.p. machines, Bastedo, on a Triumph, only failed to win by the fraction of a second, and there were five Triumphs in the first nine. Special prizes for flexibility were awarded Greenwood and H. Burgess both on Triumphs.

"The Motor Cycle" Photographs.

Duplicates of photographs appearing in "THE MOTOR CYCLE" will be supplied at the following rates:—Unmounted prints, half plate 1/6 post free; mounted, 1/9 post free. This refers to photographs taken by "THE MOTOR CYCLE."

Orders, which must be accompanied with remittance, should be addressed to the Photographic Department, Iliffe and Sons Limited, 20, Tudor Street, London, E.C.

"Lyso" Belts Victorious.

We learn that H. Collier, who ran up such a remarkable sequence of five wins at Brooklands on the 5th inst., including the Harry Smith Gold Cup, on his Matchless racer, used Lyso belts in all the events.

"Le Guide Michelin."

"The Michelin Guide to France." This indispensable work to those who tour on the Continent has been still further improved for 1913. Maps on a smaller scale have been added and the book is thinner and a little longer.

Road Maps of Ireland.

Messrs. G. W. Bacon and Co., 127, Strand, W.C., have sent us a case of motor road maps of Ireland. These maps are five miles to the inch and are supplied in a neat case. Each map is particularly clear and is mounted on linen and cut into sections.

A.C. Financial Success.

We understand that the directors of Messrs. Auto-Carriers (1911), Ltd., as a result of the year's trading ending February 28th last, have recommended the payment of a dividend of 6% on the preference shares and a 6% dividend on the deferred shares. We are informed that the amount of profit carried forward is nearly double that of last year.

Success on an Old Machine.

We learn that in our report of the Mersey Motor Club's twenty-four hours' trial to Edinburgh and back we should have stated that A. Marston, who gained a silver medal, rode a 3½ h.p. Triumph, 1910 pattern, fitted with a single gear.

Motor Cycles in the City.

W. H. Elee, who will be remembered as a very successful rider of Rudge machines at Brooklands and in trials, has opened a branch of his Romford business in motor cycles at 16, Bishopsgate Avenue, London, E.C. This should prove of great convenience to those clients who are at business in the City.

For London Owners of Enfields.

It will be of interest to Royal Enfield motor-cycle users in London and the surrounding district to hear that the Enfield Cycle Co. have special arrangements for carrying out repairs to their machines at their depot, 48, Holborn Viaduct. So convenient have these arrangements proved that the company are contemplating making extensive additions to their workshop and staff.

Clynos as Prizes.

The County Chemical Co., Ltd., as already announced in these pages, are running a competition for users of Robbialac, a high-class enamel, which, if carefully applied, gives a result almost equal to stoving. All a competitor has to do to gain one of the valuable prizes is to buy a tin of Robbialac from a motor cycle or accessory dealer and paint some article or accessory with it. The best pieces of work will be rewarded by a prize of a 6 h.p. Clyno three-speed sidecar combination, 1913 model, of which there will be ten put up as prizes. The Editors of *The Motor Cycle* and *The Cycle and Motor Cycle Trader* have been asked to officiate as judges.

A TEN POUND NOTE

is all you have to pay to secure immediate delivery of any Motor Cycle on the market—the balance in 12 monthly instalments, commencing one month from delivery.

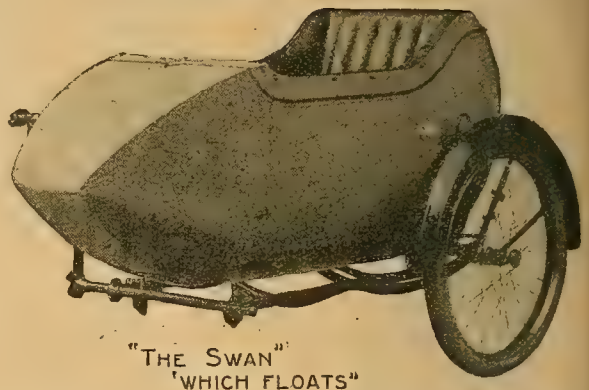
"THE SWAN."



"THE SWAN"
'WHICH FLOATS"

If you were purchasing a car to enjoy the travelling of many miles on the open road and to appreciate the delights of touring under all conditions, would you not first seek that which afforded comfort and protection, and then that car which was graceful and charmed other road users?—this would be the genuine touring car.

Would not the same occur to you in the **purchase of a sidecar?** The Swan is **genuinely comfortable,** does really **give protection, is sensibly roomy**—and yet still retains a most **charming appearance.** It is a **thorough touring attachment.**

Price of car is £13 : 10 : 0.

AMAC **AMAC**

"The Motor Cycle Journal of Canada," for April, 1913, says:—

COVENTRY CHAINS

"A large number of the racing machines in the States are fitted with **COVENTRY** chains. One rider, Ray Peck, used this chain on his mount all last summer and

DID NOT SUFFER A SINGLE BREAK

in any of his many races.

"THE COVENTRY" CHAIN CO., LTD., COVENTRY, England.

A lesson from the Isle of Man T.T. Races to Motor Cyclists.

The deserved success of the N.U.T. in the classic event of the year is as great a tribute to the determination of the man as to the proved efficiency of the machine which he piloted to victory.

Mr. Hugh Mason, far from being well, had unshaken confidence in the power and speed of the N.U.T. to acquit itself creditably in the competition, and his faith proved correct, for the

N·U·T

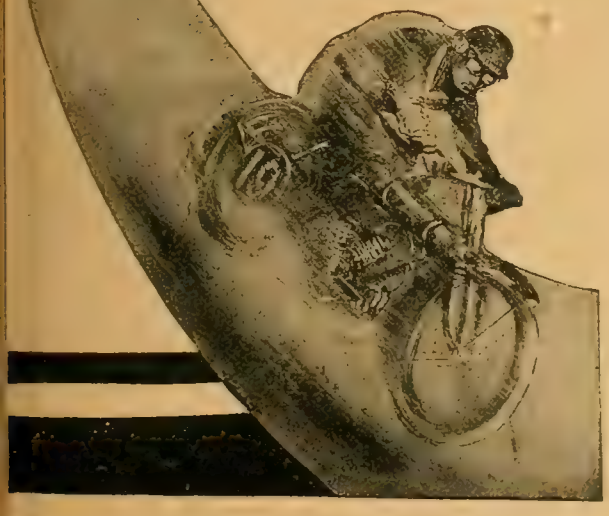
NEWCASTLE UPON TYNE.

WON THE JUNIOR RACE

AND ESTABLISHED ITS CLAIM AS THE MOTOR CYCLE OF UNEQUALLED EFFICIENCY.

Speed and enduring reliability are marked features of the N.U.T., and on this account it will assuredly render you a consistent service and complete satisfaction—always.

SIR WM. ANGUS, SANDERSON & CO., LTD.,
NEWCASTLE-ON-TYNE.



BURBERRY
TIELOCKEN COAT.

Illustrated Catalogue and Patterns of Gabardine Post Free.

When buying Burberry see that— The label says 'Burberry'— The bill says 'Burberry.'

BURBERRYS LATEST INVENTION for the Motor Cyclist or Motor Boatist—a double-breasted, buttonless coat, designed to provide unequalled security and comfort under the severest conditions.

BURBERRY WEAVE-PROOF GABARDINE, lined with proofed wool or camel-fleece, makes the Tielocken Coat a perfect safeguard against driving rain, chilling wind, dust, or spray.

LIGHTWEIGHT, YET WARM, Burberry Gabardine provides efficient protection against the worst weather vicissitudes, yet ventilates like ordinary cloth, thus preventing all danger of overheating or chill.

THE TIELOCKEN COAT, fastened with single strap-and-buckle, is easily put on or taken off. Worn with Trouserettes of Gabardine and Tielocken Gaiters, it supplies the finest protection available against the ill effects of exposure to wet or cold.

TIELOCKEN DUPLEX PROTECTORS, an application of the same principle, provide a four-fold yet airy safeguard of proofed Gabardine and proofed wool for keeping the knees and thighs dry in the heaviest rain.

PRICES: Tielocken Coat in Gabardine, lined proofed wool, 63/-; Gabardine Trouserettes, 31/6; Protectors, 15/-; Motor Cycle Cap, which can be readily transformed into a snug-fitting helmet, 15/-.

BURBERRYS Haymarket, LONDON;

8 and 10 Bd. Malesherbes, PARIS, and Provincial Agents.

12 months' Credit without interest.

That's Friswells' system of easy payments for Motor Cycles and Cycle-cars.

You pay ¼ of the amount down and the balance by 12 equal monthly payments free of interest.

Supposing you purchase a motor cycle costing £60. All you would have to pay down is £15 when you take delivery of the machine and the balance by 12 monthly payments of £3 15s.

Thus you purchase a motor cycle on the instalment system at cash price.

All the leading makes of Motor Cycles and Cycle-cars in stock and ready for immediate delivery. Write to-day.

LEATHER BEAD
CHROME

Nothing Like LEATHER

FOR PROTECTING TYRES AGAINST THE DEADLY ATTACKS OF RUST.

Leather defies rust as stoutly as it resists wear. The bead of the Cann Tyre is encased with the finest chrome leather in such a manner that not only is it proof against rust, but the rim is also rendered watertight.
The chrome leather bead increases the strength of the walls of the tyre as well, and with the high quality of the material employed in manufacture in addition, together with the thoroughness of workmanship which characterises Cann methods it will be readily appreciated that the Cann Tyre may be depended upon to render better service, longer mileage and greater satisfaction than any other make of motor cycle tyre. And it does.

PRICES: 26 x 2¼in., 48/-; 26 x 2½in., 52/-.
Send your broken beads to us. Retreading from 12/6. Rubber studded

RICHARD BURBIDGE, Managing Director.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To insure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Plan showing division of England into Sections.

SECTION I.
Northumberland, Cumberland, Durham, and Westmorland.

SECTION II.

9 SHOE LANE. FLEET STREET LONDON.E.C.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry" or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR BICYCLES FOR SALE.

T. BAKER and Sons, Friar St., Reading, have the following high-grade motor cycles in stock, all ready to ride away:

JAMES, 3½h.p., 3-speed, with Canoelet combination, used 300 miles only, full equipment; cost £82, price £62.

SUNBEAM, 2¾h.p., 2-speed, disc clutch, in use few weeks; cost £62, price £50.

TRIUMPH, 3½h.p., clutch model, all accessories, perfect condition; £35.

PREMIER, 3½h.p., 1911 model, equal to new; £30.

PREMIER, 3½h.p., 2-speed gear, just been overhauled by makers; £32.

DOUGLAS, 2¾h.p., twin-cyl., splendid running order; £25.

DOUGLAS, similar to above; £20.

MOTOSACOCHE, gent's, 1912 model, perfect; £25.

MOTOSACOCHE, gent's, just overhauled, good running order; £20.

MOTOSACOCHE, gent's, good order; £16.

MOTO-REVE, twin-cyl., just overhauled; £15.

LINCOLN Elk, 3½h.p., just overhauled; £20.

FOR Further Particulars of above machines, apply to Baker and Sons, Reading. [8823

LAYTONS'.—Sunbeam, 1913, 2¾h.p., 2-speed, kick starter, used 20 miles only; cost £63, price £55.—Laytons', Bicester, Oxon. [X1735

LAYTONS'.—Scott, late 1911 good condition, engine overhauled, lamp, horn, etc.; £35. Laytons', Bicester, Oxon. [X1736

LAYTONS'.—Triumph, 1913, delivery of two 3-speed models from stock; £59/15; exchanges, easy payments.—Laytons', Bicester, Oxon [X1739

LAYTONS'.—Scott, 1913, one machine just received; 65 gns.; exchanges, easy payments.—Laytons', Bicester, Oxon. [X1740

1912 Bradbury Mabon free engine clutch, new tyres and belt; £29, or nearest offer.—24, Southampton Buildings, Lymington. [X2422

1910 Triumph, free engine, lamp, new belt, tyres good condition; £33, or near offer.—Evans, 1, Berkeley Place, Cheltenham. [8806

ROYAL Enfield, 2¼h.p. twin, 1908, Palmer tyres, spares, perfect condition throughout; £18/10.—Dominy, 39, Jewry St., Winchester. [8970

MOTOSACOCHE, 2½h.p., 1911-12, bought May, variable gear, free engine, new back tyre and condition; £22.—Neal, Micheldever Station. [8933

HARTWELLS' Garage, Chipping Norton.—Triumph and Douglas agents; also agents for Swift cycle car for Banbury, Burford, and Chipping Norton.

TRIUMPH, 3-speed, 3½h.p., free engine, clutch; in stock; £59/15.—Hartwells'.

DOUGLAS model O, £48; in stock model R, £52.—Hartwells'.

ENFIELD Autolette in stock, £138.—Oxfordshire agents Hartwells'.

TRIUMPH, 1912, free engine, in fine order throughout, new 1in. Dunlop belt, lamp, horn, and tools; £39.—Hartwells'. [1786

T.T. Douglas, 1913, 2-speed, new, just delivered, unpacked; must sell, private reasons; cost £48 (old receipt produced); nearest offer £45.—Box No. 3,683, *The Motor Cycle* Offices, Coventry. [X2599

RUDGE, October, 1911, standard roadster, not done 4,000 miles, perfect condition, accessories; £37 Strickland, 7, New Rd., Reading. [8985

TRIUMPH, 1911, F.E., recently overhauled, carefully kept, perfect, excellent Dunlop, Pedley; 33 gns.—Vickers, Wychwood, Bournemouth. [9035

1913 2¾ Ivy-Precision, 2¾h.p., variable gear, free engine, in splendid condition, new Dunlop belt, lamp, horn, tools etc., complete.—Westfield House, Western Rd., Wolverton, Bucks. [9004

MOTOR BICYCLES FOR SALE.

Motor Omnibus Services.

IN the daily papers last week there appeared prospectuses of a company entitled Greater Omnibus Services, Ltd., which is to be founded with the idea of running motor omnibus services in different parts of England. The map issued with the prospectus shows the whole of the country divided up into circles of which large towns form the centres. It is proposed that these services should be run to the seaside, on populous routes, and between big towns, and it is anticipated that London to Manchester, or London to Brighton, will be possible by easy stages when the scheme is in working order. Now the motor omnibus is a very excellent vehicle. At the present stage of its existence it is as mechanically perfect as the motor car, it is no obstructor of traffic like the tram, nor does it run over greasy lines dealing death or destruction to riders of two-wheeled vehicles; it is in consequence an altogether desirable means of transport for the masses. It has, however, a very serious fault which all who have made its acquaintance on country roads know full well, and that is, it is a terrible destroyer of road surface. The reason for this is the weight of the vehicle, which causes tremendous pressure on the surface of the road. The pressure is more than the foundation of the road can stand, and soon numerous depressions are made. These cause the vehicle to rise and fall, and the result is that curious regular series of waves so frequently seen on a motor 'bus route, which correspond exactly to the periodicity of the springs. Unless steps are taken by those in authority the roads of England, which are now the best in the world, will be ruined, the motor car and motor cycle trades will dwindle and possibly almost vanish, as no self-respecting private individual will drive his car continually over bad surfaces. The question is one of the most vital importance to the motor cycle industry, as motor cycles are more susceptible to bumps than other mechanically-propelled vehicles, and the motor cycle more than the well sprung car needs good roads. The motor omnibus at present runs on cheap petrol and pays a reduced petrol tax, and all else it pays is the registration and local taxation licences, and perhaps also a licence to ply for hire. It is the local taxation licence which is inadequate, and in the case of vehicles of such weight as to cause serious damage to the roads the taxation should be arranged on a ton mileage basis, as this appears to be the only fair method. The present state of affairs is quite unjust, and it is quite unreasonable that vehicles which do excessive damage to the road surface should not pay their fair share towards road upkeep.

Racing Conditions.

IN pondering over our descriptions of the Grand Prix Race and the Six Hours' Race at Brooklands, the novice may be led to believe that motor cycles have not reached the state of perfection to which he has been led to imagine, and he may be pardoned for such a belief in view of the extraordinary amount of trouble experienced, especially in the Six Hours' Race aforesaid. Such a strenuous test, however, has not been held for some considerable time, and when it is considered that the race itself extended over a longer period than the memorable Tourist Trophy Race, the arduous nature of the test may be imagined. Brooklands stands out pre-eminently as the most gruelling test to which an engine may be put, and especially does this apply to an event extending over such a long period as six hours. It became tedious to the spectators to watch, but what it was to the engines which were forced along at their utmost speed from the moment of the start can best be imagined. In other words, the test was an abnormal one, and consequently what might be termed abnormal design and devices were pressed into service to obtain the maximum possible speed. It was largely in connection with this abnormal design that trouble was experienced. We refer to the extremely high compression ratios used on racing engines, which accounted for cylinder troubles in one or two cases, and plug troubles in others. Again, the retirement of one or two was due to the breakage of a piston ring. It is well-known that on racing machines in order to reduce friction to a minimum seldom more than a single ring is used, and the strain upon that ring becomes very great. The more one considers racing results from an instructive standpoint, the more one is convinced that an engine which can stand a long-distance record-breaking test, on Brooklands in particular, is one of absolutely proven reliability. Those who entered and were not successful will undoubtedly have learned a great deal by their experience. It is a remarkable fact that an engine which will continue to give satisfactory service under ordinary touring conditions for thousands of miles will not stand up under the strain of a long-distance race at Brooklands.

Fighting Consumption with Motor Cycles.

AS a result of an experiment made in Wisconsin last summer by the Wisconsin Anti-tuberculosis Association, motor cycles are employed in that State to good advantage in the crusade against the Great White Plague. A rural campaign has been started by the use of a motor cycle which is perhaps the most novel venture of its kind ever attempted.

Two health crusaders, a lecturer and an assistant, work together. They would compare with a knight and his squire of olden times, except that they both ride on one steed—a petrol-fed steed—and differ from the knight of old in that they are independent of the hospitality of castles or monasteries, for they carry a complete camping equipment, and do their own cooking.

The work consists of placarding the country with health signs and giving talks at creameries, country cross roads, and small villages; in fact, wherever a crowd can be assembled. A village is usually chosen for an illustrated lecture in the evening. Stereopticon views are a feature of this talk, which is usually given out of doors. The stereopticon is operated from the luggage carrier of the motor cycle, being connected with the generator which supplies the head light. The expense of this work is comparatively small, since hotel bills are eliminated. The ground can be covered rapidly, and no time is wasted waiting for trains. As many people can be reached in the country in this manner as by the ordinary lecture tour through cities.

The lecturers mounted on their Harley-Davidson machines. Note the amount of camping outfit on the carriers.

Scene in camp.

POINTS ABOUT CYCLE CARS AND FURTHER HINTS FOR BUYERS.

FIRST we may divide cycle cars into two classes irrespective of the number of wheels: (1) the motor-cycle-car (to coin a word) and (2) the small car, for that is really what the more ambitious vehicles of this class are.

Now in my opinion and experience, if a man has graduated on a motor bicycle, he can buy with safety and successfully run one of the former class or the motor-cycle-car. In construction and method of handling it resembles a motor bicycle, with its belt drive, air-cooled engine, etc. It requires careful driving and looking after, and though it provides more comfort in position and weatherproofing than a motor cycle, yet it is not so nice to drive on rough roads as the latter, nor will it stand careless handling and constant speed work. My experience of a good make of this class was that, after a time, vibration loosened everything on the machine, and the amount of tinkering and overhauling necessary to keep it in safe condition was very great indeed. This is partly due to the light weight.

The second class of vehicle, or what I have called "small car" type, is a vast improvement on the other, but, and here is the rub, if makers turn out a vehicle costing up to £160 to £180, surely it is quite wrong to class this with cars costing £125 at the outside? There are several small cars on the market, with engines under 1,100 c.c., but the A.C.U. do not recognise them all as cycle cars since they base their definition partly on weight. This weight question is very important. A vehicle weighing 7 cwts., *e.g.*, is very much more comfortable to ride in than one of 4 cwts., but is naturally more expensive to run, petrol and tyre bills being heavier.

It comes to this, then. A man when buying a cycle car has to decide whether he wants luxury with more expense but far less time spent in tinkering, etc., or whether he will be content with an elaborated motor bicycle in which he can keep clean, but which will not give him the average speed of a sidecar combination. As regards the number of wheels: four means big tax but low tyre upkeep; three means big tyre upkeep and small tax. If his yearly mileage is small, a three-wheeler will serve him well, and he will save on it. If his mileage is big he will have a big tyre bill. I drive a 7 cwt. three-wheeler, and my back tyre gives up the ghost at 1,000 miles, but can be retreaded. Two more points for buyers: for preference do not have a sheet iron body, it rattles; nor external contracting brakes.

MUGWUMP, M.B.

REFLECTIONS on the GRAND PRIX.

PRACTICALLY everyone who crossed the Channel to witness the Grand Prix saw both the car and motor cycle races, the two events being arranged so conveniently on successive days. There is no doubt that racing, particularly motor racing, is taken up most thoroughly by the French. Hundreds of pounds must have been spent on the stands, the barricading of villages, the special sheds, and the building of special roads, to say nothing of the treatment of the whole of the road surface with calcium chloride to prevent dust. No time is taken up in swearing in the police; the troops are simply ordered out, and they guard the course with fixed bayonets—and they do it thoroughly, as the writer can testify. French roads are ideal for speed work, and probably better adapted for the purpose than Brooklands even. At any rate, the waves which set up the Brooklands wobble are non-existent. But why do they start races so early on the other side? Closing the roads at 4 a.m. meant rising before three o'clock to those quartered in Amiens. The *cafés* and restaurants kept open all night for those who did not relish the idea of paying twenty francs for three or four hours in bed. Sleep was almost out of the question, for there was a continual stream of cars passing through Amiens, and the favourite car in France is a sporting model of about 40 h.p., and a silencer is a thing almost unknown. To add to the din, the noisiest of electric horns and syrens contribute their part. Strangely enough, exhaust whistles do not appear to be favoured. The official enclosure for cars cost ten francs, and by the time the race commenced there was a collection of cars probably never equalled. There was a goodly number of motor cyclists among the procession, which formed one long line of five miles from Longneau to Amiens, but they were not happy on their machines, for the ride entailed 200 of 300 restarts. A great many car owners slept in the backs of their cars; I was told that there were dozens of fires burning all night at different points of the course.

It was generally agreed that the car races were the more exciting, most probably on account of the high speeds attained and the lurid corner work. As a cycle car owner, I was most particularly interested in the Sunbeams with their solid rear axles, and I must confess that from my observations on corner work the absence of a differential does not appeal to me strongly. It was patent to the eye that the Sunbeams skidded round the corners more violently than any of the other competing cars, excepting, perhaps, the Italas, which were obviously too lightly sprung. It will be interesting to see if the Sunbeam Co. continue to dispense with the use of differentials on their racing cars.

The Motor Cycle Race.

One would have liked to have seen a Scott among the motor cycles, for, with ordinary luck, its pleasing running would have created a lasting impression on the spectators, representing many nationalities, who witnessed the racing. Besides, the long straight stretches gave a chance to the fleetest machines, there being far fewer corners than in the Isle of Man. The French competitors generally favoured overhead valves, and I noticed that each time a stop was made for petrol and oil a handful of grease was applied to the outside valve mechanism. Still we find leather belts favoured, and as for mudguards, stands, and luggage carriers, they are not the staunch and rigid kind which Englishmen would demand. The M.A.G. engines were admittedly the fleetest on the course; their riders' only fear was as to their ability to stand up for so long a distance at full speed.

Towards the end of the motor cycle race one could have imagined one was in the Isle of Man, so strong was the British element in noting down the leaders. The Rudge, Triumph, and B.S.A. contingents had a magnificent three-cornered duel, with an occasional anxious glance at Fenton on the marvellous 350 c.c. Clement-M.A.G., which could hold its own with any machine on the course. It must be said that the Rudge victory was a popular one, despite that it was

Reflections on the Grand Prix.—

accomplished on foreign soil. By the way, the A.C.U. might well copy the idea of having a slip road for the finishers; this would stop the attendants running on to the course, and the temptation to press photographers to rush out and take snapshots. Now I come to think of it, Wood and Abbott automatically made the straight at the top of Bray Hill the slip road in this year's T.T.; and I doubt if a better spot could be found.

M. Bourbeau, maker and driver of the winning Bedelia in the Grand Prix Race.

Another point is the arrangement of a single depot in front of the grandstand. If spectators can see all that is happening, and can follow the race closely, they do not object to paying a good price for a comfortable seat in the stand.

The scoring board was very neatly arranged. Instead of a painter obscuring figures whilst he put others up, the Frenchmen slipped cardboard numbers into slots, and merely spun the board round on its spindle as each new lap time was known.

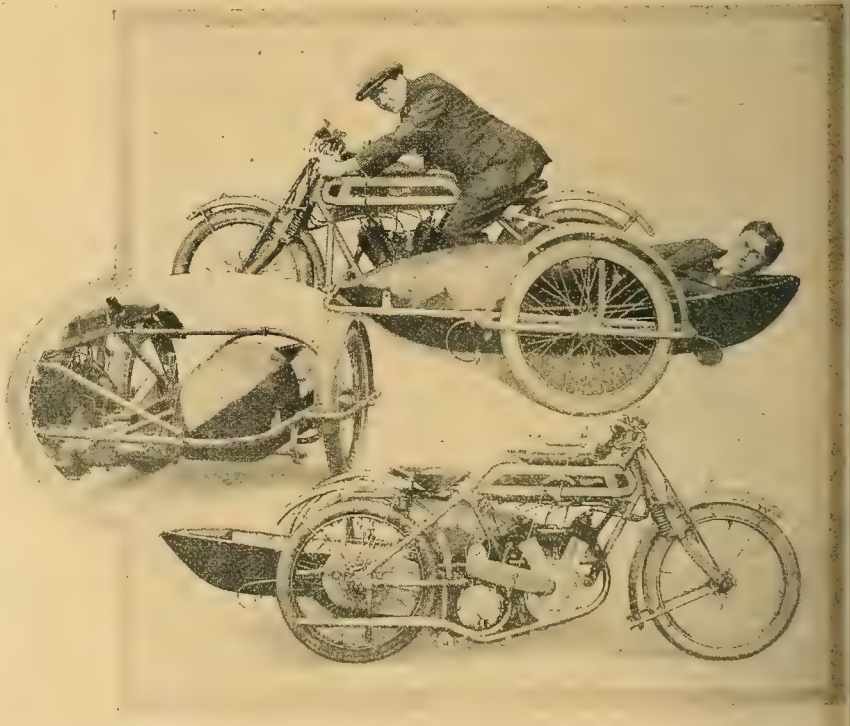
The Cycle Cars.

The fun there was when the long, low spit-firers set off! Strangely enough, none were quick off the mark, but after turning the corner they disappeared at a rattling pace. Mundy had very hard luck in crumpling up a front wheel; Harry Reed was his passenger, and they both thought they were going to make history, as the twin Green engine was going great guns. Morgan himself put in a lot of time and trouble for nothing; the brilliant success of McMinnies consoled him, however. Nash, in setting up second fastest lap on his G.N., did wonderfully well; as he had no knowledge of the course, for he crossed with us only two days before the race. I liked the Mathis and the Rontéix in particular. The former had a four-cylinder *monobloc* engine with valves all on one side, their heads no bigger than a shilling. The detachable wheels came in handily when tyre troubles occurred. The Bedelias with their 90° engines were the real surprise packet, for when Bonville caught fire Bourbeau was ready to take his place. The Violet friction-driven car had a fine turn of speed; but what a lesson it will be to attendants not to jump about and wave their arms as if they had gone dotty, for it may be recollected that the long-bearded Violet on his last lap stopped to enquire what was wrong, and thereby lost first place by eight seconds. He was, however, the moral winner of the race. Both the Violet and the Rontéix had solid axles and chain drive, but they were inclined to skid on corners.

A Representative British Entry Wanted.

I have never been a firm believer in belt drive on passenger machines, but it must be confessed that the belts stood up remarkably well in the Grand Prix. It would not, however, do to say that the strain could have been borne much longer. I saw one leading car at the finish with a belt missing, and the other had turned over in the pulleys and had long whiskers of rubber, so evidently another lap would have spelt trouble.

Let us hope that next year the entry will be more representative, as British victories abroad cannot fail to do good. In particular we should like to see some of our speedy sidecar men. The sidecarists did very badly. After the Regal-Green's ridiculous disqualification owing to a missing mudguard, and Barnes' wretched luck, the sidecars were "out of it," though two, a René-Gillet and an N.S.U., did succeed in completing the course. Of course, officially, the Morgan ran as a sidecar, but all the same the great mass of spectators refused to look upon it as belonging to that category; and certainly there was very little of the sidecar, as usually understood, about these speedy little runabouts. G.S.



The Grand Prix Clyno which Frank Smith was to have driven on the Picardie Circuit, but could not do so owing to illness. The sidecar is arranged for the passenger to lie flat. The machine has been specially lightened where possible and is very fleet. We should not be surprised if records were attempted on it very shortly.

OCCASIONAL COMMENTS ::

By IXION

The Future of Counter-shaft Drive.

Some of my readers have been enquiring whether ave lost my enthusiasm for the counter-shaft drive. ey say that a few years ago it played King Charles's id to my Mr. Dick, and that lately I have been nt about it. Well, I have not been false to my e. The plain fact is that the two-step chain-cum-t drive reduces belt troubles and increases the belt as much as ever it did; but it was a little rash imagine that it could be transferred from the hori-ital twin-cylinders of 350 c.c. (which created the nand for it) to the 500 c.c. single without necessitat-modifications. Well as this drive serves on the ittle twins, it is inconceivably harsh on a 500 c.c. gle unless a slipping device is fitted on the crank-ft. In view of its undoubted advantages, one may pardoned for expecting the 500 c.c. single-cylinder gade to produce cushioned engine sprockets with all ssible speed, but they seem to find the difficulties her more prodigious than one would imagine. How-r, some of them are taking to the two-step, and we e the others will toe the line one by one. In the antime, why do not they do the next best thing, and p the 7/8in. belt in favour of the 1in.? The 1in. t has no obvious drawbacks, barring a fractional rease in cost, and the contrast between it and the n. is quite ridiculously large in use.

Factory Repairs versus Agency Tinkerings.

The average amateur does not seem to have sense ough to comprehend that in ordinary cases an agency y be a good place whereat to purchase easily fitted ares—exhaust valves, for instance, but that the tory is *par excellence* the right location for real pairs. An agency probably keeps one or two chanics, who in some cases have no special know-lge of the machine they must handle; they repre-nt floating labour—here to-day and gone to-morrow. it if a repair job is sent to the factory, it is dealt th by men who are permanently employed on that rticular make, and it is tested before despatch by en who live on similar machines; moreover, the tory take a permanent interest in their clients, ereas an agent may change his contract every year less he has got hold of something very first-class. his reasoning actually applies to some of the London depots" as well. A friend of mine took s machine to the London depot of quite a decent m. He left it with them for no more than eight urs, and the only material they used cost about 2s. holesale, but the bill was 28s., and the machine re-veloped its old faults within fifty miles of town. hen I was called to the rescue I found it possible to dismantle the faulty portion of the mechanism in ten minutes—it took me more than that the first time, by a good margin, but as soon as I knew how it dove-tailed together, I could whip it on and off in a very few minutes. Certain new parts were obviously advisable, and so I detached the mechanism for him, and this time he sent it by post to the factory. Riders find themselves in rather a cruel dilemma when the entire machine has to be sent somewhere, and the agency is down the street, while the factory is anything from 100 to 5,000 miles away—pity the poor colonial. But when recourse to the factory is possible, I vote for the factory every time; and in most cases the factory charges will be lower than the agent's, which is a genuine consideration.

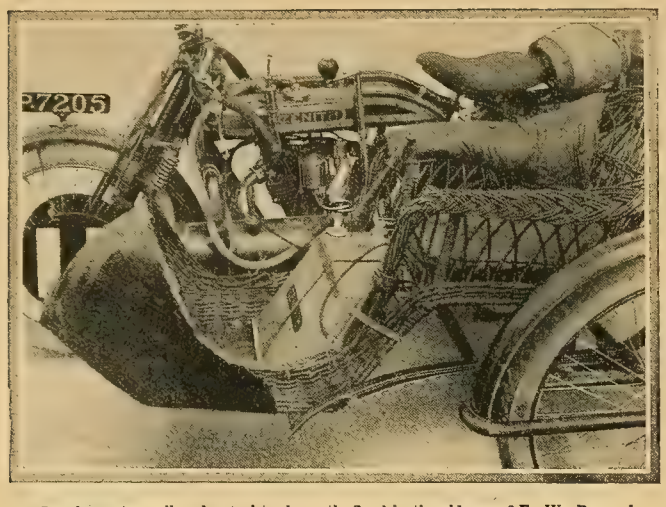
Belt-driven Speedometers.

The Stewart speedometer people wish me to explain that the belt-driven model, to which I referred recently, is made for the American market only, and is not imported into Great Britain. I drew attention to it simply as a remarkable innovation of some public interest, and am glad to make this explanation. I suspect it owes its origin to the well known difficulty of fitting shaft-driven speedometers to certain types of spring forks which are very popular in the States, but this solution of its origin only occurred to me last week, when I happened to study the complex mountings necessary to adapt a well known British instrument to an Indian machine.

Motor Bicycle Footrests.

The trade are not too pleased with my strictures on sundry types of footrests, which struck me as far from perfect, but the resulting correspondence only contained one statement of any real defensive value. One designer told me that the outer section of his two-piece adjustable rest was made tough to prevent more vital portions of the mechanism receiving serious injury in the event of a fall. I think I can answer him. A friend of mine put one of these machines in one of those strenuous trials where a bent footrest at the finish spells a loss of "condition" marks. He is one of those clumsy individuals who takes a toss at one of every ten unfamiliar blind corners, and whose footrests are invariably in a bent and twisted condition. As there are four footrests on the machine in question, he foresaw that he would lose twenty "condition" marks in the trial in question, and that his gold medal was past praying for unless he took some strenuous action, so he made one outer section for each of his four rests prior to the start of the trial, and he saw that each rest was made of specially bendable steel. He took about his usual percentage of tosses in the course

Occasional Comments.—



Supplementary oil and petrol tank neatly fixed in the sidecar of F. W. Barnes's Grand Prix Zenith. Pressure is supplied by two tyre pumps situated one on each side of the sidecar and operated by the passenger.

of the event, but was able to kick the rests sufficiently straight to pass the judges without penalty. I think the facts are really as follows: In the case of a genuinely serious tumble, the strongest rests will scarcely avail to reduce the injuries the machine is likely to receive, but at least 75% of our tumbles are of the very gentle and minor order; in these a very light and bendable end to the footrest will suffice admirably to defend more vital parts, and retain the advantage of being easily straightened. Hence I continue to plump for a strong central footrest carrier with good frame bearing, and to clamour for light outer extensions of a very simple design, carried out in flexible steel; by "flexible," I mean, of course, "flexible cold."

The Lubrication of Three-speed Hubs.

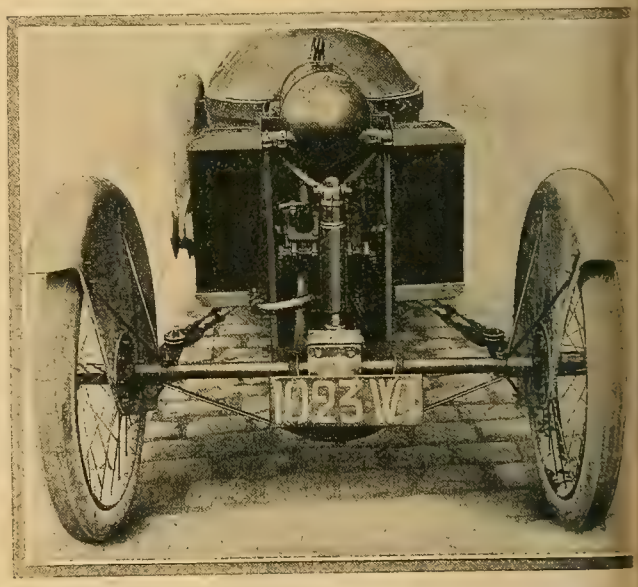
Makers of three-speed hubs are insistent in their warnings that only a thin push-bicycle lubricant should be used for oiling their gears; but many riders and mechanics, who ought to know better, are in the habit of squirting in a dose of the first oil that comes to hand. It is a sound notion to oil these hubs with the engine running and the clutch out. It ensures the oil penetrating into all the corners of the mechanism, and avoids those subsequent drippings which disfigure the rear part of a machine, and are so destructive to tyres. The thing to remember in oiling these gears is that the maxim, "little and often" is the ideal policy, a teaspoonful daily is the right dose.

The Three-inch Tyre.

I have received some letters which I regard as rather nonsensical, alleging that a 3in. tyre sustains many more punctures in a given mileage than a 2¼in. because it covers more of the road, and so mops up more tacks and nails and bits of wire. Although the correspondents in question claim more road experience with 3in. tyres on bicycles than I can boast, I venture to question their conclusions. A 3in. tyre covers very little more road than a 2¼in., and this extra contact area should be more than cancelled by the additional thickness of the covers. Let us put it this way. Car practice has proved beyond question that the larger the tyres the fewer the punctures. (I know a car which suffered horribly from punctures on 90 mm tyres for its first two years; it was then put on 100 mm. tyres, and has not sustained a puncture for two years.) Well, the 7 h.p. Indian was not peculiarly susceptible to punctures in the days when it was shod with 2½in. tyres; and it is counter to all experience to suppose that it could conceivably be more liable to punctures now that it has 3in. tyres. My correspondents must form a very tiny percentage of Indian users: the probability is that they are drawn from the unlucky percentage whose tyre luck happens to be dead out this year; or that they have got hold of a dud set of tyres. At any rate, I will guarantee that the increase in tyre sizes has nothing whatever to do with the frequent punctures of which they complain.

Holes Splitting under Tyre Patches.

I alluded recently to a suspicion that modern patches and solutions were almost too good for the type of rider who is a "tramp on tyres," and rides a pair to destruction. An experienced informant tells me that he found the original hole widened and split beneath the patch, and that it was next to impossible to remove the patch. I retorted that it was hard to see why the hole should widen if the patch were made to adhere over its whole surface. I have had a lark and confusing medley of opinions on the point from many correspondents, and it is clear to my mind that it all depends on the quality of the tube. Several readers say that I have exactly voiced their own experiences: while one tells me of a Rich tube which bore the honourable scars of no less than thirty-nine patches after 20,000 miles, all of which were successfully removed, and revealed the fact that the original holes still retained their pristine dimensions. Evidently if the rubber is cooked to a turn in manufacture, it does not evince this tendency to split. I doubt whether the average private rider resorts to heat for the removal of old patches; heat, of course, is commonly employed for the purpose in tyre repairing works.



One of the Bedelias in the Grand Prix had a water-cooled engine, though an air-cooled car won. Our photographer shows the neat method of mounting the radiators, pannier fashion.

PAY AS YOU RIDE.

How Running Expenses are Increased in North Wales.

THE motor cyclist in the Mersey district is well advised to see that his outfit of spare parts includes an assortment of copper and silver coin of the realm, and that the supply is carried in an accessible place, unless he wishes to be continually undoing his overalls to produce that necessity for the safe passage of toll bridges and ferries which abound in this neighbourhood.

Should he decide that a run to Holyhead and back is his objective he will very soon begin the distribution of his small change. We recently had occasion to journey over this route with a sidecar outfit, and for a start we were mulcted 8d. for the sidecar's conveyance to Birkenhead by the ferry. We proceeded without further outlay till we reached Queensferry bridge, where we were bereft of 9d., after which the mere 3d. demanded by the toll authorities at Conway bridge seemed a trifle of no consequence, but we were reminded of the existence of costs on the higher scale on our arrival at the Menai Straits suspension bridge, where 6d. more of our capital was collected.

This brought our little run to Holyhead to a cost of 2s. 2d., in addition to usual running expenses. If one returns to Liverpool the same day free passage on the return journey is allowed at the various tolls and bridges, but if, as in our case, the night is spent at Holyhead, a fresh disbursement on the morrow is demanded. We also committed the financial indiscretion of returning *via* the Marine Drive at Colwyn Bay, for which pleasure we were charged 6d. By the time, therefore, we had returned to Liverpool our little journey had cost us 4s. 8d. in tolls and ferries.

No one would object to paying a reasonable sum towards the upkeep of these bridges, but as a motor cycle certainly does as little damage to their structure as a cycle, more leniency in the charges might reasonably be expected. In addition, the majority of the roads in this part of North Wales are in a shocking condition, and about the only satisfaction the motor cyclist wayfarer gets hereabouts for his money is a magnificent view. Though it is possible that one may pay too dearly for even this privilege.

Praise for Military Motor Cyclists.

THE motor scouts of the Sherwood Rangers Yeomanry have just finished their annual training with the regiment at Coddington Camp, Newark. They are a comparatively new feature of a Yeomanry regiment, but experience has already set the question of their utility beyond all doubt. Capt. J. D. F. Wodehouse, in writing of their services subsequently, says: "Since we have now become used to motor cyclist scouts we feel them to be absolutely indispensable."

Several extended field days were carried out, notably one in a scheme against the South Notts Hussars in the Southwell direction, and another in conjunction with the South Notts. Hussars against the Derbyshire Yeomanry; and there were other regimental days. On all these occasions the available motor cyclists were jealously divided up between the regimental and various squadron commanders and were made use of to the very fullest extent. Behind the screen of horsemen of patrols and covering troops, motor cyclists hummed backwards and forwards between the Commanders, carrying messages and orders. The Regimental Commander could keep in touch with his farthest squadron, and knew what was happening to it almost as soon as the squadron leader himself. It was described as being almost like sitting at a desk with a telephone receiver at the ear.

This service of despatch riding was carried out very well indeed. The motor scouts seldom seemed to take a wrong road or lose their way, and the capture of one of them by the enemy was a very exceptional occurrence. If they were ever captured it was due to the misuse of them, for though we have gone a long way towards understanding what is their proper sphere, the lesson that they cannot be used for purely scouting purposes has not yet been quite perfectly learned.

Apart from the field days the motor scouts were most useful at camp, one being always detailed for duty at Orderly Room, to take messages and telegrams, etc., and plenty of use was made of them in this way.

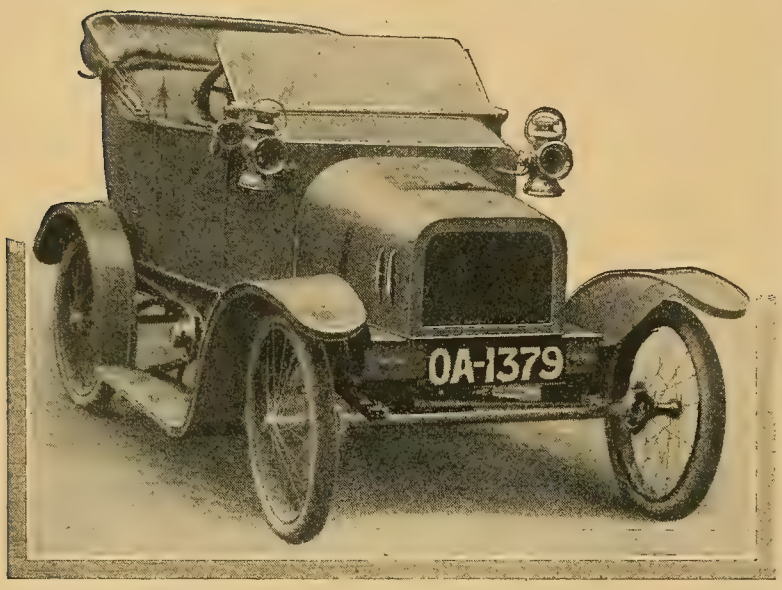
Corporal Allison Clark is to be congratulated on the Sherwood Rangers Motor Scout Section.

A 3½ h.p. Bradbury and sidecar which proved very useful at the Yeomanry camp at Folkestone recently.

Motor cyclists of the Sherwood Rangers Yeomanry. Left to right: Cpl. Allison Clark (B.S.A.), Pte. Jackson (Douglas), Pte. Richmond (Bradbury), Pte. Ford (N.S.U.), Pte. Wordsworth (Triumph), Pte. Broadburry (Enfield), and Pte. Coney (Enfield).

THREE NEW LIGHT CARS.

THE ARMSTRONG, THE WINCO, AND THE GORDON.



The 8 h.p. Armstrong, a belt driven cycle car from Birmingham.

A NEW cycle car of the belt-driven variety has lately made its appearance on the market, and is known as the Armstrong. The power is supplied by an 8 h.p. twin-cylinder air-cooled Precision engine of 964 c.c., and the drive is transmitted to a two-speed Chater-Lea gear box by chain, and thence to the back wheels by two belts of the usual V section. A plate clutch, self-lubricated from the engine, is fitted, and the mixture is fired by a Bosch magneto, while a choice is given of either a B. and B. or Amac carburetter. Quarter elliptic springing is utilised fore and aft, and the makers claim a speed on the level of about 40 m.p.h. and a petrol consumption of about 48 m.p.g.

In our opinion, the first of these little vehicles is rather overbodied, and although it is well to offer the purchaser as much comfort and protection as possible, it is highly desirable that vehicles of this description should have as light a load as possible thrust upon them. The mudguards are excellent, being stiffly built and fitted with lips and valances. The price is £95.

The 8 h.p. Water-cooled Winco.

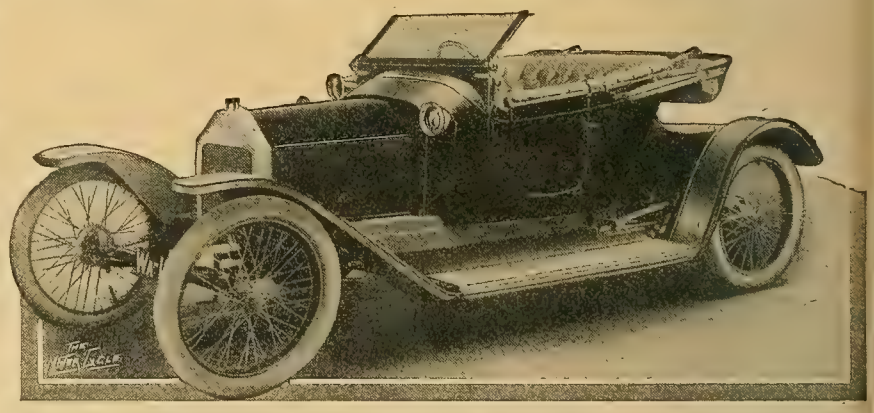
MESSRS. Stringer and Co. (Sheffield), Ltd., who have for many years specialised in the production of crankshafts, connecting rods, and other steel parts used in the construction of cars and motor cycles, have now turned their attention to the production of a cycle car on car lines. Our illustration gives an excellent idea of the lines of this little machine, the *carrosserie* of which is quite admirably carried out, particularly sound mudguarding being furnished, a point which is well worth mention, as the low build of most little cars of this type renders it imperative that the passengers should be well protected from splashes. The presence of long footboards, between which and the frame valances are fitted, will be appreciated.

The power unit is a twin-cylinder vertical water-cooled motor, 85 mm. bore × 93 mm. stroke (1,080 c.c.). The crankshaft runs in phosphor bronze bearings, and the solid camshaft is chain-driven from the crankshaft, as in the latest car practice.

Automatic lubrication by pump, driven from the camshaft, is employed, and an automatic carburetter is fitted, which is claimed to afford about forty-five miles per gallon of petrol. Thermo-syphon circulation of the water is relied upon.

The three-speed and reverse gear box is bolted direct to the rear axle casing, as is now the case with several other cars, both large and small. The makers claim that their gears are absolutely to be relied on, even under the hardest tests, and as the firm have been producing gear wheels for the trade for a number of years, their great experience in this branch of manufacture should stand them in good stead. Ball bearings are employed throughout the transmission system.

The steering is of the irreversible worm and nut type. The springing of this little car has been very



The new Winco light car, which is being manufactured in Sheffield. It is particularly well turned out as regards equipment.

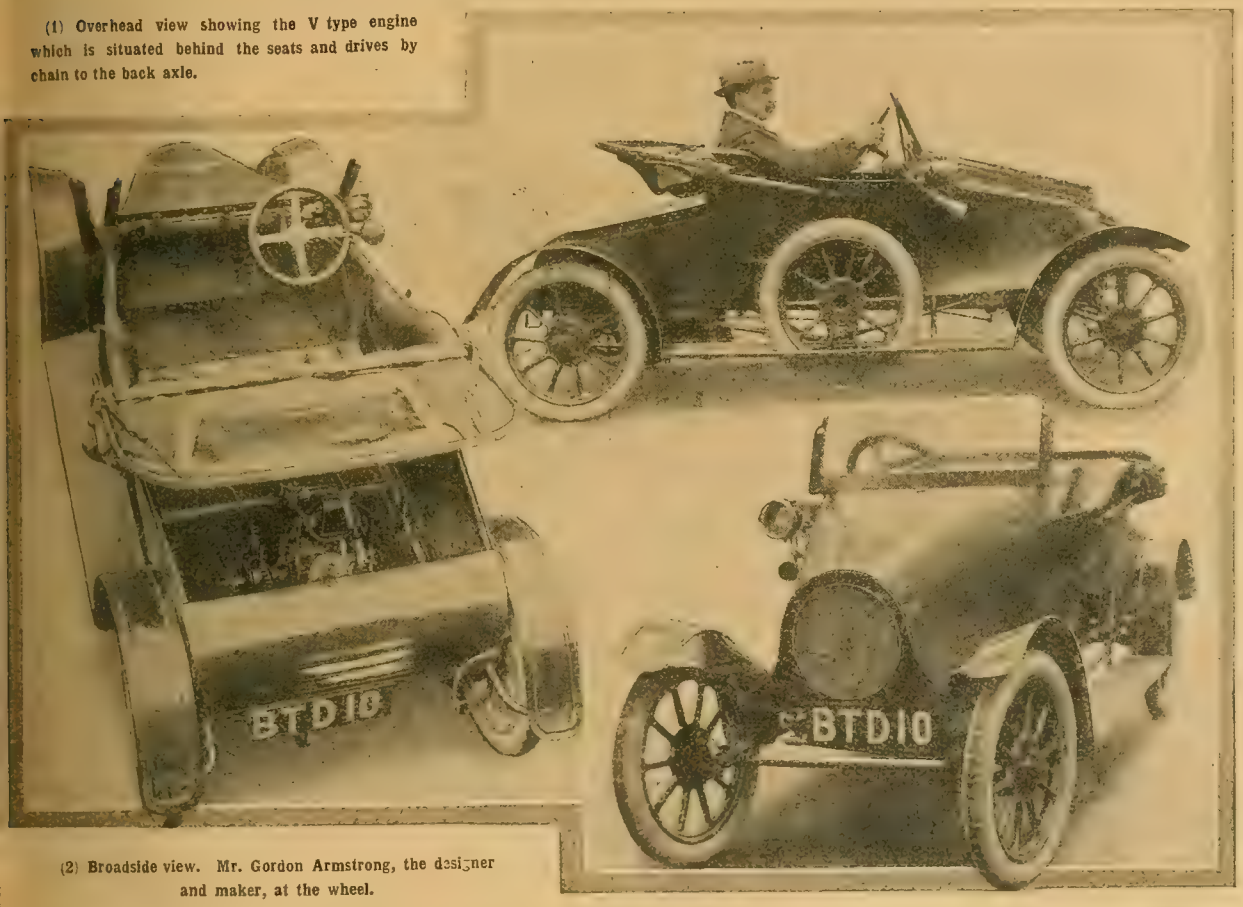
ıree New Light Cars.—

ırefully thought out, and this is a most important ɔint, for it is difficult to make cycle cars keep the road ɔmfortably at their best speeds owing to their light eight and speed. With this idea in view the esigners of the Winco have employed semi-elliptic ɔrings. Both front and rear axles slide on the ıds of the spring, which are pivoted centrally on ıe steel-strengthened ash frame, while at the other end of the springs shackles are fitted. Radius rods are utilised for both front and rear axles.

Altogether the design has been carefully studied, and although not among the cheapest in its class, for it costs £165 completely equipped as illustrated, with the addition of two head lamps, it should prove excellent value. We have not yet had the opportunity of trying the "Winco" on the road, but look forward to putting it through its paces.

The Air-cooled 90° Gordon.

(1) Overhead view showing the V type engine which is situated behind the seats and drives by chain to the back axle.



(2) Broadside view. Mr. Gordon Armstrong, the designer and maker, at the wheel.

(3) Front view showing distinctive appearance.

EFFICIENCY in transmission has been the aim of the designer of the new model Gordon 100 guinea cycle car, manufactured by the East Riding Engineering Works, Beverley, Yorkshire. With this end in view, the makers have placed the power unit, which consists of a 90° twin 9 h.p. J.A.P. engine, close to the rear axle, the drive being carried by a single chain to the live axle through a two-speed and reverse epicyclic gear. This arrangement has the further advantage of keeping the weight well on the back wheels, a highly desirable trait in these light vehicles, as it reduces tyre wear and increases comfort by preventing bouncing. Both brakes operate upon the rear wheel drums.

In one way this little vehicle is aiming at being very up-to-date, in that it is fitted with a self-starter, or, more strictly speaking, a device is fitted by which the engine may be started from the driver's seat. This should prove a great boon, especially in wet weather. Speeds of 45 m.p.h. are claimed, and the directness of the drive is stated to produce great fuel economy, as much as sixty miles on one gallon being possible, the makers inform us. One of these machines is competing in the Scottish Trials this week.

Cycle Cars v. Sidecars.

Sir,—Some time ago a contributor to your paper playfully remarked that he did not wish to be cruel, but he would like to know how the Morgans fancied competing against the sidecars in the Grand Prix. We could have replied that we were perfectly satisfied and not at all alarmed at the prospect. Now that the race is over we certainly have no reason to be dissatisfied, for, apart from the fact that we made faster time than any cycle car, we won the race over a course which not a single sidecar was able to survive. Our answer to your contributor is late, but we trust conclusive. We waited for results.

MORGAN MOTOR CO., LTD.

Climbing Branscombe Hill.

Sir,—Referring to Mr. H. Mellor Jameson's letter in your issue of July 10th, in the first place the paragraph referred to by him does not state that I claim to be the first to climb Vicarage Hill. I am not very well acquainted with the part of the country in which this hill is situate, and have therefore communicated with the member of the Exeter Motor Club who was my passenger on the occasion when I climbed Branscombe Lane, and he informs me that Vicarage Hill is not the same as the one I refer to. I understand that Vicarage Hill is on the lower road, whilst Branscombe Lane is a very steep, narrow, stony lane on the upper road, farthest from the coast. The date I climbed the hill was Saturday, June 21st, of this year.

WILLIAM H. CARSON.

How I Made a New Engine "Rev."

Sir,—It is with great fear and trembling that I dare to offer slight criticism on the article by "Road Rider" in your issue of the 10th inst., and may I be forgiven for asking the following questions:

Won't "Road Rider," after so much second gear work and liberal oiling, clean away the accumulation of carbon before 2,000 miles are covered? And won't the big and little ends, etc., after taking the opportunity provided by every secluded mile of straight road to drive the engine all out on a 6.6 to 1 gear, be run *out* instead of run in, under the present system of splash or *splosh* lubrication?

I have generally found that, after carefully tuning up to this mileage, it is getting perilously near the time to upset many of my adjustments by having the whole contraption down for replacements; and twins—oh, my word!—the front cylinder gudgeon pin goes home in—well, the less said about it the better.

It is positively awful to the mechanical mind that such a splendid piece of engineering as an up-to-date motor cycle engine should be lubricated by such a dot-and-carry-one method with enclosed flywheels.

Mechanical force feed to all main bearings is what is wanted, such as the W.D. (for whom I hold no brief), *not* mechanical to crank case and then by *splosh*.

When this day arrives, which will not be general until motor cycles stop selling like hot cakes, one motor cyclist will be able to say to another: "My bearings are in lovely condition—just run in."

No. 2: "Oh! What's the mileage?"

No. 1: "2,000."

H.U.

Lady Motor Cyclists.

Sir,—I shall be grateful if you will allow me to seek through your columns the advice of your readers who have had experience in riding a lady's motor cycle.

As school nurse, spending five or six hours per day in visiting over an extensive district (one quarter of Cheshire) on a pedal cycle, almost daily, five days per week, eleven months of the year, I feel impelled to get a motor cycle but I want first to get some idea of the probable cost of upkeep, etc.

I have less than £30 per annum to cover cost of motor cycle and upkeep. I lead a busy life, and have neither time, ability, nor inclination to keep the machine in order, so even small repairs and cleaning would have to be reckoned in.

I am not keen on speed, but want to cover the ground and face nearly all kinds of weather with the least amount of trouble and expense. If any readers will give experience of annual cost of upkeep, and any hints likely to be useful they will have the gratitude of

A WOULD-BE LADY MOTOR CYCLIST.

The Motor Cycle for Business Purposes.

Sir,—Although I agree with your correspondent, Mr. C. E. Turner, that "T.H.B.A." has considerably underestimated the tyre expenditure on a 6 h.p. sidecar combination, I cannot but think that his (Mr. Turner's) unfortunate experience with tyres is largely due to his choice of the wrong makes. I have covered 10,000 miles, over every kind of road, on my 6 h.p. Zenith, used practically always with a sidecar, and have tried numerous makes of tyres. Some of them have given very satisfactory results. For example I am still using a 26×2½ T.T. Hutchinson cover on my front wheel which has covered 5,350 miles and cost 37s. On the sidecar, I have just taken off a 16s. Michelin which has done almost 5,000 miles. The driving wheel naturally uses up tyres sooner, but a 2½in. Michelin-Semelle cover costing 45s., gave a mileage of nearly 3,000. At present I am running a Stelastic cover, costing 56s., on this wheel and it looks little worn after nearly 1,800 miles. I hope an intending recruit to the ranks of motor cyclists who has been alarmed by Mr. Turner's letter will be reassured by my more fortunate experience. There is no doubt that the best of makers sometimes turn out a faulty tyre, but my experience is that they are usually quite willing to "make good." Since I am so impartial in my choice of tyres, I need hardly add the usual disclaimer.

LA 1877.

Fair Treatment.

Sir,—One hears and reads so much nowadays about delay in execution of repairs or despatch of spare parts when a machine has the misfortune to require attention at the hands of the makers that I am prompted to relate my latest experience in this direction for the benefit of the large number of other Rudge riders.

Briefly, the facts are as follows: I purchased a 3½ h.p. multi-speed model from the Rudge depot in Liverpool on September 17th last, and the machine ran with the greatest possible satisfaction until a fortnight ago, when the outer flange of belt rim suddenly refused either to open or to close properly, although correctly coupled to the gate change lever on the left side of the tank. I therefore ran home

Votes for Victor are votes for efficiency.

The efficient motor cycle tyre of to-day must combine qualities of endurance, speed, strength of wall and bead, with—economy.

By any test Victor wins in every department. Victor is the thousand mile better tyre. It presents the motor cyclist with a thousand miles of tyre life free.

Test it once. Victor has revolutionised motor cycle tyre practice.

Test it once. You cannot lose. More miles in a sovereign's worth of Victor than in any other tyre. More satisfaction in every mile of Victor than in any other tyre mile.

Motorcycle Tyre Dept. :

103, St. John Street, Clerkenwell, London, E.C.

on fixed gear without difficulty, and on dismantling the back wheel later, found that the sliding carrier had become jammed on the spindle, causing the movable telescopic sleeve in the hub to remain stationary.

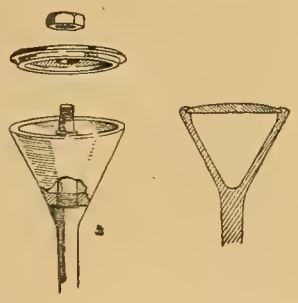
The defective parts were forwarded to the works at Coventry late one Monday evening, and by first post on the following Wednesday a letter was received from Messrs. Rudge-Whitworth, Ltd., that the defects would be remedied and returned same day entirely free of charge, although the usual three months' period of guarantee had expired last December. On enquiry at their Liverpool depot two days later, I found that the defective parts had not merely been returned as advised, but a brand new complete back wheel had been forwarded; which is, I believe, priced in the catalogue at about £4 5s. This was built into the machine in less than five minutes, and all assembled again ready for the road within five working days.

I might also add that I have for some months past been regularly running on about 33% petrol and 66% paraffin for solo riding and, say, 50% of each for sidecar work; and, provided one is content to ride for "pleasure" on slightly retarded ignition at not over 25 m.p.h., this mixture, with a Senspray carburetter, seems to be quite satisfactory in every respect. Benzole and paraffin in approximately the same proportions appear to give similar results, but I cannot speak from sufficiently lengthy experience thereof.

F. J. KELSHAW CONWAY.

A Revolutionary Suggestion.

Sir,—I have read with interest the wordy warfare between "Ixion" and "L.M.M.J." on the subject of trumpet shaped valves. The idea has always appealed to me, and, in 1911, I constructed a modified form of trumpet valve and used it for a considerable distance. I was puzzled for some time by the constant necessity of filing bits off the stem, which appeared to lengthen indefinitely, but I subsequently found this was due to the valve curling up at the edges. It was in use in the inlet pocket, so the presumption is that if it had been used as an exhaust valve the results would have been less satisfactory. Furthermore, the cone was not nearly deep enough, the depth being about 1in. for a valve diameter of 1⅜in. It is quite possible that if a longer cone was used the closing-up effect would be less pronounced. The obvious disadvantages are: (1.) The compression is lowered. (2.) Difficulty of providing means of grinding in. (3.) Increased heating surface. I believe this type of valve would be successful if the top could be closed in with a disc either "spun" in or screwed to an extension of the valve stem (see sketch). The advantages of this type of valve are so obvious that it seems worthy of a thorough trial.



JOHN KENNEDY, Jun.

Carburetter Experiments.

Sir,—Some of your readers may be interested in the following improvements to a 1910 standard Douglas. As I was not satisfied with the original carburetter, I fitted a 1913 Amac, which had to be fixed with the air inlet pointing sideways. After this, misfiring in the back cylinder at slow speeds stopped. During a 750 miles tour in Dorset and South Devon the machine averaged 104 m.p.g. of Shell II. spirit with a 24 jet. I may here mention that the only objection I have to the Amac carburetter is that the jets are not always by any means the size they are stamped, but usually larger, so that my 24 jet was really more like 27 or 28. I noticed that petrol blew back considerably, and finding the inlet valves opened too far I reduced the lift to a bare ⅛in. Though an improvement, it was not a cure, and I therefore lowered the petrol level, and made the jet smaller, so that a strand of Bowden cable would be a loose fit. I then made an extra air pipe 6in. long, which was bent at right angles close to the carburetter so as to point forward on the injector principle. It was slightly funnel shaped, and had coarse gauze over the end, covered by two layers of linen. The air gauze in the carburetter was removed. On a trial run of seventy-three miles on Shell II. I averaged 128 m.p.g., at an average speed of 18-23 m.p.h.

I next tried 90% benzole, and with the same setting of the carburetter as before I now average just 160 m.p.g., which is as good as one can expect. Since using benzole I find the engine starts and runs as easily as with petrol, and a previous frequent knock on steep hills has been cured. I have not taken the engine down since using benzole so cannot say anything about deposit.

A. J. K. DREW.

Tyre Holes under Patches.

Sir,—Responding to "Ixion's" invitation of July 3rd, I am one of those riders who habitually run tyres, etc., to destruction, and experience the difficulty of so affixing the patch as to prevent the puncture splitting. I use one of the best-known patches, together with the special solution recommended, but time after time the puncture has split until it reaches the edge of the patch.

The best remedy I have found as yet is to cut a perfectly circular hole, at each end of the split, with a small punch, such as is used by experimenting chemists for punching holes in corks, but even this is not altogether satisfactory.

I have been recommended to make a cut across each end at right angles to the split, and shall try this next time.

I have always found it easy to remove the old patch with benzoline. In 1,500 miles I have had only one puncture and at least a dozen splits as described above.

H. DARLINGTON.

Automatic Carburetters.

Sir,—I was somewhat taken aback to find in your issue of July 10th a combined pæan of glorification of the automatic carburetter on the part of the writer of your leading article, "Road Rider," and "Ixion," as my own experience has pointed strongly in favour of the non-automatic instrument if power, coupled with flexibility and extreme economy, is desired. Personally, for the last two seasons, I have used the new variable jet B. and B., and the experience has been so satisfactory that it is hard to understand why this model has failed to "catch on," unless it be from mere ignorance of the users. It may be for this reason that the makers have been compelled to alter some of its best features.

This type has all the advantages of the fixed two-jet carburetter, and can do all that an automatic vaporiser can. As regards flexibility I find no difficulty in running from seven to fifty-seven or sixty by speedometer on a fixed gear of 4¼ to 1; for the former speed all that is necessary is to close the jet lever a trifle, and close up the bottom air holes by the sliding shutter provided in the 1912 model. Of course the tiny jet opening thus obtained in conjunction with the absence of bottom air really acts as a pilot jet when the throttle and air pistons are nearly shut; hence extreme flexibility and remarkably easy and gentle starting. In traffic it is quite easy to attain the much-belauded automaticity by setting the adjustments (all done from the saddle) in such a manner that speeds from ten to thirty-five are given by moving the throttle alone; the actual setting depends on what gunnery experts would call the "error of the day."

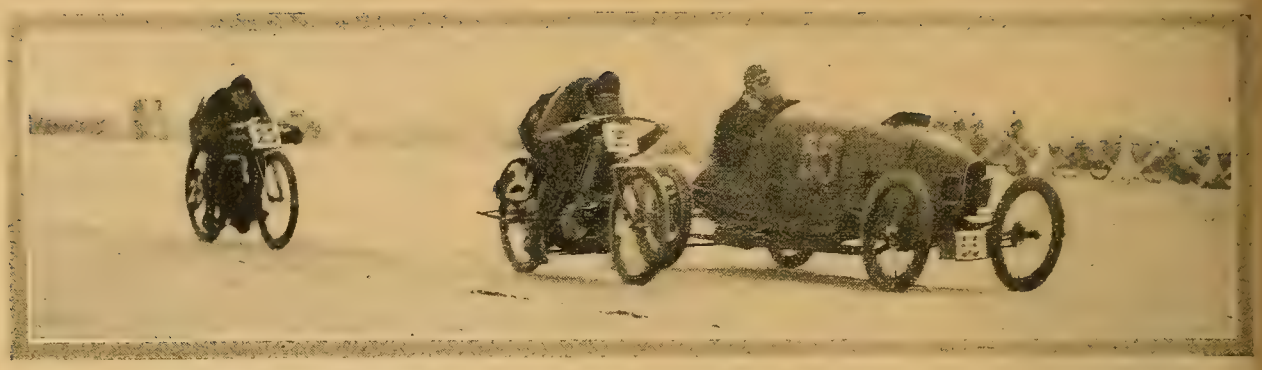
Economy. My own machine (a T.T. James), without any special adjustments, regularly covers 130 to 140 on the gallon on good roads, averaging about 25 m.p.h., and I am convinced that even 160-170 could be done under favourable conditions, provided speed were no object. (Benzole has not been tried yet.) Such results could not possibly be achieved by a fixed jet carburetter unless power were sacrificed; with the universal B. and B. the rider merely moves the jet lever a shade when a hill comes into sight, closing it off as he clears the top. In coasting the jet can be shut right off, thus further saving fuel; and if the exhaust lever be dropped, and the air and throttle levers opened wide, cold air is sucked through the engine, plus a useful braking effect unaccompanied by explosions in the silencer.

The sole defect in the two-lever variable jet type is naturally that it demands more skilled and "sympathetic" handling, but this "defect" adds enormously to the pleasure of driving, especially as all adjustments are affected from the saddle, even at fairly high speeds.

Finally, its simplicity is its great feature: it certainly comes nearest the ideal "hole in a pipe"—which is all a good carburetter need be.

I add the usual disclaimer.

AUTOBORE.



SIX HOURS' RACE AT BROOKLANDS. H. O. Wood (Scott), winner of the T.T. and O. C. Godfrey (Indian), passing A. Francis (Duo).

Belfast v. Dublin.

Sir,—With reference to the letter of Mr. R. G. Lindsay, the president of the Ulster Centre of the Motor Cycle Union of Ireland, regarding the result of the inter-centre contest between the Ulster and Southern Centres, which appeared in your issue of the 10th inst., I would like, in justice to myself, to say that the figures were given to me by the acting hon. secretary of the Southern Centre with permission to publish them. He mentioned they were subject to confirmation by the Ulster Centre of the Union, and this fact was stated in the manuscript sent to you, but owing, I presume, to the exigencies of space, the paragraph was deleted. YOUR CORRESPONDENT.

Is the Three-wheeler a Cycle Car?

Sir,—With reference to the letter in your issue of July 17th from Mr. H. F. S. Morgan, in which he says, "The C.C.C. in its hill-climb excluded them (three-wheeled cycle cars)." If by these initials he intends to refer to the Cyclecar Club, permit me to point out that three-wheelers were not debarred, but that, on the other hand, in two classes gained awards. If, further, he implies that the Morgan cycle car had not an opportunity of demonstrating its superiority over every other type of machine, he has apparently overlooked the special prize for the best figure of merit irrespective of class, which was won by Mr. Parnacott on his three-wheeled Cycar.

A. C. ARMSTRONG,
For the Hon. Secretary, Cyclecar Club.

[Mr. Morgan's letter was not intended to go into details, but apparently he was excluded from Classes III. and V. This is probably what he means. Is the Cycar a three-wheeler as the writer states? We believe not.—ED.]

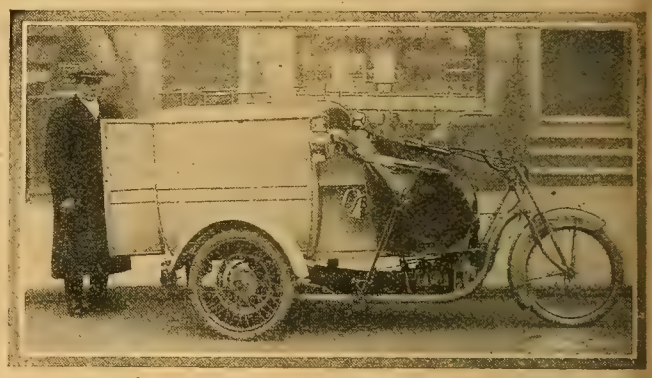
Wear of Big End Bearings.

Sir,—Our friend "Ubique," on page 898, appears to be "flogging a dead horse." There certainly are very few 85 mm. bore engines having big ends of 1in. × 1¼in., the more popular size being ⅞in. (or even a little less diameter) by 1in. wide, but why worry about plain bearings and forced lubrication when a roller bearing gets you out of all this trouble, "killing two birds with one stone," for not only does the roller bearing revolve far more freely than a plain one, but it is absolutely self-lubricating. Every drop of oil which gets in contact with a roller is immediately transferred to the neighbouring rollers, and also to the crank pin and the big end.

It is this automatic lubrication which makes it advisable to fit roller bearings to the small end also, and the rollers seem to behave quite as well with the oscillating movement of the connecting rod at small end as they do with full rotation of the crank pin.

As to the oil reaching the big end, the idea of the connecting rod dipping in a pool of oil has been put to sleep long since, but modern motor cycle engines usually have the feed pipe so arranged that the oil falls between the flywheels immediately on to the connecting rod, which, therefore, gets the first pull at the oil.

One leading firm of engineers who have developed very high revolutions (and consequent horse-power) by experiments against the air brake, which have extended over years, find that the roller bearing connecting rods are absolutely the last thing to give any trouble. They will stand full load without appreciable wear longer than the ball bearings to the main shaft, which is saying a good deal, while the plain bushes have seized up repeatedly with less than one hour's continuous run. MOBIQUE.



The latest model Wall tricarriage with business body. The fact that Wall three-wheelers may be obtained with interchangeable bodies adaptable either for pleasure or business purposes is responsible for a brisk demand.

A double-seated sidecar described by Mr. W. J. Walter.

A Two-seated Sidecar.

Sir,—I am sending you photographs of my double-seated sidecar. It is locally made, being built with three-ply birch and bound with aluminium. The child's seat folds up under the front of car when not in use. This body is quite as light as a good many cane ones.

The machine is an 8 h.p. Bat, 1911, which, combined with the P. and M. gear, is ideal for sidecar work. The sidecar chassis is, I believe, a Chater-Lea. It has five connections, which gives a feeling of safety to the driver.

I shall be pleased to give the name of the maker of this body to any reader who desired it. W. J. WALTER.

The C.A.V.-Ruthardt Magneto
for Motor Cycles.

Totally enclosed.
Waterproof.
Dustproof.
Foolproof.
Minimum weight.
Maximum efficiency.

Another Sweeping Success.

At Colwyn Bay, Stanley on his Singer machine fitted with the C.A.V.-Ruthardt Magneto, secures in one day *five* 1st and one 2nd and Special Cup.

Facts speak for themselves.

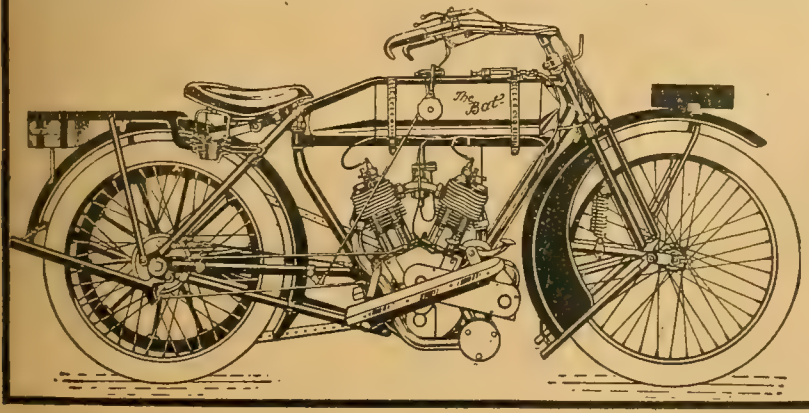
BAT
BEST AFTER TESTS

Both Sides of the Game

Brief Specification of B.A.T.

Model 2 (Light Roadster), J.A.P. Engine 5-6 h.p., low built frame, ball bearing spring forks, Kempshall 26 x 2½ Tyres, foot-operated clutch, Armstrong Mark VI. gear, Bosch high tension magneto, Amac carburetter, handle-bars as illustrated, T.T., a roadster type to order, finished in superior French grey enamel.



Practically every follower of motor cycling, without being essentially a speedman, desires at various times to participate in club competitions and open trials.

The Bat model No. 2 has been specially designed to meet the demand of the all-round rider.

It is a machine which he can use with every confidence in hill-climbing and speed tests, and for sidecar and solo work on the road.

Designed on speedy, graceful lines, a good looking racy mount in every respect.

A postcard will bring you the latest edition of the Book of the Bat, post free.

In answering this advertisement it is desirable to mention "The Motor Cycle."

Carburetters and Flexibility.

Sir,—I was very glad to see your leading article on "Automatic Carburetters," and particularly in reference to the pilot jet, and I am quite sure that the pilot jet is an absolute essential in an automatic carburetter if really slow flexible pulling is to be obtained with great economy. Many carburetters will pull slowly and flexibly, and be automatic, but at the expense of fuel; the tiny pilot jet gives you a very little mixture, but of the right sort.

Regarding your suggestion for a trial for flexibility, speed, and economy, I sincerely trust that this will be arranged. I quite agree with you that there is no reason whatever why a motor bicycle should not be driven like a car with practically the same amount of flexibility without having two levers to fiddle about.

Referring to Mr. Robinson's statement that he can obtain 120 miles to the gallon with my carburetter on benzole, I am quite sure he can do this, as I am constantly hearing from clients who say they get more than this.

The real difficulty in getting automatic two-jet carburetters adopted by the trade largely is the price. They cannot be sold at the same price as an ordinary carburetter, because there is more work in them, and they require much more accurate making. The fitting and grinding in of the throttle of my two-jet automatic carburetters costs more than making the rest of the carburetter, and if the throttle is not a good fit, then the efficiency is impaired, and the petrol consumption increases, and where a manufacturer can sell the whole of his output with carburetters which cost half as much money he is not likely to change. Several manufacturers whom I have called on have told me they quite recognise my claims, but as long as the price was twice as much as they were paying they were not interested.

When the supply of motor cycles is well equal to the demand, and purchasers a little more particular, and insist on certain conditions of flexibility, speed, and economy, then will the manufacturer of the automatic carburetter come into his own. One of the last manufacturers I called on said, "I am making 3,000 motor bicycles during this year. The price you are asking for your carburetters is exactly 15s. more than what I am paying, consequently, I should make an actual loss of £2,250." I suggested that customers would probably be willing to pay the 15s. extra, and he told me in some cases they might, but it would cause disorganisation and all kinds of worries and delays.

No! It is up to the rider to insist on a certain guaranteed performance, and if he sees a carburetter advertised with this he has a right to have it. I do not think it will be long before the manufacturers recognise this, as it is certainly a hardship for a man to pay £50 or £60 for a machine and then immediately to have to buy another carburetter which will give him what he requires. CHARLES BINKS.

Wear of Bearings.

Sir,—A correspondent in your issue of July 17th comments on my article under the above heading appearing in the issue of June 26th.

I should like to say that I was perfectly serious when I stated that common lead made a satisfactory bearing metal and had a low friction coefficient. No technical communication is of any value if it is not to be taken seriously, so that it is rather peculiar that "A.M.I.M.E." should give the article credit for being of interest and yet doubt whether it can be taken as serious.

The point I wished to make was that there was nothing to choose between common lead or any alloy of lead in the form of any of the well-known bearing metals. As "A.M.I.M.E." points out, it is important that the alloy be chosen to give a close homogeneous metal, but beyond this, provided that proper lubrication is maintained, no one alloy can be got to give results materially superior to others.

In Goodman's tests of bearing metals, up to 1,500 r.p.m. and 10 tons load on a 6in. axle, it was found that "ordinary commercial lead gave excellent results under moderate pressure": the friction was lower than that of any other metal tested, and, provided the pressure did not greatly exceed 300 lbs. per square inch, the wear was not excessive.

Of course, the heavy bearing pressures and inadequate lubrication prevailing on almost all motor cycle engines preclude the possibility of using anything but hard metal for the bushes—*with the result that both the pins and the bushes wear*. The adoption of ball and roller bearings does not go to the root of the trouble, and adds further objections. Motor car designers have abandoned them owing to their noisy and harsh running; they show a slight saving in weight and space, and do not require much lubrication, but in these days when the width of engines is not limited by the old conventions, it would be far preferable to have *plain bearings and adequate lubrication*.

It is certainly astonishing, when we consider the progress that has been made in motor car construction, to find the ordinary motor cycle engine as noisy and as crudely lubricated as it was ten years ago. The best place for ball and roller bearings is under conditions of steady load—as in the gear box. A.M.I.C.E.

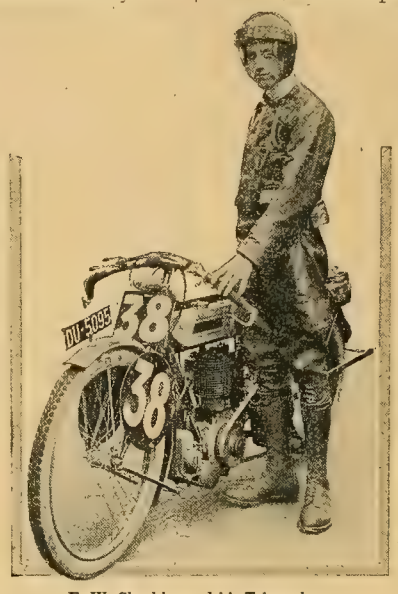
Racing without Spare Parts.

WE had a chat last week with E. W. Cheshire, the Triumph rider, who, it will be remembered, finished second in the motor cycle Grand Prix Race, less than four minutes behind T. E. Greene. The Grand Prix was Cheshire's first road race, and, seeing that the Triumph riders were very much handicapped by not having practised on the course, Cheshire and Clayton can be said to have performed extremely well by finishing second and fourth respectively. The only chance they had of seeing the corners was on push bicycles, and one afternoon the Triumph team (consisting of Cheshire, Clayton, and Newsome) thoroughly enjoyed themselves racing round the track on push-bicycles—but one lap was quite enough! It was a fact well known on the Picardie Circuit that the Triumph riders had no spares whatever; the supply which had been sent over by the firm having been detained in the Customs. This would not have caused the riders so much concern had they not been using a new valve. It says something for the reliability of their engines that no spares were required. Young Clayton had chronic toothache all night before the race, and two hours before the start had his gums lanced; his face was terribly swollen, the poor fellow being in great agony throughout the race.



E. W. Cheshire and his Triumph.

The Triumphs were geared 4 to 1, and Cheshire and Clayton used ordinary Clincher beaded-edge touring tyres 26in. × 2⅜in. The Triumph Co. wisely stipulated that their riders should use security bolts and should wear pneumatic helmets. It will be remembered that we urged the desirability of this becoming an A.C.U. rule in future T.T. Races.

Cheshire had five stops; two for replenishments, another because he imagined he had a puncture, another due to an air lock in the petrol supply, and the last because the compression momentarily disappeared, no doubt due to a particle of carbon under the valve seating. Cheshire considers that a foot-oiler on a racing machine is practically indispensable. He could not, for instance, have left hold of the handle-bars when passing over the uneven road in Boves to oil the engine. He used a Silvertown rubber and canvas belt, which was untouched throughout and was quite taut at the finish. Incidentally, this belt may shortly be fitted to Triumph machines as standard under their own name.

CYCLE CAR CLUB'S OPEN HILL-CLIMB AT SOUTH HARTING.

REVISED OFFICIAL RESULTS.

WE are now able to publish the revised official results of the South Harting Hill-climb, which took place on June 28th. It will be observed that these differ from the original figures—to the inaccuracies in which we at once drew attention—in no less than twenty-three places. The order of merit is altered in two cases, and we offer our sympathy to those who find themselves displaced from positions which they had reason to think they had won. The original Chota figure was as high as 2.096.

* Offered by Hon. Trials Secretary, Mr. A. H. Selwyn, for highest figure of merit.

OPEN HALF-DAY TRIAL.

THIRD OF THE HERTFORDSHIRE M.C.C. SERIES.

SATURDAY last was the date fixed for the third open half-day trial organised by the Hertfordshire M.C.C., but the morning was so wet that at one time the event was in danger of postponement. However, at 1.30, just an hour before the start, the rain cleared off, and competitors began to assemble at the George Hotel, Enfield. Among the earliest arrivals was S. Crawley, the energetic Triumph rider, who had ridden down from Coventry, and was to return by road the same evening. Miss Walker (2½ Hobart) and Miss Mary Ellis, handling a big 8 Matchless and sidecar, formed the ladies' brigade, for Miss Cooke, though entered, was unable to turn up. The entry of thirty-seven was considerably spoiled by the weather, and only about thirty started.

The First Speed Trial.

The route led through Potters Bar and South Mimms to North Mimms, where a speed trial was held over a short stretch of road in a private park. The test was somewhat marred by the loose surface, which made it almost impossible for the faster machines to keep on the road, and D. W. Perry (Rudge) and C. C. Cooke (Triumph), who were very fast in the early stretches, both fell. Miss Mary Ellis made a fine performance, and Miss Walker, H. W. Vernon (3½ twin Matchless), F. Abbiss (3½ Triumph), S. Hall (6 Rex), A. H. Wright (6 A.J.S. sc.), S. Crawley, (Triumph), and F. A. McNab (5 Trump) were all going well, Crawley and McNab seeming to be the fastest pair. A. H. Wright nearly left the road while at speed. Bedford (5 Hazlewood) was very quiet. The little Wilton cycle car, driven by C. F. Halsall, arrived very late at the start, but was running splendidly. Shortly after the start it picked up a stranded motor cyclist, and continued with three up. The course led through Hatfield and Welwyn to Hitchin, where competitors checked in at the post office, thence *viâ* Lilley, Hesiton and Barton to Sundon.

Loose Surface.

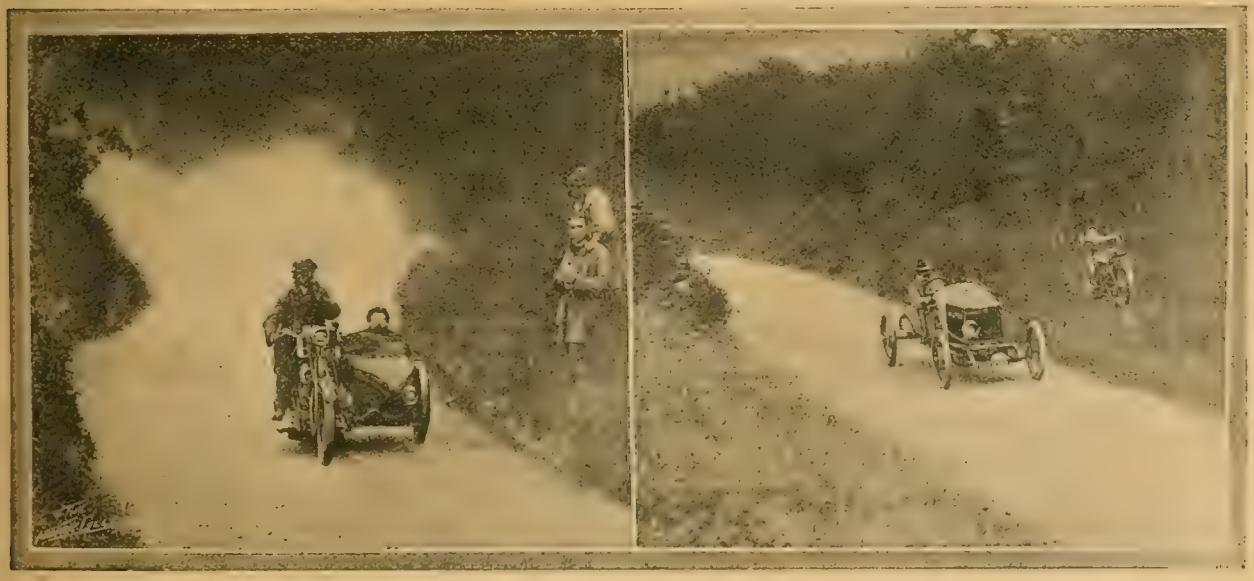
The roads in places were treacherous. The surface of Sundon Hill was too bad to allow of many fast ascents, but there were few failures. The road from Sundon to Dunstable is uninteresting, but shortly after the last-mentioned town Crawley took a wrong road.

The Tring Road was followed over the Ivinghoe Downs, but avoiding Tring Town. Competitors were led into the Aylesbury Road, and thence to Aston Clinton Hill. This hill is too well-known and too easy to cause much trouble, and A. E. Walker was the only rider who had to dismount. G. Berry (3½ Precision) had a slipping belt owing to his pulley flange unscrewing, but got up by using his foot as a jockey pulley. As this was not a timed hill there were no really fast climbs. D. W. Perry, C. C. Cooke, H. W. Vernon, S. Hall, and F. A. McNab all came up very well. A. H. Wright was driving his A.J.S. and sidecar sitting side saddle, being apparently tired of the more usual position. The first arrival at the hill was E. C. Jarvis (3½ Singer), who made a good ascent, but seemed to be in a hurry, for he was some way ahead of the rest. Narrow, twisty lanes followed, leading through St. Leonards and Bellingden to Chesham, where a fifteen minutes' stop was allowed for tea. Now came a short section, which was rather sparsely arrowed, leading to a little known hill near Chesham Bois.

Miss May Walker (2½ h.p. Hobart) negotiating the sharp bend on Sundon Hill. Miss Walker obtained second place in Class A.

A Tricky Hill.

Fortunately, most of the competitors knew their way, and all the survivors safely reached the rather tricky little hill. A right-hand bend brings one on to the steepest part of the



CLIMBING SUNDON HILL IN THE HERTFORDSHIRE M.C.C. OPEN TRIAL.

A. R. Hare (6 h.p. Enfield sidecar) passing the timekeeper. C. F. Halsall (8-10 h.p. Wilton cycle car) on the same hill.

Open Half-day Trial.—

hill, the surface of which was rather greasy. However, all those who reached the hill made clean ascents except T. Smith and G. Berry, whose belt failed him. F. Abbiss (3½ Triumph) is reported to have failed near the bottom, but we saw him finish in good form, apparently after a restart. Good climbs were made by Miss Mary Ellis, C. C. Cooke, H. W. Vernon, S. Hall, A. H. Wright, A. R. Hare (6 Enfield sc.), H. Haines (3½ Premier) sc.), S. Halsall (2¾ Veloce), C. F. Halsall (Wilton cycle car), and Bedford (5 Hazlewood). The route continued through Amersham, Rickmansworth, Croxley Green, Watford, to St Albans, by Holywell Hill, which, though a favourite local test, is not steep enough to worry a machine in good trim.

The Second Speed Test.

The London Road was followed to Bell Lane, where a left-hand turn leads to North Mimms and the second speed test. The surface in this test is much better and some good speeds were made, the most conspicuous performances being those of D. W. Perry, R. T. and H. W. Vernon, S. Halsall and C. F. Halsall, G. Berry and Miss Mary Ellis. Thence through the park till the main road is reached and on to Barnet there is little of interest to record.

C. C. Cooke, being the secretary of the event, is unable to take the prize in Class B; it therefore goes to D. W. Perry. Both the winners in the passenger class made meritorious performances. The following made non-stop runs:

R. T. Vernon (6 Matchless)
C. F. Halsall (10 Wilton cycle car)
S. Halsall (2½ Veloce)
F. Wolfe (3½ Rudge Multi)
E. C. Jarvis (3½ Singer)
H. Haines (3½ Premier sc.)
A. H. Wright (6 A.J.S. sc.)
Arthur Ellis (3½ Rudge)
Miss Walker (2½ Hobart)
S. F. Nickolds (3½ Kerry-Abingdon)
W. H. Bedford (5 Hazlewood)

Final results:

CLASS A. Up to 350 c.c.

Rider and machine.	Non-stop 30.	Non-stop 40.	Speed test 30.	Hill-climb Position.	Total
S. Halsall (2½ Veloce) ...	30	39	30	1	99
Miss Walker (2½ Hobart) ...	30	36	24	2	90

CLASS B. Between 350 and 517 c.c.

Results of Irish End-to-End Run.

Group of competitors in the annual Irish End-to-End Run for the Palmer trophy. (See page 939 last week).

The results of the End-to-end of Ireland Reliability Trial, under the auspices of the Ulster Centre of the Motor Cycle Union of Ireland, have been announced as under.

The scores given below represent the net figures after deducting marks where such penalty was imposed in consequence of the ascent of either hill not being clean at the first attempt:

1. L. Newey, Birmingham (3½ Ariel), open controls, 120 marks; secret controls, 220 seconds variation.
2. J. Thompson, Belfast (3½ B.S.A.), open, 120 marks; secret variation, 240 seconds.
3. H. Gibson, Southport (3½ Bradbury sc.), open, 120 marks; secret variation, 330 seconds.
4. T. De la Hay, Stourbridge (2¾ Sunbeam), open, 118 marks.
5. W. J. Chambers, Belfast (3½ B.S.A.), open, 115 marks; secret variation, 5 seconds.
6. James Stewart, Belfast (2¾ Douglas), open, 115 marks; secret variation, 7 seconds.
7. D. H. Noble, Coventry (3½ Rover), open, 115 marks; secret variation, 230 seconds.
8. T. Woods, Dublin (3½ P. and M.), open, 115 marks; secret variation, 235 seconds.

The following are also entitled to silver medals: C. E. Murphy, F. C. Wasley, R. S. Russell, J. A. McCann, R. Fenn, J. Brown, J. Lavery, D. Lucy, V. J. Farrell, C. Martin, W. O. Callaghan, T. Mallon, B. M'Manus, and F. L. Dooley.

The Palmer Tyre trophy goes to L. Newey, the Motor Traders' prize to J. R. Thompson, the four guinea prize and special prize to Hugh Gibson, the two guinea prize to T. De la Hay, and the one guinea prize to W. J. Chambers.

The team prize goes to the Sunbeam team—Messrs. De la Hay, Mallon, and M'Manus—whose point total exceeded any of the other teams finishing.

HOLIDAY HILL-CLIMBING TRIAL.

The Motor Cycling Club will hold a standard reliability and hill-climbing trial, open to all types of standard touring bicycles, sidecar machines, and cycle cars, on August 2nd and 4th. The start will be at 8.30 a.m. Route—Outwards: Newbury, Marlborough, Radstock, Wells, Bridgwater, Minehead, Porlock, Lynton, Barbrook Mill, Watersmeet, and Lynmouth, 135 miles (approx.), Homewards: Lynmouth, Porlock, and route as above, but in the reverse direction, 129 miles (approx.).

For the purpose of the hill-climb machines will be divided into three classes, with certain set minimum speeds.

Scottish Six Days Reliability Trials

Perth, Sunday.

WE are writing on the eve of the Scottish Six Days' Trials, which promise to be by far the greatest success of any of the series. The entries constitute a record in point of numbers, over one hundred being on the spot, and among them are three ladies. Opinions seem divided as to whether they will get through, but everyone admires their sporting spirit in making the effort to do so. Mrs. Mabel Hardee will ride a 3½ P. and M., Miss Reid a 3½ Brough, and Miss R. Hammett will again try her luck in a long distance trial on her 2¾ Douglas. Everyone hopes she will get better fortune with tyres than she had last year.

Perth was absolutely congested on Saturday night when we arrived, and the presence of so many motor cyclists seemed of great interest to the populace. Not only was hotel accommodation at a premium, but it was rather like solving a jig-saw puzzle to get our machine into a garage. However, the proprietor of the Royal George Hotel, directly he knew we were connected with *The Motor Cycle*, set to work and cleared a space in the packed hotel garage for our machine, and turned the billiard room into a bedroom.

A Strenuous Trial.

We were met almost the moment we arrived by Geo. Brough, anxious to have our seals fixed to his machine, for he purposes to ride a further twenty miles at the conclusion of the trials under our observation, so as to complete 1,000 miles in all on his single-geared 6 h.p. Brough without using a tool. He is very cheery and will not hear of defeat, and is quite confident that he can repeat last year's successful journey.

Rex Mundy, who was entered to drive a Morgan, changed his mind at the last moment, and is riding an 8 h.p. Williamson, air-cooled, as a solo mount. A good many critics aver he will find such a large and heavy mount very difficult to manage on some of the twisty mountain roads, but the maker of the machine is confident that this motor cycle, heavy as it is, is quite a manageable solo mount.

Roads and the Weather.

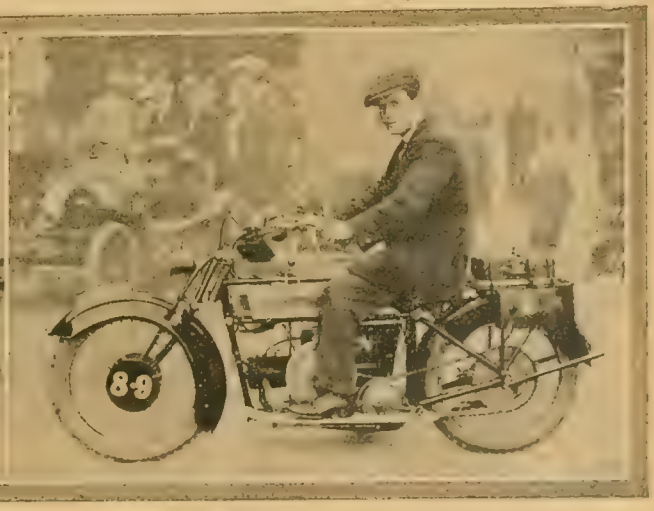
Conflicting reports as to the state of the roads reach us—some saying that they are bad, others that they are good, especially in the extreme North. Anyway, there has been practically no rain in this part of Britain for nearly a month, and at the moment of writing the weather is glorious, but as barometric conditions in the Highlands vary with startling rapidity, we must not bargain on too sunny a trip. A large number of competitors who arrived early spent Saturday in trying out their machines on Amulree, twenty miles from the start, and, as far as we can hear, everyone got up, but several attempts were necessary in some cases. Generally speaking, the lighter machines seem to have acquitted themselves to the most advantage in this informal trial, owing to their handiness at the corners. Our photographer made two clean and easy ascents on his Douglas, so we may take it that if there are any failures to-morrow at this spot they will be due to bad driving. We assume that all machines entered are fit, so the motors should not be blamed if they do not succeed.

We are informed that one of the side-car combinations contain a young couple on their honeymoon!

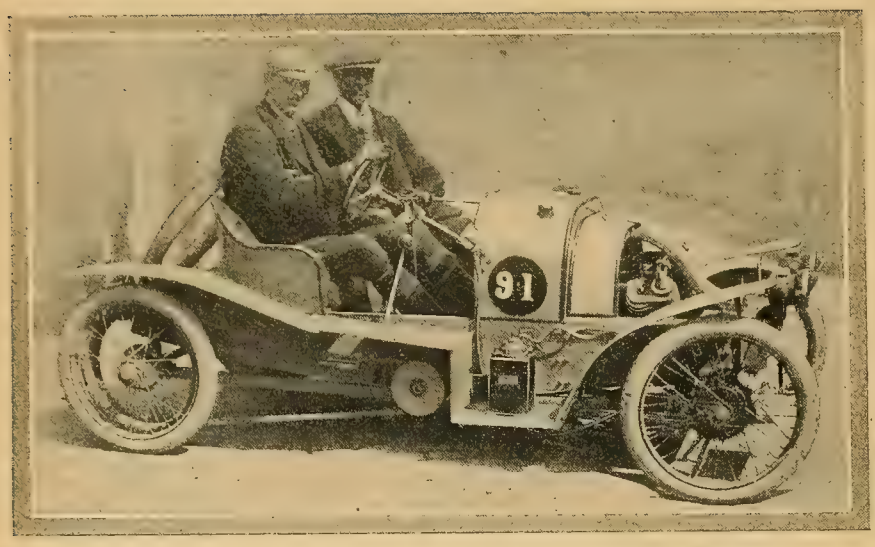
A good number of machines new to six days' events are making their *début* in this competition, and the Armstrong and Summers and Harding cycle cars are also new-comers.

The Edmund, Williamson, Sunbeam, Enfield, Sun-Villiers, and Lea-Francis are notable new-comers to this class of work. Special gear ratios of 6 to 1 and 12 to 1 are fitted to the Lea-Francis machines, and the one ridden by G. I. Francis, No. 35, is fitted with an interesting new carburetter—the Everest. This is an automatic one-lever carburetter, and is a miniature replica of the carburetter fitted to the Maudslay cars. It has seven jets, and great economy in fuel consumption is claimed for it. It is stated that a six-cylinder car, 90×130 mm., has been driven at 30 m.p.h. on a consumption of sixteen miles to the gallon with a heavy body and four passengers, and the results, when the instrument is transferred to a motor cycle, are said to be equally satisfactory. A very neat little lever is fitted at the top of the carburetter at the point where the Bowden wire control enters to vary the amount of air; but this is not moved in running, and is only used to get the correct setting for any violent atmospheric change. A curious point about the 3¼ h.p. Lea-Francis machines is, so we are informed by Francis, that they are actually faster on the average when fitted with the lower ratios of gearing than with the standard 5 to 1 top. It is evident that the J.A.P. engines, with which they are fitted, are designed for a high number of r.p.m. They are very workmanlike machines, and each carries a spare cover fixed very neatly to the side of the machine, a block of wood curved to fit the inside curve of the cover being fitted on the side of the carrier and the cover secured over it and then strapped tightly to the back stays.

"The Motor Cycle" representative sealing the 6 h.p. single geared Brough which George Brough is endeavouring to ride 1,000 miles without making any adjustment.



An 8 h.p. air-cooled Williamson which is being ridden by Rex G. Mundy.



The air-cooled Summers and Harding Cycle car which is being driven by P. D. Walker.

The Sealing.

At eleven o'clock on Sunday the competitors presented themselves at the garage of Messrs. Fergusson. The garage, spacious as it is, was absolutely congested, and the proceedings of checking the spaces, sealing, etc., were strung out to an interminable degree. This was partly due to the way in which entirely unauthorised persons were allowed to roam about the garage at their own sweet will, and half the juvenile population of Perth seemed to be treating themselves to a miniature Olympia Show, with the result that it was a matter of acrobatic agility to find one's way between the closely packed machines. Our first duty was to seal up Geo. Brough's machine on behalf of *The Motor Cycle*, and this was done very thoroughly, even the tool-bag being sealed. Brough came in for a lot of chaff from other riders while his machine was in our hands, and a wag caused much amusement by asking us to seal the rider's feet to the footrests! A threat to go on in advance and seal the doors of the bars at the luncheon and night stops was the only thing to cause Brough consternation, for, in the event of any hill being too much for his single gear of 4 to 1, he imagined the thirst he would develop would cause such seals to be rudely broken!

Mr. Victor Holroyd put in an unexpected visit, and explained that he had started on a holiday trip to Norway, but was unable to get there as the ship on which he had booked his berth had been wrecked, so he decided that a 'busman's holiday was evidently destined for him by fate, so here he is on a 750 c.c. Rudge and sidecar, and he will accompany the riders round part of the course.

A Few Details.

The majority of the machines were workmanlike looking productions, and departures from standard were conspicuous by their absence, but C. R. Collier's sidecar combination was fitted with a new type of gear box giving three speeds. The drive from the engine to the gear box is by enclosed Renold silent chain and thence to the rear wheel, which is shod with a 3in. Palmer, by ¾in. pitch roller chain. Attached to the gear box is a massive kick starter on the Douglas principle, but Collier explained to us that the adoption of this gear will not be decided upon for 1914 until after the trials, and that it is now undergoing its first severe public test.

A great many riders have attached "wire cooling" devices to their cylinder heads, and this idea may be a good one, but it looks ugly.

T. Knowles's T.T. 2¾ Humber attracted a great deal of attention, and it was enamelled bright red with spick and span black and gold lining, and plated silencer. We should imagine that he will find dropped handle-bars rather fatiguing, especially on long descents.

W. Pratt, who always has some 'cute ideas on his P. and M., has fitted large mesh chain nail catchers on his tyres, as has also Mrs. Hardee, and Pratt hopes that his proverbial good luck with tyres will be his lot again this year.

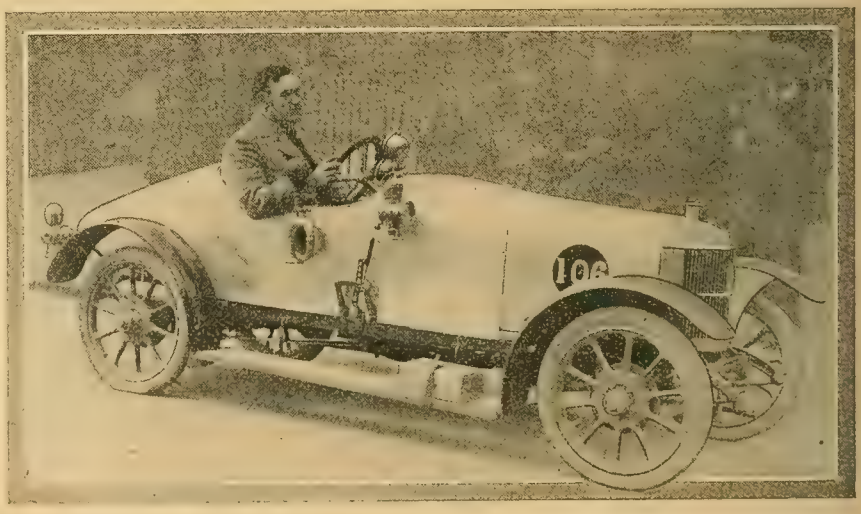
A neat little machine, making its first essay in a big trial, is the 2½ Connaught two stroke. It is fitted with a G.H. two-speed gear and very heavy driving chains, and a perfect bunch of wire round the cylinder head for extra cooling effect. We were rather taken with the rear springing of the Edmund, ridden by a private rider, R. G. MacGibbon. Some of the competitors were very sparsely supplied with spares, and although it is well on a trial of this description to ride as light as possible, we fear some of these men will have cause to rue their optimism before many days are over.

The Cycle Cars.

Taken altogether, the cycle cars did not attract a vast deal of attention, but the Singer is practically a racing model with a fish-tail body and pointed radiator.

A curious looking four-wheeler is the Summers and Harding cycle car. It is fitted with a 90° J.A.P. engine and fixed Eisemann ignition, and, sloping from the dashboard to the front of the car, is a broad wooden board, giving it the appearance something like a Renault. On the board is painted a big Golly-wog. The change-speed lever is mounted by the steering column very much in the manner of the early De Dion quads, and the drive is by shaft from the engine to the three-speed sliding type gear box, and thence to the back wheels by belts. All four wheels are sprung on vertical coiled springs. P. D. Walker, the driver, assured us that it was very fast and would climb anything.

Everyone is hoping for a continuation of the present fine weather, as to-morrow's run is a severe one, a start being made at 8 a.m., the lunch stop being fixed at Braemar, where we are due at 12.41. A certain amount of grumbling has been caused by several of the sidecars being started early in the list, as it is feared that some of them may fail on Amulree and block the narrow road, but we believe that these fears will prove groundless, in the great majority of cases at all events. Fifteen minutes each morning are allowed for work on machines.



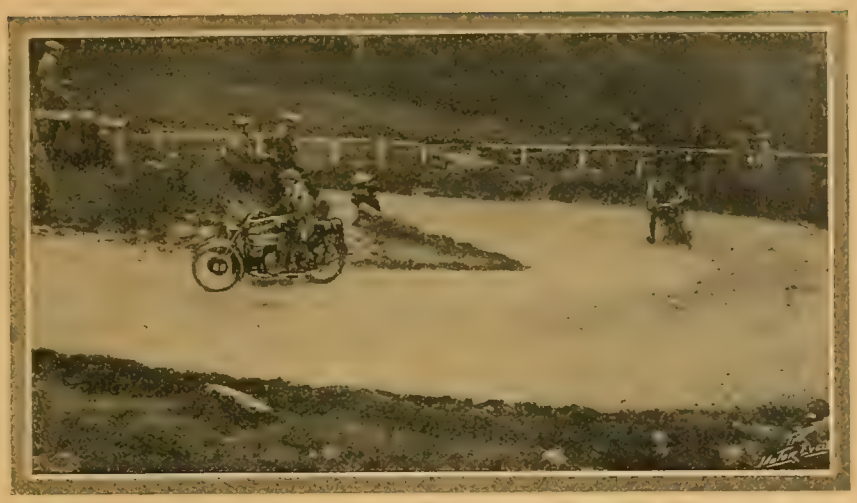
The Singer cycle car driven by L. Martin. As may be seen it is fitted with a new type of fish-tailed body and special wedge-shaped radiator.

FIRST DAY.—Perth, Amulree, Glenquaich, Kenmore, Aberfeldy Ballinluig, Pitlochry, Kirkmichael, Spital of Glenshee, Braemar, Cockbridge, Tomintoul, Grantown, Carr Bridge, Inverness. 173 miles.

The start of the Trial was made in lovely weather on Monday, the first competitor being despatched at 8 a.m. The non-starters included G. E. Cuffe (Premier), C D. Wright (Humber), F. G. Boddington (Morgan), A. D. Scott (Triumph), E. M. Oliver (Hazlewood), Miss Reid (Brough), and T. Silver (Quadrant). Oliver was prevented from starting owing to illness. There was a great crowd at the start, and the ladies in particular came in for much cheering as they were given the word "Go" at the commencement of their long and strenuous trip.

Amulree the First Test.

The first real test was the notorious Amulree with its S bend. Observations thereon were as under: Following good—Thomson (Bat sc.), Morrison (Bat), Downie (A.J.S. sc.); Fletcher (Douglas), Tessier (Bat), and Gibson (Bradbury) splendid; Pratt (P. and M.) failed; Keiller and Wilberforce (G.W.K.'s), both excellent; Wood (G.W.K.), good; Mrs. Baxter (Rex), failed at the second bend. Chisholm (Ariel), failed. Beveridge (Rudge) took the ditch, but recovered finely; Wade (New Imperial sc.), Warren (Premier), and Hands (Williamson sc.), good; Proctor, poor; Chater-Lea, good. J. R. Blackburn (Morgan) punctured a front tyre near Aberfeldy, but soon repaired it. Cramb (Elswick) broke his pulley in avoiding another competitor, and was obliged to retire.



Rex Mundy (8 h.p. Williamson) and an Ariel rider rounding the Devil's Eltow.

The ascent of the Devil's Elbow on the Spital of Glenshee provided a number of sensations. Our observations on the Elbow were as follows: Heath, good; S. Wright (Humberette), very good. Chisholm (Ariel) ran into the gutter and fell heavily without injury. Begg (Rudge) came a cropper at the same spot; but Colliver, on the 7 Indian, made a beautiful ascent. The Rover and Lea-Francis teams to a man were excellent, as also Berwick (3½ Humber) and Beveridge (Rudge). Brough, on his single geared 6 h.p. Brough, climbed the hill with ridiculous ease, but the P. and M. team were not happy, though Mrs.

LIST OF STARTERS WITH OFFICIAL NUMBERS AND DETAILS OF COMPETING MACHINES.

AMULREE, THE FIRST TEST HILL.

(1) At the second bend. A. W. Walden (8 h.p. Premier sidecar) and H. W. Hands (Williamson sidecar).

(2) C. T. Newsome (5½ h.p. Rover).

(3) S. J. K. Thomson (7-8 h.p. Bat sidecar) rounding the first acute bend, his passenger on the carrier.

Hardee did well. Miss Hammett (Douglas) fell, luckily without serious damage. The Villiers machines made beautiful climbs. Mrs. Baxter (Rex) was loudly cheered as she managed her heavy twin magnificently. Hoult (Matchless) made an extraordinary recovery. He charged the bank, climbed up 1 in 2, slid down backwards, and went on without dismounting. Naturally, he was loudly cheered for his exhibition. The best performance among the sidecarists was easily that of Hands, whose passenger came up smoking comfortably in quite his normal position in contradistinction to the other sidecar passengers, who mostly performed acrobatic feats over the carriers.

Charles R. Collier (Matchless sc.) was very good, Guest (Matchless) fast, and Cocks (Connaught) made a fine climb. Pollock (James sc.) was good, with passenger leaning well over. Several competitors assisted at the bend by foot slogging, and thereby managed to get round.

The surface of the road was appalling, being inches deep in loose sand and big stones, whilst the descent from the Devil's Elbow to Braemar may be described as the worst road in Britain. Southerners can have no idea of the roughness. On one occasion competitors had to push for half a mile over huge unrolled granite

Great interest was evinced in the trial all along the route, even labourers carrying programmes.

The sensation of the day was the burning, by the Devil's Elbow, of Victor Wilberforce's G.W.K. How the fire originated is a mystery, but the petrol tank burst, and instantly the whole machine burst into flames, and was soon a total wreck. Luckily the driver and passenger jumped clear. Gulland (B.S.A.) had to retire at Braemar. His back tyre was wrenched off in climbing Amulree, and a bad fall gashed his head. A doctor refused to allow him to proceed.

After lunch, at Braemar, the roads improved awhile, but at the end of six miles the competitors were suddenly directed off the main Aberdeen Road on to a succession of precipitous ups and downs across the hills towards Cockbridge. Arriving there, we were faced with a terrific climb for several miles over a frightful surface, loose boulders on 1 in 6 gradients being quite usual features of the road. Generally speaking, there were not many failures through inability to climb, but tyre troubles were prevalent. Before reaching Cockbridge the silencer on Thompson's Kynoch hit a projecting rock, and was smashed, causing him to retire, as the machine made a terrible noise. All the ladies made clean ascents of Cockbridge Ladder. The descent to Grantown was the worst piece of the journey. There were deep gulleys every hundred yards, and a great strain was imposed on front forks and brakes. A false move on the part of the rider would have been fatal, as on the left there was a deep precipice, and the road was very narrow and winding. A large number of competitors were missing at Inverness, but up to a late hour no official list of catastrophes was published. It was reported that Taylor (Rudge) had had a bad smash on Amulree. One report says that a car ran into him, another that a stone lodged in his multi gear and threw him heavily. Cocker also had an accident to his Singer, and was brought into Inverness in the official car. The Humberette made splendid performances on all hills. It is now said that the fire on Wilberforce's G.W.K. was caused through using rubber petrol pipes, which came adrift.

Everyone was glad to see Inverness and all agree that it has been an exceptionally heavy day, especially for passenger machines. The Matchless sidecars ran beautifully, the J.A.P. engines being in perfect tune. Brough continued to play with hills, his performance being remarkable, especially on Cockbridge. The following have retired: Keiller (Rudge), Wilberforce (G.W.K.), Stallebrass (N.S.U.), Cramb (Elswick), Bell (A.J.S.), Gulland (B.S.A.), Dixon (Singer), and Martin (Singer c.c.). Also nine men have lost marks.

Friday's and Saturday's Routes.

FIFTH DAY. — Strathpeffer, Beauly, Drumnadrochit, Invermorriston, Cluanie Sheil Inn, Glenelg, Cluanie, Tomdoun, Fort Augustus Craggie Inn, Carr Bridge, Grantown—199 miles.

SIXTH DAY.—Grantown, Cockbridge, Braemar, Spital of Glenshee, Kirkmichael, Pitlochry, Ballinluig, Aberfeldy, Kenmore, Glenquoich, Crieff, Stirling, Falkirk, Edinburgh—184 miles.

TIME TO LIGHT LAMPS.

July 24th	... ...	8.59 p.m.
,, 26th	... ...	8.56 ,,
,, 28th	.. ...	8.53 ,,
,, 30th	... ...	8.50 ,,

English-Dutch Trial.

Additional subscriptions to the fund in connection with the Dutch motor cyclists' visit next month are :

	£	s.	d.
Glyn Rowden		10	6
J. W. G. Brooker ...		10	6
R. R. Fletcher ...		10	6

A Severe Trial.

Fourteen test hills, each having single figure gradients, have been crammed into a one-day reliability trial of the Coventry and Warwickshire Motor Club to be held on Saturday. The course includes the gradients embodied in the open reliability trial in May with several additions, and the chief award is the Manville trophy, valued at forty guineas.

Perry's Private Testing Track.

The makers of the Perry light car are constructing a private testing track at their works at Tyseley, near Birmingham. The track when completed will be about half a mile in circumference, but it is not circular. Last week we inspected the test hill, which is a short ascent and descent of 1 in 5, and saw a Perry car driven over it from a standing start on the second gear; descending the hill and returning over the rough uncompleted track, the little car went over the hill on top gear. All cars, which are now being delivered in regular numbers, have to stop on the 1 in 5 hill and restart on second speed before being passed.

Arbitrary Speed Limits.

We are glad to learn, on the authority of the *Daily Mail*, that the practice of trapping motorists on the open road is to be discouraged by the order of the Home Secretary, Mr. R. McKenna. Speed traps will be set at places only where speed is really dangerous, and at the same time all reckless drivers will be rigorously dealt with. This is as it should be. We have always been of the opinion that an arbitrary speed limit was quite unnecessary, provided that the police used unsparingly, but with due consideration and fairness, the powers they already had for the suppression of dangerous driving of all sorts—not of motors only, for these are not the only offenders. We may say that we entirely agree with the *Daily Mail*, which puts the case very fairly and adequately. Unfortunately the Home Office deny all knowledge of the matter.

A Cycle Car Challenge.

We understand that Violet, the driver of the Violet-Bogey, has issued a challenge against Bourbeau, who came in first in his class in the Grand Prix. He declares himself ready to compete against Bourbeau on the track or on the road, under such conditions as Bourbeau shall fix. The race will be run in two heats, so as to eliminate the element of luck as far as possible.

Bank Holiday Run in Hampshire.

A reliability trial open to Hampshire clubs will take place on the August Bank Holiday. The start will be from the New Inn, Drayton. The luncheon stop will be at Midhurst, where competitors must hand over their machines to the official in charge, and no adjustments will be allowed. There will be two non-stop sections and three observed hills. The machines will be divided into three classes : I., solo machines, any capacity; II., sidecars under 560 c.c.; III., sidecars over 560 c.c. and cycle cars. Entries will be received up to the 26th inst.

A.C.U. Notes.

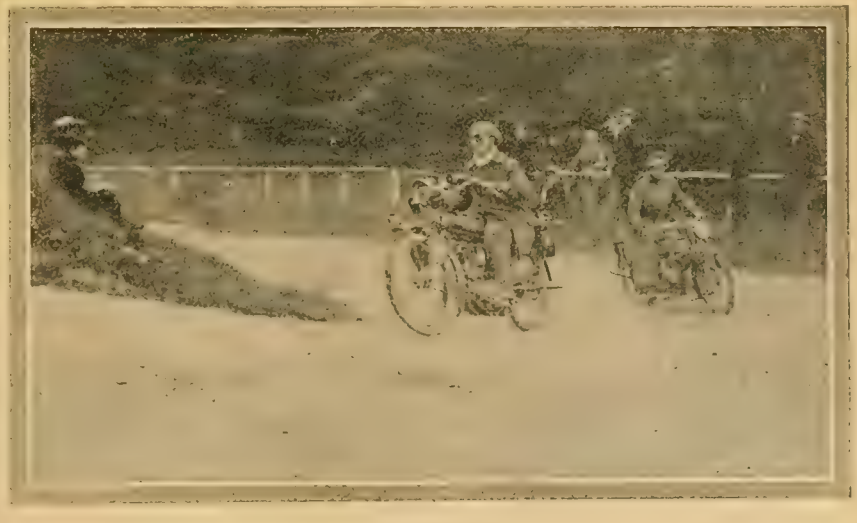
MEMBERSHIP.—The membership of the Auto Cycle Union continues to increase in the most satisfactory manner. During the last four weeks no less than 452 new members were elected.

THE CONFERENCE OF ROAD USERS.—At this conference, at which the Royal Automobile Club and the Auto Cycle Union were represented, the following are a few of the proposals put forward by the R.A.C., which, if they should be ultimately adopted, will prove of inestimable benefit to automobilists and motor cyclists alike : That side roads should be signposted at points just before they join main roads; that the camber of roads should be restricted; that horns and hooters should be the warning signs used on all mechanically-propelled vehicles, and bells should be confined to pedal cycles; that sheep or cattle driven along the highway after dark should be accompanied by a man carrying a light visible in all directions.

A.C.U. CONTRIBUTIONS TO THE ROYAL AUTOMOBILE AND ASSOCIATED CLUBS.—The Auto Cycle Union has decided to give the following donations to the R.A.C. and associated clubs : £150 to the legal department; £100 to the road guides; and £100 to the touring department. It is especially gratifying to note that the A.C.U. is now able to pay its fair share towards the support of those branches of the R.A.C. which confer such valuable benefits on motor cyclists.

SPECIAL FEATURES:

SCOTTISH SIX DAYS' TRIALS.
THE START.
THREE NEW CYCLE CARS.
SIX HOURS' RACE AT BROOKLANDS.



THE SCOTTISH SIX DAYS' TRIALS.
J. R. Alexander (7 h.p. Indian) and Mrs. Hardee (P. and M.) on the Devil's Elbow.

A Sidecar up the Nailsworth Ladder.

A telegram announces that at the beginning of this week, W. H. Carson, of Coventry, driving a 5-6 h.p. Excelsior sidecar, succeeded in climbing the Nailsworth Ladder, the low gear ratio being 13 to 1.

Result of Spanish Road Race.

The Bilbao-San Sebastian-Bilbao Road Race, on Sunday last, was supported by a number of English entrants. The hilly and winding course caused great trouble to the competitors, and falls were frequent. Nevertheless, British victories were again recorded, the result being that in the 350 c.c. class Douglas machines scored a decisive victory, being first, second, and third. In the 500 c.c. class the result was: 1, F. A. Applebee (Scott); 2, Torriegulta (Triumph); 3, T. E. Greene (Rudge).

New Petrol Substitute.

The Petrol Substitutes Joint Committee, which is composed of representatives from the Royal Automobile Club, the Society of Motor Manufacturers and Traders, and the Automobile Association and Motor Union, has lately visited the Frankett works at Acton, and inspected a special plant for the treatment of peat under a process invented and patented by Herr Franke, one of the chief by-products being motor spirit. The members of the Committee had a short run in a F.I.A.T. car driven on the motor spirit thus produced.

La Coupe Internationale.

On the 4th and 5th of August La Coupe Internationale des Motocyclettes et Motorcycles will be competed for over the Circuit du Mans. The course measures 324 kilometres for motor cycles, and 270 kilometres for sidecars and cycle cars. There is already an entry of fourteen well-known French motor cyclists and eight cycle car drivers; the latter include nearly all those who did well in the recent Grand Prix. While at Amiens, many English riders promised their entries, and we have been asked to solicit entries from others. The arrangements, we hear, are excellent, and 1,200 soldiers will be employed to guard the course.

FUTURE EVENTS.

Aug.	2-3.	International Cup Race in France.
"	2.	Hertfordshire M.C.C. Open Half-Day Trial.
"	2-4.	M.C.C. Devon Trial.

"	30.	Streatham and District M.C.C. Annual Open Hill Climb.
"	30.	Hertfordshire M.C.C. Open Half-Day Trial.
Sept.	6.	Coventry and Warwickshire M.C. Annual Open Hill Climb.
"	13.	B.M.C.R.C. Race Meeting.

Speed Test in the Six Days' Trial.

The venue of the speed trials in connection with the A.C.U. Six Days' Trials next month has been altered. It was found impossible to secure Lowther Park for the day desired, and it has now been arranged to hold them at Underley Hall, Kirkby-Lonsdale, where there is a good mile stretch of private road available.

A.A. and M.U. and Cycle Cars.

At the annual general meeting of the A.A. and M.U., which was held on the 14th, at the Hotel Cecil, London, Mr. Chas. Jarrott, who occupied the chair, in the absence through illness of the chairman, Mr. W. Joynson-Hicks, M.P., announced that 22,000 motorists had joined the Association during the past year, and that the total membership was now 65,000. A matter of special interest dealt with was the cycle car movement, and the Chairman announced that a cycle car committee is in course of formation to deal with matters particularly affecting this branch of motoring, and nominations for this committee are being invited from those particularly interested in the cycle car movement.

The Grand Prix.

Several readers have called our attention to the fact that two well-known makers of lubricating oil are claiming that their particular oil was used by T. E. Greene on his Rudge when he won the Grand Prix. Our information obtained on the spot was to the effect that Price's oil was used.

Road Race in Italy.

Last week there was run a motor cycle race, called the Circuito Umbro, over a distance of 350 km., over a very mountainous course in Central Italy, organised by the Moto Club Terni. The entries were numerous, and the results are given hereunder:

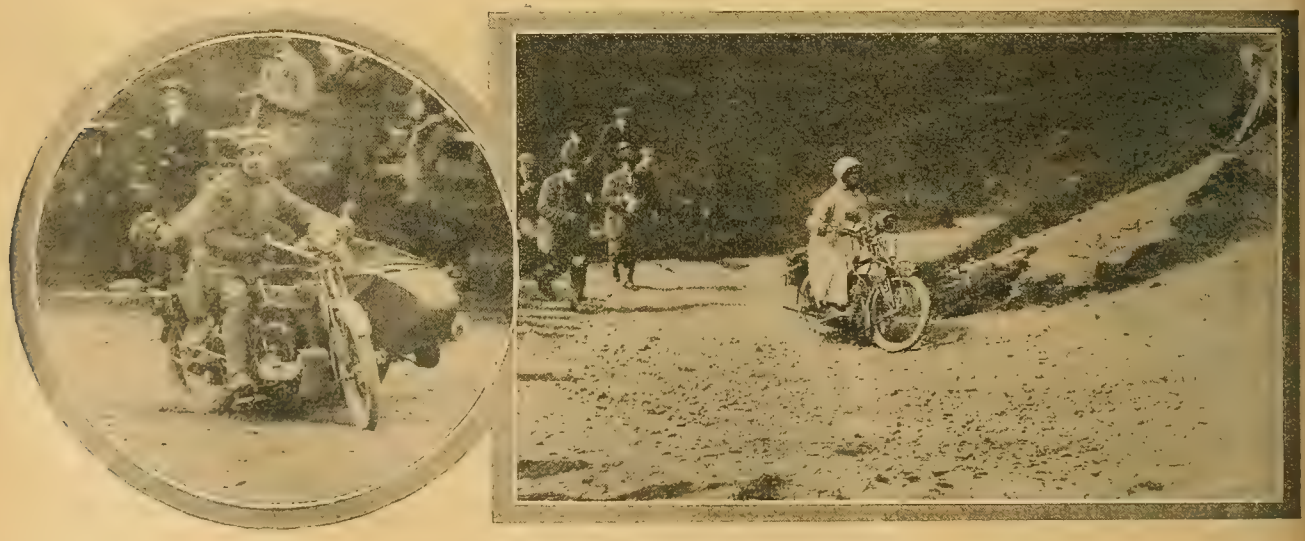
350 c.c. Class.—1, Malvisi (Motosacoche), 6h. 38m. 4s.; 2, Merlo (Frera), 6h. 41m. 9s.; 3, Pozzi (Douglas), 6h. 48m. 41s.

500 c.c. Class.—1, Bordino (Motosacoche), 6h. 11m. 10s.; 2, Feliciani (Ariel), 6h. 24m. 52s.; 3, Gambini (New Hudson), 6h. 43m. 52s.

Not one rider made a non-stop run, punctures being very numerous.

Lightweight and Sidecar Climb Birdlip.

How many lightweights have hauled a sidecar and passenger successfully to the top of Birdlip? The question is prompted by a letter we have received from Mr. W. R. D. Page, Tupsley, Hereford, who states that on the 5th of this month he drove a 2¾ h.p. Douglas, fitted with a sidecar, and carrying a passenger up this well-known Gloucestershire hill. The combined weight is stated to have amounted to 22 stones, and the low gear ratio to have been 12½ to 1. We cannot say that we approve of the practice of thus overloading these small engines, but as an example of what they are capable of doing when put to the test, the feat is interesting.



THE SCOTTISH SIX DAYS' TRIALS.

C. R. Collier (8 h.p. Matchless sidecar) on the first bend of Amulree.

Mrs. Baxter (6 h.p. Rex) at the second corner on Amulree. The first bend may be discerned in the background.

THE OPEN SIX HOURS' RACE.

The Only Event at the Fifth Monthly Meeting of the B.M.C.R.C.

THE RACE IN PROGRESS.—T. Wood (3¾ h.p. Scott), O. C. Godfrey (3½ h.p. Indian), A. Francis (8 h.p. Duo), W. G. Howard (3½ h.p. Matchless), and G. E. Stanley (2¼ h.p. Singer), at full speed.

THE above, which was the only event at last week's meeting, was quite an interesting affair, though, of course, somewhat tedious to watch, especially at the beginning. The entry was wonderfully good, amounting to no less than sixty-four. The rules were simple, and the competition was divided into the usual classes. Division I.—For motor bicycles; Classes A. to E. inclusive. Division 2.—Motor bicycles with sidecars and three-wheeled cycle cars; Classes F. to I. inclusive, *i.e.*, 350 to 1,000 c.c. Division 3.—Cycle cars; Classes J. and K., *i.e.*, 750 and 1,100 c.c. respectively. Replenishment depôts were established near the fork, and at these places only could the machines be filled up. Each competitor was allowed two attendants, which rule, however, was honoured more frequently in the breach than in the observance. The object of the race was to afford the entrants a fair chance of breaking records without going to the expense of special timing, and, as will be seen from the latter part of this report, several important records were broken.

The weather was hot and sultry, and there was no wind. Fifty starters in all, lined up in two rows, faced Major Lloyd at 11.30, and a most imposing group they made. Walking down the lines we noticed several interesting fitments. Applebee and Wood were using special magnetos (Bosch) on their Scotts, exactly like four-cylinder car magnetos. Haswell used a B.S.A. carburetter on his Triumph, and a special pad on the top tube, against which he could lean while lying in racing position, and an extra release valve, consisting of a long pipe issuing from a union fixed in the centre of the timing gear case. Barnes was using his Grand Prix sidecar combination, but fitted with a new and untried engine. He brought the cylinder and piston he used in the French race, and we must say we have never seen anything so badly scored.

Fifty Healthy Engines.

When Major Lloyd gave the word to go at 11.38 a.m. the start was a most impressive one. The two orderly lines of competitors became a confused tangle out of which it seemed no unravelment was possible. The air thundered with the crackle of forty-eight exhausts, and in less time than it takes to write they were all away. Two only failed to start, and these were R. J. Bell (N.S.U.) owing to carburetter trouble, and Riddell (Zenith sc.) In a few minutes the procession came round, Cookson (Matchless) leading by many lengths, while Cocker, Godfrey, Stanley, Howard, and Wood also composed the vanguard. To note the others was an impossibility, and for several hours until the killing speed had weeded out the weaklings there was an endless procession round the track, and the welkin rang with a deafening and ceaseless din. People like Stanley, Wood, Mason, and Cookson could be spotted as travelling well, but in what order the rest were running was beyond the power of man to discern. The first man to stop was Elwell (Douglas) in his fifth lap, which was owing to a stretched valve, which caused him a fair amount of delay. The exhaust of Applebee's Scott emitted a beautiful note. Axford (Martin) had time to glance at the scoring board as he passed. Holden's mechanic was making an adjustment to the engine as his Morgan sped by. Although it was early for trouble to be experienced, several men stopped at this stage. Axford changed his belt in his seventh lap. Bell (N.S.U.) stopped for oil. Newman (Ivy) stopped to fix his silencer and change a belt. Halsall (Veloce) was the first to retire with a burst cylinder, which cracked at the bottom. Newbold (Zenith) stopped with a flat front tyre in his eighth lap, and then Elwell came in again for a brief spell. Barnes, still unfortunate, was the next man to drop out, owing to a cracked cylinder. Sumner (Zenith-Green) was then placed on the retired list owing to the flywheels coming loose.

During a brief respite we had a chance of watching the system some of the rims employed in their depots. Some had none at all and very few spare parts, but by far the most elaborate was the Singer Co., who had a table with three stop-watches and a staff of about four men working a complicated chart, the watches, and making signals to the Singer competitors. The fun was now fast and furious. Knight (Zenith) came in with a rush, violently applied his brake, skidded, and before one had time to realise what had happened his machine was ablaze. Quick as thought, someone applied a powder fire extinguisher, the contents of which were divided equally between the flames and Mr. Albert's coat. The extinguisher, however, got the best of it, and the fire was speedily put out. The machine was then surrounded by willing helpers, who washed away the powder, and in about ten minutes' time the luckless Knight was on the road again. Godfrey retired in his tenth lap owing to a broken piston, and then the Calthorpe came in and changed both rear wheels, which were detachable, and could be removed by undoing three bolts, in remarkably quick time. H. Martin retired in his sixteenth lap owing to a burst cylinder,

E. E. Elwell (Douglas) and F. A. McNab (6 h.p. Trump-Jap) passing De Peyrecave's Duo, which had a broken chain.

The Open Six Hours' Race.—

while his machine had also been on fire near the aeroplane sheds, and there again an extinguisher prevented the motor from being destroyed.

One of the features of the meeting was the announced intention of breaking records, some riders being sufficiently confident to talk openly of annexing all up to six hours. It was, however, anticipated, with the vast improvement in 350 c.c. engines of late, that Sam Wright's long standing twin Humber records would go, and that for the first time on record sixty miles would be covered in sixty minutes on one of these tiny engines. Events proved that the forecasts were not short of the mark, for the wizard engine tuner, G. E. Stanley, covered 62 miles 920 yards in the first hour on a 2¾ h.p. Singer, incidentally annexing the fifty mile record, and Hugh Mason was only a few seconds slower. Robbed by Stanley of the first record, he made amends by collaring the two, three, four, five, and six hours.

Leaders at the End of the First Hour.

CLASS B.—Stanley (Singer), 26 laps; Mason (N.U.T.), 25 laps; Colver and Greaves (Enfields), 24 laps.

CLASS C.—Haswell (Triumph), 27 laps; Wood (Scott) and Pullen (Rudge), 26 laps.

CLASS D.—Axford (Martin), 24 laps; McNab (Trump), 17.

CLASS E.—Cookson (Matchless), 25 laps; Knight (Zenith), 23 laps; Gwynne (Indian), 20 laps.

CLASS G.—Holroyd (Motosacoche sc.), 17 laps; Le Vack (Motosacoche sc.), 16 laps; Riddell (Zenith), 15 laps. In this class Sumner (Zenith) had retired.

CLASS H.—E. B. Ware (Zenith sc.), 20 laps; H. Gibson (Bradbury sc.), 18 laps.

CLASS I.—Holder (Morgan), 21 laps.

CLASS K. (cycle cars).—Hands (Calthorpe), 23 laps; Francis (Duo), 21 laps; De Peyrecave (Duo), 20 laps.

Wood came in with a flat back tyre, and for some moments could not find the tube, which had become tightly wound round the hub. Mr. Scott came to his help. Knight was now going well, but soon his troubles arrived and a burst cylinder put him out of the running. Guest (Matchless sc.) retired owing to a broken inlet valve rocker. The regular running of the little Calthorpe cycle car was now a matter of general talk. Francis (Duo) stopped to have a valve spring replaced, whilst De Peyrecave broke a chain. Newman (Ivy) screwed up a leaky water union, and later Haswell, now leading on his forty-fifth lap, stopped to replace a flat back tyre. Brewster (Norton) broke a piston ring. Stanley gave up after covering fifty-eight laps owing to his tyre being worn down and to having "had enough." The next to retire was Applebee (Scott) in his thirty-sixth lap owing to his petrol tap union coming out of the tank. Baker (Peerless) stopped and wound string round his engine shaft to prevent oil leaking out of the bearing on to his belt. Howard (Matchless) retired owing to his exhaust valve breaking and falling into the cylinder. The leaders at the end of the second hour were :

CLASS B.—Mason (Nut), 43 laps; Stanley (Singer), 43 laps; Greaves (Enfield), 40 laps.

CLASS C.—Haswell (Triumph), 45 laps; Pullen (Rudge), 44 laps; Howard (Matchless), 44 laps.

CLASS D.—Axford (Martin), 41 laps; McNab (Trump), 34.

CLASS E.—Cookson (Matchless), 41 laps; Knight (Zenith), 38 laps; Gwynne (Indian), 37 laps.

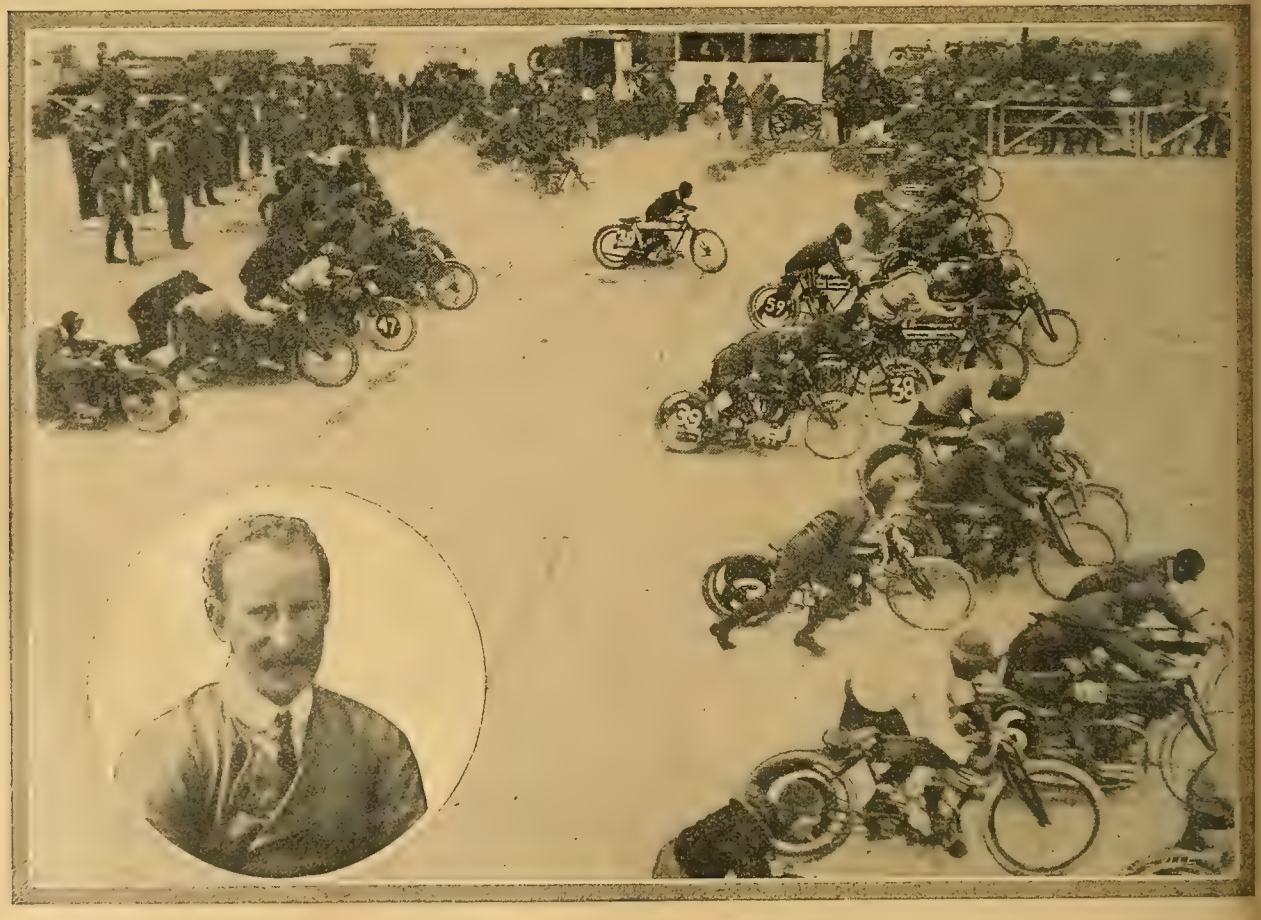
CLASS G.—Holroyd (Motosacoche sc.), 30 laps; Riddell (Zenith sc.), 29 laps; Le Vack (Motosacoche sc.), 19 laps.

CLASS H.—Ware (Zenith sc.), 35 laps; Gibson (Bradbury sc.), 31 laps.

CLASS I.—Holder (Morgan), 35 laps.

CYCLE CARS.

CLASS K.—Hands (Calthorpe), 41 laps; Francis (Duo), 33 laps; De Peyrecave (Duo), 30 laps.



The start of the race. The sight, as may be gathered, was a most impressive one, as the 50 competitors moved off together in two long lines. Inset, J. R. Haswell, the winner.

The Open Six Hours' Race.—

A descriptive headline for the report of this race would be, "Great Battle: Fearful Slaughter." The competition was keen enough, but the number of "killed and wounded" tremendous. Hardly for a moment were the depots empty. True many of the stops were for such trivial adjustments as wiping belts of oil or changing them and replacing valves and plugs, but there were too many of such troubles. After fifty laps pink scoring cards were used. Holder, when dashing down the railway straight, dropped his low speed chain, which wriggled along the track at express speed like a rattle-snake. The Motosacoche driven by Holroyd was going exceedingly well, but the driver was continually raising the valve lifter, probably to get oil on to the rings.

At one point Hugh Mason and his wonderful little N.U.T. led the whole field. The sight of him riding alongside an 8 h.p. mount and holding him for speed was most uncanny. The first to complete fifty laps was C. G. Pullin on a Rudge-multi, who had been closely pressing the leaders all along. Mason followed, and Haswell next. When Mason developed plug trouble he let up Haswell to second position. Edmond's retirement was caused by a stone breaking the glass barrel of his lubricator. Wood, the T.T. winner, was not at all happy, and stopped several times. Haswell took the lead on his fifty-third lap, and thereafter he led the field, though he had to stop to tie his carburetter in position. Thompson's Douglas suffered from overheating, so was withdrawn. Horsman, on the only remaining Singer, was travelling in first-rate style, and was always among the leaders. Cocker had retired owing to a fire. Mason stopped in his seventieth lap to adjust his tappets and fill up, whilst Gwynne took down his carburetter.

Stanley caught up with Mason at the fifty-fifth lap, and kept with him to the fifty-eighth lap. Everyone imagined that there was to be a ding-dong struggle for first place, but when Stanley stopped to replenish he disappointed everybody by stopping for good.

At the end of the third hour the race stood as follows:

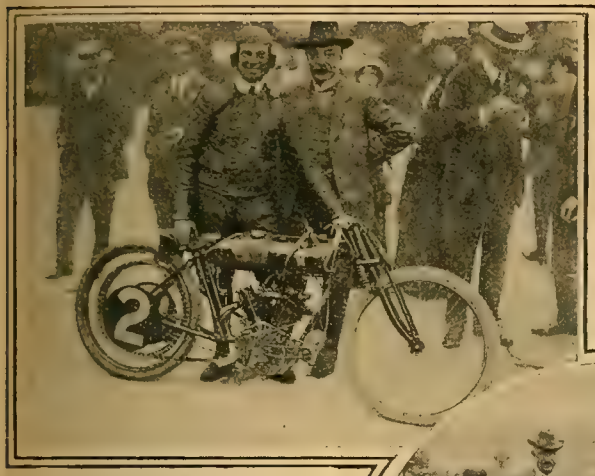
Class B.—Mason (N.U.T.), 64 laps; Colver (Enfield), 58 laps; Greaves (Enfield), 57 laps.

Class C.—Haswell (Triumph), 68 laps; Pullen (Rudge), 68 laps; Horsman (Singer), 63 laps.

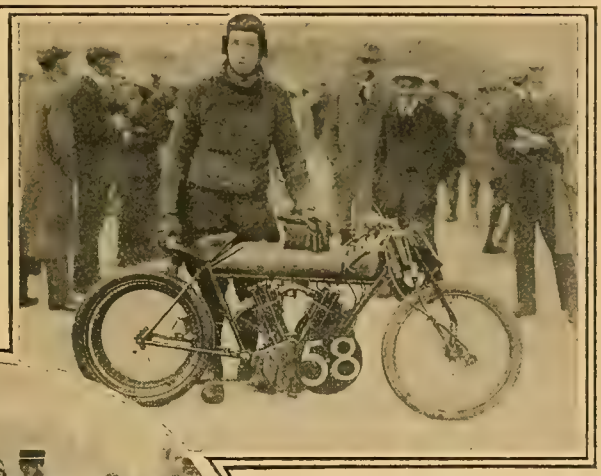
Class D.—Axford (Martin), 61 laps; McNab (Trump), 54 laps.

Class E.—Cookson (Matchless), 56 laps; Gwynne (Indian), 53 laps.

Class G.—Riddell (Zenith sc.), 45 laps; Holroyd (Motosacoche sc.), 43 laps; Le Vack (Motosacoche sc.), 22 laps.

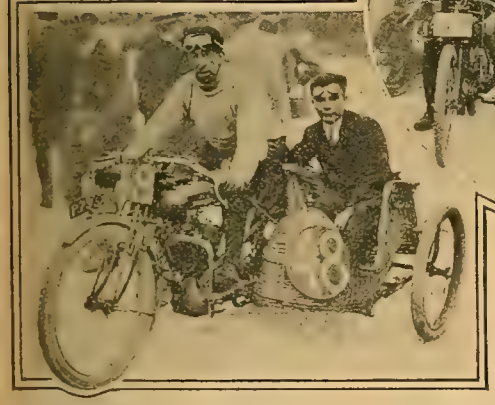


(1) Hugh Mason (2¾ h.p. Nut-Jap), who won the class for 350 c.c. machines, and was third fastest of the day and set up ten new records.



(2) J. J. Cookson (8 h.p. Matchless-Jap), winner of the 1,000 c.c. class with 298 miles 1,180 yards in six hours.

(3) The Enfield team which finished complete, H. V. Colver second, E. Keyte third, and H. Greaves fourth. This photograph is particularly interesting, as it includes Mr. R. W. Smith, managing director; Mr. Patchett, general manager; and Mr. Hare, London manager.



(4) E. B. Ware (6 h.p. Zenith Gradua-Jap sidecar), who won the class for sidecars up to 750 c.c. and incidentally broke nine records.

(5) H. Riddell (3½ h.p. Zenith Green), winner of 500 c.c. sidecar class. In addition he broke three records.

Class H.—Ware (Zenith sc.), 51 laps; Gibson (Bradbury), 48 laps.

Class I.—Holden (Morgan), 53 laps.

Class K. (Cycle Cars).—Hands (Calthorpe), 60 laps; De Peyrecave (Duo), 47 laps; Francis (Duo), 44 laps.

It was now half-time, and the field was considerably thinned.

Riddell's front tyre blew clean off the rim, yet he actually continued to the depot at 20 m.p.h., which appeared to be a risky proceeding.

Horsman got ahead of Mason in the seventy-fourth lap. Newman retired, as he could not prevent oil getting on to the belt, which he had to change several times.

At the end of the fourth hour the positions were:

Class B.—Mason (Nut), 80 laps; Colver (Enfield), 75 laps; Greaves (Enfield), 74 laps; Keyte (Enfield), 70 laps.

The Open Six Hours' Race.—

CLASS C.—Haswell (Triumph), 89 laps; Pullen (Rudge), 86 laps; Victor (Singer), 83 laps.

CLASS D.—Axford (Martin), 72 laps; McNab (Trump), 67.

CLASS E.—Cookson (Matchless), 76 laps; Gwynne (Indian), 60 laps.

CLASS G.—Riddell (Zenith), 59 laps; Holroyd (Motosacoche), 56 laps; Le Vack (Motosacoche sc.), 36 laps.

CLASS H.—Ware (Zenith sc.), 67 laps; Gibson (Bradbury sc.), 58 laps.

CLASS I.—Holden (Morgan), 64 laps.

CYCLE CARS.

CLASS K.—Hands (Calthorpe), 80 laps; De Peyrecave (Duo), 62 laps; Francis (Duo), 51 laps.

It is interesting to note that the Motosacoche driven by Le Vack was fitted with Mr. De Lissa's patent valve. Le Vack had two bursts early in the race, and yet, despite this fact, he was able to pick up lost time, and when the race was over his engine was remarkably cool. After 100 laps the numbers were posted on green cards by the lap scorers. In his sixty-ninth lap Riddell stopped to fill up, and it was noticed that the racing body of his sidecar was coming to pieces. Mason at this stage had several stops owing to the central electrode of the back plug coming loose.

CLASS C.—Haswell (Triumph), 109 laps.
CLASS B.—Mason (N.U.T.), 104 laps.
CLASS C.—Pullen (Rudge), 104 laps.
CLASS K.—Hands (Calthorpe), 97 laps.
CLASS C.—Horsman (Singer), 96 laps.
CLASS E.—Cookson (Matchless), 93 laps.

Mason and Haswell, who, by the way, had accomplished record distances in their respective classes, now stopped for replenishments. Mason was away first, as Haswell had to change a wheel again.

Near the end, Wood thought it advisable to reamer out his jet on the eighty-ninth lap, whilst Haswell pulled up in his 124th lap for a few seconds owing to the carburetter becoming loose again. Mason stopped to replace a missing valve cotter in his 118th lap.

The Six Hours' Race Results.

CLASS B.—Up to 350 c.c.

	Rider and machine.	mm.	c.c.	mls.	yds.
1.	H. Mason (2-cyl. Nut-Jap) ...	60 ×61	350	325	1,092

The racing Scotts, ridden by Wood and Applebee, were fitted with special Bosch magnetos, giving two sparks per cylinder. The wiring arrangement is shown above.

The Public Schools M.C.C.

A hill-climb on Kop Hill, in conjunction with the Herts County open hill-climb, will take place on August 9th.

Bradford M.C.C.

The reliability trial to Edinburgh and back will start on August 9th. The awards will include the P. and M. cup, the George Merrick trophy, and gold medals.

Newcastle and District M.C.

A reliability trial was held last week over a severe course of 179 miles. Results: 1, W. S. Dodds (3½ Singer), error 16s.; 2, G. W. Raper (3½ Ariel), 20s.; first amateur, J. Cooper (3½ Ariel), 61s.; first novice, T. J. Parry (3½ Rudge).

Liverpool A.C.C.

A novel competition was held last week when teams of twins competed against teams of singles. A team of singles scored the greatest number of points, and therefore J. Ball (3½ Meade), H. Marsden (3½ Zenith), W. Sedgewick (3½ Rudge), and J. W. Morland take the club prizes.

The open trial arranged for August has now been postponed to September, owing to the A.C.U. refusing a permit for August 9th.

Oxford M.C.C.

The following competitors have been awarded medals in connection with the reliability trial from Oxford to Llandudno and back.

Gold medals.—C. B. C. Loxley (3½ Triumph), F. L. K. Loxley (3½ Triumph), R. C. Davis (Clyno sc.), and W. A. Mathews (Morris-Oxford light car).

Silver medals for single journey.—J. C. Bellamy.

A special award presented by the B.S.A. Co. was won by H. G. Watson.

A speed-judging competition will take place on the 31st inst.

Inverness and District M.C.C.

A hill-climb took place at Farley Hill, Beauly, on the 12th inst. The hill is about a mile long, exceedingly steep in parts, and, in addition to having two sharp corners, it has no fewer than eight miniature watercourses. The fastest time of the day (83s.) was made by F. H. M. Macintyre (8 R.S.F.-Jap). The results on formula are as follows:

Class I. Machines up to 350.—J. Grant (2¾ Douglas), 169⅖s.

Class II. Over 350 up to 500.—J. Macdonald (3½ B.S.A.), 98⅖s.

Class III. Over 500 up to 1,000.—R. C. Maxwell (8 Matchless-Jap), 88s.

Class IV.—Any machine up to 1,000.—J. Macdonald (3½ B.S.A.), 92⅖s.

Banbury and District M.C.C.

A members' hill-climb recently took place at Irondown Hill, Deddington. Over forty entries were received Results:

Class 1 (any type of motor cycle up to 500 c.c.): Time—1, R. H. Viggers (2½ Calcott); 2, H. S. Askew (3½ Singer); 3, W. H. Fowler (3½ Triumph). Formula—1, R. H. Viggers (2½ Calcott); 2, J. W. Tollody (2½ Singer); 3, H. A. Beard (3½ Premier).

Class 3 (unlimited capacity): 1, F. Wood (2½ Singer); 2, W. H. Tuckey (3 Hazlewood); 3, A. E. Pargeter (3½ Triumph).

Class 4 (sidecars and cycle cars): 1, W. T. Jackson (3½ New Hudson); 2, H. S. Askew (3½ Triumph); 3, H. A. Beard (3½ Premier).

Class 5 (unlimited capacity; award, "Fortescue" Silver Cup for fastest time): 1, A. James (6 Zenith); 2, C. Bidmead (5 Bidmead-Jap); 3, R. H. Viggers (2½ Calcott).

Northallerton and District M.C.C.

This club has just been formed, with headquarters at Northallerton, and arrangements are being made with a view to affiliation with the A.C.U. Full particulars may be obtained from the hon. sec., Mr. W. Y. Stead, High Street, Northallerton.

Leeds M.C.C.

An open gymkhana was held on the 2nd inst. at the Harewood Arms. This was most successful. The results were as follows:

Sidecars.

Adam and Eve Race: R. Cawthorne (3½ Cawthorne).
Balloon-bursting Race: F. K. Langton (4 Bradbury).
Tent-pegging: A. Lees (6 Dot).
Potato Race: V. Gash (3½ P. and M.).

Solo Machines.

Turk's Head: F. K. Langton (2¾ Ariel).
Skilful Driving (obstacles): R. Cawthorne (3½ Cawthorne).
Whistling Competition: J. Izett (2¾ Singer).
About 100 attended.

Mersey (Liverpool) M.C.

The official awards in the open trial to Edinburgh and back are as follows:

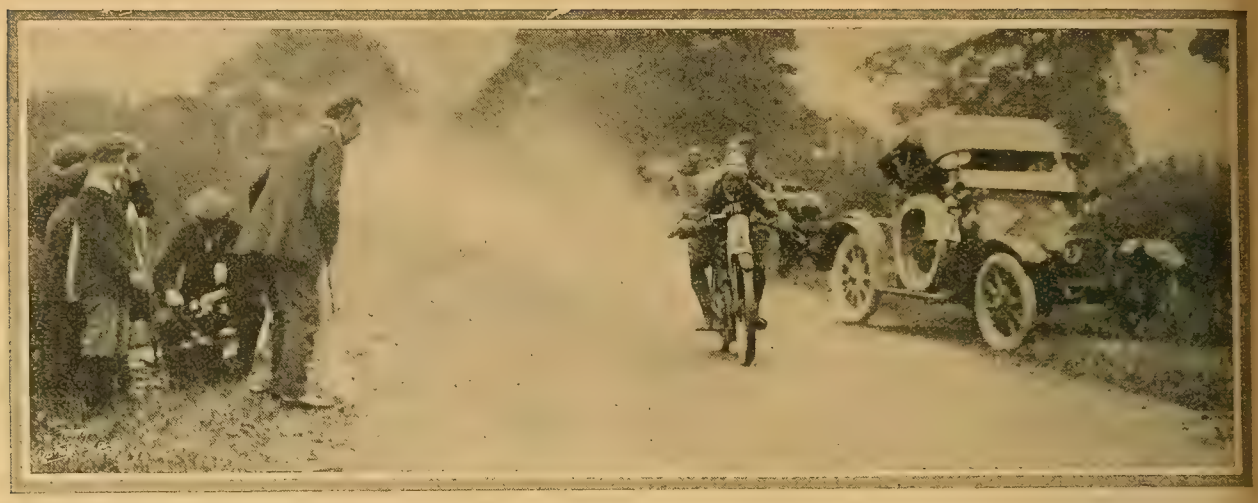
Timson Challenge Cup.—H. Gibson (3½ Bradbury), error 3m. 39s.

Ariel Medal for First Amateur.—S. W. Carty (3½ Ariel), error 5m. 51s.

Gold Medals.—S. W. Carty (3½ Ariel), N. H. Brown (7 Indian), L. Mogridge (3¾ Mead), G. A. Gregson (5 Bat), N. Howarth (3½ Bradbury), H. Gibson (3½ Bradbury), A. C. Naylor (2¾ Douglas), W. H. Youd (3½ Matchless), W. H. Kelly (8 Rex-Jap), C. M. O'Connor (5 Rudge sc.), J. J. Day (3½ Bradbury sc.), W. H. Longton (3½ Alldays sc.), J. McG. Lamb (6 Clyno sc.), L. R. Pearson (6 Clyno sc.), C. V. Freeman (6 Clyno sc.), and F. C. Jones (10 Singer cc.).

Silver Medals.—T. V. Barton (6 Rex), J. Sedgwick (5 Rudge), A. G. Cocks (2½ Connaught), A. Marston (6 Dot), H. J. Beal (4 L.M.C.), M. Rimmer (3½ Zenith), G. Nott (6 Clyno sc.), A. J. Jenkins (3½ New Hudson sc.), J. W. Meredith (6 Clyno sc.), G. Wray (6 Clyno sc.), N. C. Sclater (8 Matchless sc.), and J. A. Yeoman (8 Crouch cc.).

The Crossgate Team,—winners of the invitation shield and standard gold medals in the Bradford M.C.C. Inter team trial to London and back. The three riders are J. Stuart White, H. E. Haswell and J. Tattersall, all of whom rode 3½h.p. Bradburys.



H. R. Davies (2¾ h.p. Sunbeam) first on formula in Class I. for 350 c.c. machines in the Sutton Coldfield A.C. hill-climb. He is about to cross the tape at the start.

Salisbury (Rhodesia) M.C.

A club has now been formed here with title as above. The joint hon. secretaries are Messrs. A. R. W. Davies and B. Wright.

Sutton Coldfield and Mid-Warwickshire A.C.

The members' hill-climb was held near Cropredy, in Oxfordshire, last Saturday, on a gradient of about 1 in 14. The club had been refused permission for a hill in five different counties. Results:

CLASS I.—350 c.c.

F. S. Whitworth (Douglas) ... 43⅖s.
H. R. Davies (Sunbeam) ... 44s. ... First on formula.
H. Newey (Levis) ... ... 45⅗s.

CLASS II.—351 to 520 c.c. Amateurs.

R. H. Edwards (Triumph) ... 43⅖s. ... First on formula.
C. A. Gould (Corah-Jap) ... 48s.

CLASS III.—351 to 520 c.c. Trade or amateur.

D. M. Brown (Rover) ... 41⅗s. ... First on formula.
R. H. Edwards (Triumph) ... 44⅕s.
F. Sangster (Ariel) ... ... 47s.

CLASS IV.—Singles and twins over 521 c.c.

H. R. Lane (8 Rex-Jap) .... 48⅕s. ... First on formula.

CLASSES V. AND VI.—Sidecars.

H. Riddell (3½ Zenith-Green) 57⅕s. ... First on formula.
H. R. Lane (8 Rex-Jap) ... 58s.
F. S. Whitworth (2¾ Douglas) 63⅕s.

CLASS VII.—Cycle cars.

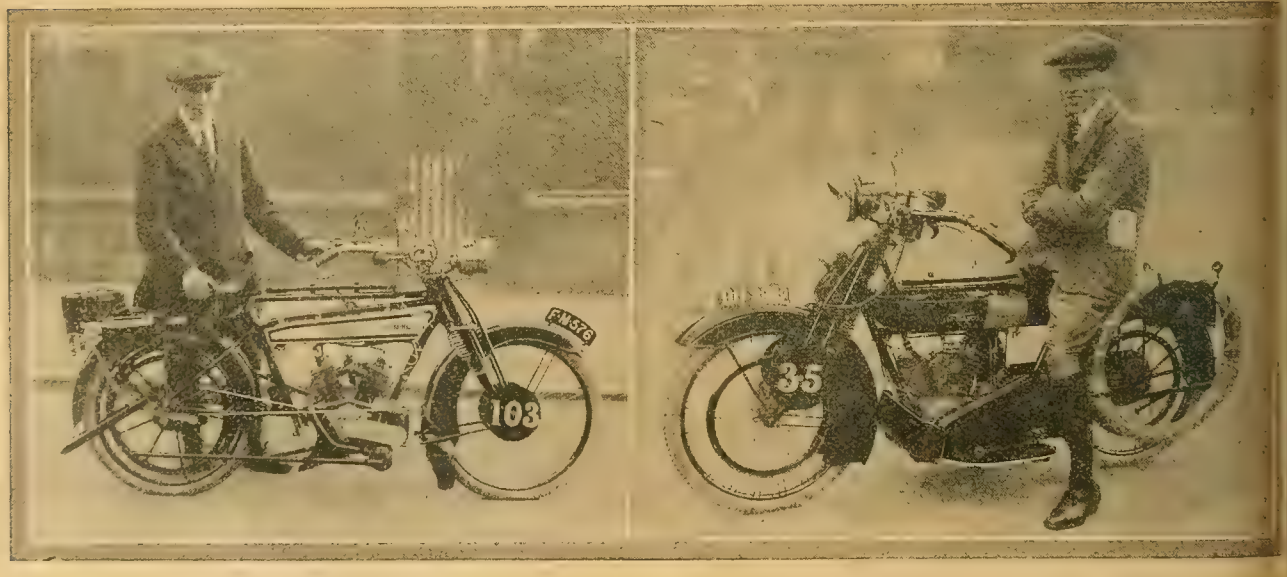
W. D. South (Morgan) ... 76s. ... First on formula.

The Motor Cycle formula was used both in the motor cycle and car classes.

Dublin and District M.C.C.

The above club held an open reliability trial on the 19th inst. over a circular course of about seventy-two miles, the ascent of Sugar Loaf being the only difficult piece of country. Out of twenty-four entries, twenty-two riders faced the starter, Mr. R. J. Dodd. The following were on time at the open controls: J. Browne (3½ Rudge), C. B. Franklin (7 Indian sc.), W. J. Henderson (3½ Rudge), R. McDonnell (2¾ Douglas), T. D. Rollins (5-6 Clyno sc.), S. L. Wilson (3½ Rover sc.), A. W. Mooney (3½ P. and M. sc.), G. Roche (3½ Rover sc.), J. H. Taylor (5-6 Rudge sc.), J. Levins (3½ Rudge), P. O. Sullivan (3½ Humber), C. M. Guinness (3½ Rudge), T. Woods (3½ P. and M.), J. Phillips (3½ Rover sc.), G. P. Harrison (3½ Rudge), and F. M. Summerfield (3½ New Hudson sc.).

NEW MACHINES IN THE SCOTTISH TRIALS.



The Charles Edmund spring frame machine. The latest model Lea-Francis ridden by C. I. Francis.

AMONG THE ACCESSORIES.

To Prevent Creeping.

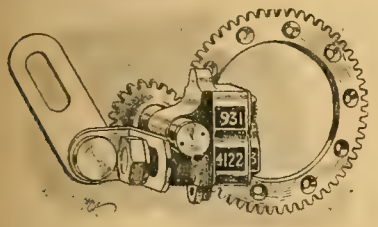
We have been doing our best to impress upon riders the necessity of using security bolts to prevent their tyres creeping in races. We herewith illustrate an invention which is designed to

A substitute for security bolts with beaded edge tyres, introduced by H. Taylor and Co.

supersede security bolts. The tyre itself is furnished with projections, which may be made of any suitable material, upon that part of the bead which lies next the rim. These projections are forced, when the tyre is inflated, firmly into holes in the rim formed to receive them, and thus the tyre is prevented from creeping. This method has been protected by the inventors, Messrs. Thacker and Lawrence.

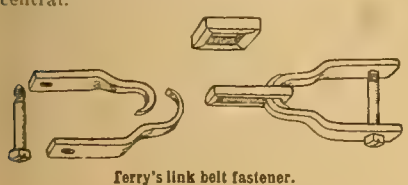
A Reliable Mileage Recorder.

Messrs. Markt and Co., Ltd., 98-100, Clerkenwell Road, E.C., are responsible for the introduction of an accessory which



Messrs. Markt and Co.'s gear driven Veeder trip odometer.

should specially appeal to motor cyclists. This is a gear-driven Veeder trip odometer, specially designed for motor cycle work. It is fitted to brackets which are adjustable in any direction, and it will readily adapt itself to any machine on the market. The instrument is neat, compact, and absolutely accurate. Some method of taking the mileage is especially necessary on a motor cycle, and by its means one can check the tyre wear, petrol consumption, etc., and also cost of running per mile. Naturally, in mounting the instrument care should be taken that the wheels do not mesh too deeply, and that the driving rings are absolutely true and central.

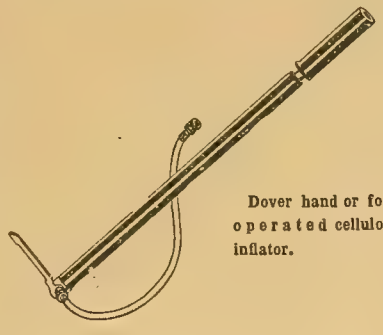


Ferry's link belt fastener.

A Well Made Inflator.

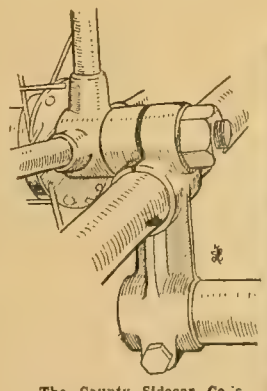
The motor cycle inflator we illustrate is the production of Messrs. Dover, Ltd., of Northampton and Coventry. Its special feature lies in the direction of the Exonite barrel, which is so treated that it is practically as stiff as a metal barrel, but of course it retains the advantage of great lightness.

The foot extension has been improved, and a good feature which is often absent from pump connections is the swivel for attachment to the valve. In many instances the swivel will not turn without twisting the tubular connection; the Dover pump connection is quite free and revolves very easily, and when it is screwed home on the valve thread the joint is quite airtight.



Dover hand or foot operated celluloid inflator.

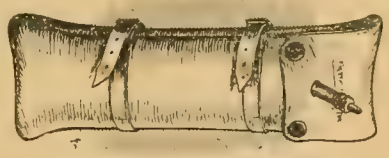
Mr. A. E. Dover showed us an arrangement for connecting lamps to generators which will interest cycle car owners. He has utilised a set of inflator connections on his car in place of the usual push-on rubber tubing. The metal tubes extending along the sides of the frame are fitted with screwed ends like a tyre valve, and the lamps and generator are similarly provided. When the lamps are requisitioned the inflator connections are screwed on, and as the joints are airtight they take the place of the push-on rubber tubing, which if not specially made with thickened ends invariably gives trouble sooner or later by splitting. The inflator connections are also much neater than the average tubing, and the braided tube can usually be purchased to match the colour of the car.



The County Sidecar Co.'s Perfecta sidecar, showing dropped frame and method of fixing mudguard.

A Neat Tube Case.

Messrs. Maude's Motor Mart, 136, Great Portland Street, W., have just introduced an exceedingly nice form of inner tube case, made in soft leather, and with straps fixed on to it for attaching to any convenient portion of the machine. The case is about one foot long and four inches wide. The end is provided with a flap, in which there is a hole through which the valve passes. The flap is then fastened down with the aid of spring fasteners. When the tube is in position it can be inflated slightly, to obviate any chance of chafing.



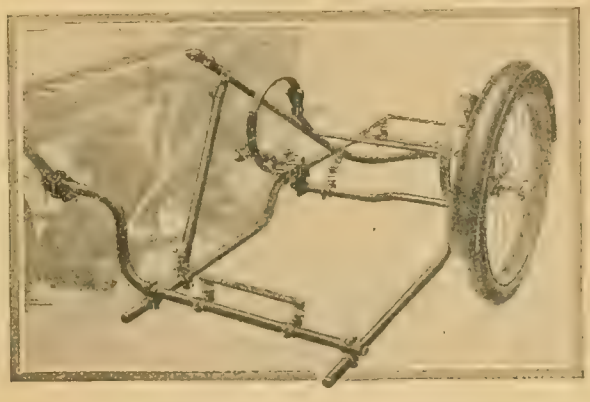
Leather case for carrying spare inner tubes.

A Dashboard Watch.

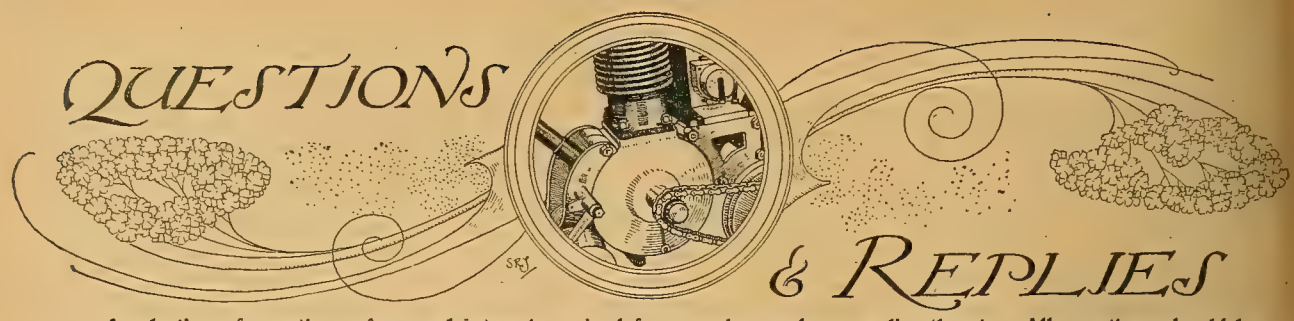
Cycle car owners will be interested to hear that a very neat and inexpensive dashboard watch is now on the market. The watch may be had in a brass or plated case fitted at a convenient angle. It is keyless in action, and the hands may be set from the winder without opening the case. All parts are strongly made to withstand vibration, and the watch has a lever movement and is non-magnetic; the whole may be obtained for the modest sum of 6s. 9d. from Bransom Kent and Co., Ltd., 40, Great Eastern Street, London, E.C.

A Brazeless Sidecar Chassis.

We have recently seen a sidecar chassis which embodies some rather curious features. The entire chassis contains not a single brazed joint, all the members being held together by clips. Extra strength is claimed for this construction, as the tubes are not burned or damaged in brazing. These clips allow the cross-bars and fixings to be slid into any position, and lining up becomes a simple job. The C springs are reversed, as will be seen from our illustration, and a diagonal fixing joins the seat tube connection to the front of the side member. The front of the body is carried on coil springs, and a luggage grid is fitted.



The County Sidecar Co.'s brazeless sidecar chassis.



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Lancaster to Birmingham.

Will you kindly oblige me with the fastest road from Lancaster to Birmingham, entering the latter city by Walsall and Handsworth Wood?—S.P.L.

The shortest route is as follows, but the Wigan-Warrington section is trying: Lancaster, Preston, Wigan, Warrington, Northwich, Middlewich, Sandbach, Newcastle, Stone, Stafford, Penkridge, Cannock, Walsall, Birmingham. A pleasanter road is: Preston, Ormskirk, St. Helens, Warrington, Tarporley, Whitchurch, Newport, Watling Street, Gailey, Wyrley, Bloxwich, and Walsall.

Electric Lighting Outfits.

Can you give me the addresses of makers of electric self-generating motor cycle head light outfits? Also, can you tell me if there is an oil lamp suitable for a motor cycle, to be used for short distances?—F.B.R.

We do not know of an oil lamp suitable for a motor cycle, but there are several self-generating electric outfits on the market, such as the "Berko," sold by the Service Co., Ltd., 292-293, High Holborn, W.C., and that sold by Weill Bros., Hatton Garden, E.C.

Balance.

As the cylinder of my 1911 3½ h.p. machine is rather worn, I am thinking of fitting a steel piston. I presume that the difference in weight between a cast-iron and a steel piston would necessitate drilling holes in the periphery of the flywheel. I should be glad if you would give me your opinion in the matter, as a well-known trade rider tells me that I need not touch the flywheels, and that the extra weight on one side will make the engine turn over more readily at high speeds.—C.H.G.

We should imagine that your engine would vibrate at high speeds. Possibly it might not. Your best plan would be to test it for vibration, and if the vibration is bad, to drill metal out of the periphery of the flywheels till the balance is better. The best method is as follows: Stand the flywheels beside weighing scales. Place the piston on the pan, keeping connecting rod horizontal; this gives reciprocating mass. Opposite the crank pin and at the same radius, hang a weight equal to half that of the reciprocating mass, by means of a small hole drilled in the flywheel and a bent wire. Next, place the whole upon two level rods with a main shaft on each rod, and test for balance. The flywheels should remain in any position; if they do not, drill out metal from the heavy side until the balance is perfect. It is essential to drill the same amount of metal out of each flywheel.

Removing Tar Stains.

I have purchased a second-hand grey coach-built canoelet sidecar. It is slightly soiled with small tar splashes. Is there any means of removing this without spoiling the varnish work? Also, what is the cause of a gas lamp continually jumping and very often going out when travelling on a rough road? What carbide do you recommend to get the best results?—W.P.

If the tar has been allowed to set really hard it would be difficult to remove it, but you might try a gentle application of Chemico car polish, applied with a piece of wadding. The trouble with the lamp is probably due to water in the gas pipe. Any make of carbide will do. The carbide, however, should be preferably of a small size.

Overheating and Carbonising.

I have an 8 h.p. twin J.A.P. Last season it ran quite cool, but in the autumn I had a new big-end bush put in, which made it run very stiffly for the start, but it soon became free again. I have also fitted three new rings, but I cannot run without overheating very quickly. I have tried oiling more and less, but find no difference. I take the cylinders off after about 150 miles, and there is a thick hard deposit in the cylinder top. The rings are quite bright all round, although I believe the cylinder has worn slightly oval sideways, and the crank case gets very hot.—C.J.C.

We should imagine that you are running on rather too strong a mixture, and possibly the rings require a little longer running in. It is quite possible that when the new big end was fitted the oilways were not cut correctly, and this may account for the overheating symptoms of which you complain. The fact that the crank case gets very hot and that the cylinder has worn oval appears to show that the charge is getting past the rings, though the heat may be due only to conduction, in which case it is of no consequence.

THE GRAND PRIX. One of the fastest stretches of the course. The leader is advising the driver in the rear of his approach to a corner.

EVERYBODY KNOWS that a

specially tuned machine by a good maker, ridden by a picked rider, whose business in life is to do nothing else, can accomplish a good performance in a hill-climb or race, but there is only one make of motor cycle that, taken from stock exactly as supplied to the public, will equal the performance mentioned in the following extracts from a customer's letters. That machine is, of course,

SCOTTISH BORDER The **UNAPPROACHABLE**

M.C.C. OPEN HILL CLIMB, July 12th (3½ h.p. long stroke, 490 c.c.)

FASTEST SINGLE CYLINDER, beating 6 & 8 h.p. twins easily

NORTON

Extracts from customer's letters :—

July 10.

I am riding at Hawick on Saturday, but am not going to do any special tuning, as I want to see what a machine as received from the makers can do.

Yours faithfully, ROY G. MACGIBBON.

July 12th.

As I mentioned in my last letter I rode out to Jedburgh on Saturday, and took part in the hill-climb organised by the Scottish Border M.C.C.....The results you will see in "The Motor Cycle," but for your information I may say I won class 4 (open) and class 9 (general) making **fastest single-cylinder time of the day.**

Yours faithfully, ROY G. MACGIBBON.

I may say that I adhered to my plan of not touching the engine.....which shows that one firm at least send out their machines properly tuned up and run in.

POWER and plenty of it!

FIRST

ON ROAD AND ON TRACK

Following upon its brilliant victory in the JUNIOR T.T. RACE the N.U.T. has established.

10 NEW WORLD'S RECORDS.

The magnificence of the performance will be at once appreciated by the wide margin that separates the previous records and the new ones, set up by Mr. Mason on the N.U.T.

This record breaking achievement is of great significance, following so closely on the Isle of Man triumph. It demonstrates the phenomenal efficiency of the machine both on the road and on the track. It proves also that a motor cycle capable of such speed and endurance must be one of the front rank eminence—in design, construction, material, and workmanship.

Our catalogue fully describes the N.U.T. Please write for a copy.

BROOKLANDS 6 HOURS RACE, JULY 16th .. .. CLASS B

SIR WM. ANGUS, SANDERSON & CO., LIMITED, NEWCASTLE-ON-TYNE.

From the Midlands to the North.

Will you tell me the best route from Thrapston to Warkworth (Northumberland), avoiding as much of the Great North Road as possible? I am aware that the Great North Road is the best and most direct route, but I have been along it so many times that I am getting tired of it. I should like to avoid all big towns. I intend riding 1½ days.—G.H.P.

our best route would be as follows: hrapston, Oundle, Peterborough, Bourn, eaford, Lincoln, Brigg, New Holland, ull, Beverley, Market Weighton, York, hirsk, Yarm, Stockton, Durham, Newstle, Morpeth, to Warkworth. It is uite impossible to avoid all large towns n this trip.

A Carburetter Difficulty.

I have a 3½ h.p. machine fitted with a Longuemare carburetter. When the engine is running all seems well, but when it stops petrol drops very freely from the bottom of the carburetter. Is the petrol level at fault? If so, how am I to remedy same? Would you also explain the difference between the ordinary engine and the two-stroke engine as used on the Scott machines? —H.E.D.

here is probably a piece of grit under he needle valve seating. Lift up the eedle valve between the finger and humb and turn it round in the seating. t would take too long to explain dequately the difference in working an rdinary engine and a two-stroke engine. f, however, you purchase a copy of Motor Cycles and How to Manage hem," which can be obtained from any ookstall, or from these offices, price s. 2d. post free, you will find the subect fully explained therein.

Lack of Flexibility.

My mount is a 5-6 h.p. two-speed 1911 Rex with overhead inlet valves. I use the machine continually with heavy sidecar, and it is a very powerful machine on hills. My trouble is the machine does about 20 to 30 m.p.h. and will not do more than 30 or less than 20 m.p.h. When in free engine the machine seems to run practically the same speed, and will not get up to very high speed, and also will not throttle down to run slowly. B. and B. carburetter. Jet 28. Is this about the right size? The inlet valve springs do not seem very strong; should they be? There are no air leaks about unions to cylinders. With 4½ to 1 gear, how fast should this machine go with sidecar, and about what is the slowest running I should expect on the same top gear with both cylinders firing?—F.F.

The trouble appears to be simply one of carburetter adjustment. Get into communication with the makers of your carburetter, Messrs. Brown and Barlow, Ltd., Westwood Road, Witton, Birmingham, and put your trouble before them. The inlet valves should not open when shaken violently by hand. The machine should do about 40 m.p.h. on a 4½ to 1 gear, and should be capable of being throttled down to about 8 m.p.h., or less, if the carburetter is adjusted for slow running.

The Question of Balance.

My long stroke single-cylinder engine has always given off a lot of vibration at speeds over 25 m.p.h. and has given off a ringing knock, which I have been quite unable to locate. I am of opinion that the heavy flywheels are too heavy on the rim and this upsets the balance of the engine at speed. Am I correct in stating that the heavy end of the flywheels should exactly balance the piston? When I hold my piston up at the top of its stroke the flywheels will immediately bring it down fast on releasing it. Should this be correct? If not, what is the correct method of testing balance? The engine runs well otherwise at all speeds under 25 m.p.h., and climbs well. The bushes are all right.—C.E.T.

It is very difficult indeed to give any decisive reason as to the knocking you complain of unless one can examine the machine. A "ringing knock," of which you complain, may be due to a variety of causes, imperfect lubrication of a bearing being the most likely reason. With regard to the balancing question, this is an exceedingly intricate matter, and unless you are a skilled motor engineer we should not advise you to tamper with the flywheels at all. Remember that it is reasonable to suppose that the maker of the engine has worked this matter out to his satisfaction, and that the balance of the motor as supplied to yourself is the result of careful calculation and design. Broadly speaking, the balance weight on the flywheels should equal the weight of the big ends, plus half the weight of the connecting rod and piston. In the issue of October 10th last, this matter was dealt with in "Queries." See also previous page. With regard to your remarks *re* holding the piston at the top of its stroke and then releasing it, on which it falls rapidly, we presume you mean that you have the cylinder off, as otherwise the closing of the valves would stop progress of the piston on its travel. From what you say, we should imagine that the balance weights on your flywheels are heavier in proportion to the weight of the reciprocating parts than the proportion we have indicated above, and as the question of balancing is not one of rule of thumb, but one about which designers hold slightly different opinions, we do not think that the vibration you complain of is necessarily caused by imperfect balance. Probably, it is due to some other cause, such as a slightly slack piston or play in the connecting rod bearings; but it is impossible to say definitely with the details as supplied. We advise you to get a first-class motor cycle tuner to examine your engine.

Marlow to Ashbourne and Penrith.

Can you recommend route avoiding the Black Country or any uninteresting places, etc.—Marlow to Ashbourne, Derbyshire (for Izaak Walton Hotel, Dovedale); thence to Temple Sowerby, near Penrith (through West Riding if possible), and another way back to Marlow?—A.J.G.

Your best routes will be as follows:—Marlow to Ashbourne: High Wycombe, Aylesbury, Buckingham, Towcester, Weedon, Daventry (turn to the right at foot of hill in town), along Watling Street, to Red Gate Inn, near Atherstone, turn right, Tywcross, Ashby-de-la-Zouch, Melbourne, Derby, to Ashbourne. Ashbourne to Penrith: Ashbourne, Matlock, Chesterfield, Worksop, Tickhill, Doncaster, Ferrybridge, Boroughbridge, Catterick, Scotch Corner, Barnard Castle, Bowes, Brough, Appleby, to Penrith. Alternative route home: Penrith, Kendal, Kirkby Lonsdale, Singleton, Skipton, Ilkley, Otley, Harewood (join Great North Road near Boston), Doncaster, Retford, Newark, Stamford, Grantham, St. Neots, Bedford, Ampthill, Dunstable, Tring, Beaconsfield, to Marlow.

M. Canouel on the Sphinx-Globe cycle car which finished third among the cycle cars, less than ten minutes behind the leader. This car had an air-cooled single-cylinder engine and is very fast.

EXPERIENCES WANTED.

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries below should be addressed c/o The Editor.

"G.B." (Dublin).—Wear and non-skid properties of Stelastic tyres.

"Fear Not" (Burnley).—5-6 h.p. F.N. General reliability.

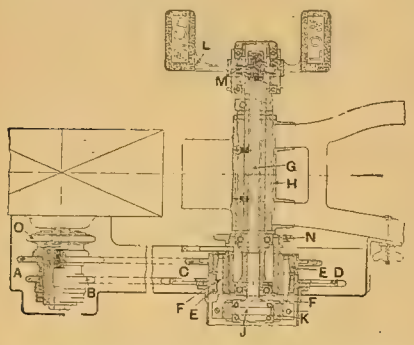
"J.S." (Wolverhampton).—Reliability of kick starters.

"A.H." (Leeds).—Other carburetters compared with standard on 1912 Clyno. Economy, flexibility, and hill-climbing.

"S.R." (Stockport). — 1913 7 h.p. Indian two-speed (solo). Reliability, weight, and suitability of 3in. tyres for cornering.

A Two-speed Countershaft Gear.

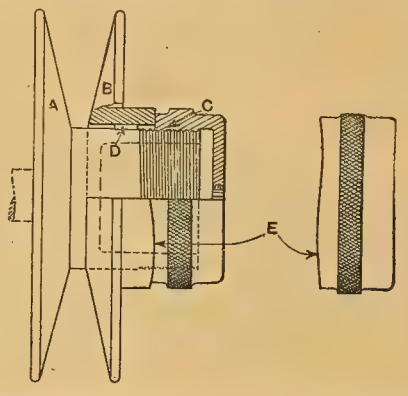
As will be seen this gear is of the type in which two chains take the drive from the engine to the gear, a single chain transmitting the motion to the driving wheel. The engine sprockets are shown at A B, and transmit the drive to the sprockets C D respectively. Within the sleeve carrying these sprockets are expanding clutch members E, which are coned on their inner faces as illustrated, and engaged by wedge bars F of corresponding shape. Operation of the



wedge bars is effected through a rod G passing through the bottom bracket H and provided at J with ball bearings around which is a sleeve K on which the wedges are mounted. The sliding of the rod G is brought about by a pedal L having a screw thread connection therewith as shown at M. It will be seen that the total travel of the wedge bars from either extreme end provides first one gear, then an intermediate position in which neither clutch E is engaged, and finally brings the other gear into engagement. N is the sprocket transmitting the final drive, and O is a sprocket engaged by a kick-starter of any suitable kind.—A. J. Rigby and H. B. Bates, No. 11,724, 1912.

The Lindum Variable Pulley.

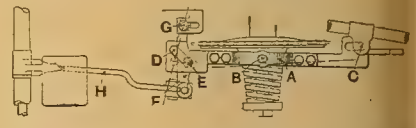
In the construction illustrated, possibly the limit of simplicity, coupled with efficiency, has been reached, the whole pulley comprising merely three parts—



the fixed flange A, the movable flange B, and the locking nut C. The movable flange is keyed, as shown at D, on the boss of the fixed flange, so that it can slide but not rotate thereon. The locking nut C screws upon the fixed boss, and the engagement between the nut C and the movable flange B is effected by undulating surfaces E cut on the two members. When adjusted to the desired position the belt is put in place, and it will be clear that the keys D prevent the movable flange rotating, whilst the undulating surfaces prevent rotation of the locking nut C, so that all is held secure until the belt is removed, when simple rotation of the nut allows the adjustment to be varied.—R. S., A. E., W. H., and M. A. Osborne, No. 22,396, 1912.

Clutch Operating Mechanism.

The plan view shows a link system whereby the actual clutch actuating element A (which takes the form of a yoke engaging trunnions B on the movable clutch member) is caused always to move in the true axial line of the clutch. The yoke A has a slotted connection to the frame at C, and at the other end has a slot D engaged by a



peg E on a bar F pivoted at G. This bar F is connected up to the clutch pedal by a rod H, and the disposition of the slots and pivots provides the desired result.—H. R. Purchase and the Rolfe Mfg. Co., Ltd., No. 7,648, 1912.

Grand Prix Equipment.

The Rudge machine on which T. E. Greene secured first place in the Grand Prix at Amiens was fitted with a C.A.V.-Ruthardt magneto, as was the case with the winning Bedelia cycle car. Continental tyres were also fitted to Greene's Rudge, and to the Bedelia.

Brooklands Successes.

It is interesting to note that Mason's Nut-Jap, which made such a super excellent performance in the B.M.C.R.C. race, had a U.H. magneto. Riddell (Zenith sc.), who also gained a new set of records, favoured a similar magneto.

Tyres in the Grand Prix.

Dunlop tyres and belts were very conspicuous in the French motor cycle, sidecar, and cycle car events at the Grand Prix meeting at Amiens. Seven out of fifteen competitors who finished used Dunlop belts, almost 60%, while the tyres were fitted to various makes, including the Clément on which Fenton won the race in the 350 c.c. class.

Triumph Success in New Zealand.

At a recent hill climb in New Zealand up Faskakariki, which is said to carry with it the hill-climbing championship of that country, Triumph machines were remarkably successful. G. B. Brown was the winner, and beat the record for the hill by 8⅘s., his time being 4m. 11⅕s. The special prize for amateurs was won by A. B. Collins, on a Triumph, who made second fastest time.

Clincher Successes.

In the recent cycle car race for the Yorkshire Auto Club cycle car challenge cup, the Winco car, recently placed on the market by Messrs. Stringer and Co., of Sheffield, fitted with Clincher tyres as standard, proved the winner. This, in addition to the many other recent successes, show that the North British Clincher tyres are in every way satisfactory.

An Excellent Lightweight.

The N.U.T. motor cycle is not only a speed machine, but has also been proving itself lately an excellent touring mount as well. In the recent Cumberland County M.C.C. twenty-four hours' reliability run on the 28th and 29th ult. we learn that the 2¾ N.U.T. ridden by J. Robinson was the only solo machine to make a non-stop run, lose no marks, and finish dead on time. For this excellent performance it was awarded the Christopher Lowther Challenge Cup and gold medal.

The Robbialac Competition.

Messrs. The County Chemical Co., Ltd., Bradford Street, Birmingham, inform us that they have received a large number of applications from persons desirous of entering this competition who have not their addresses to their applications. It will be remembered that this firm are offering ten Clyno sidecar outfits for the best pieces of enamelling sent in done with Robbialac.

Appreciation of Victor Tyres.

Ray Abbott, who ran second by a very narrow margin in the Senior T.T. this year, is a rider whose opinion of a tyre should be worth consideration. He has expressed himself as delighted with the Victor tyres fitted to his sidecar combination just previous to the last London-Edinburgh run. He says that he has now completed nearly 3,000 miles, including a victory in the Essex Motor Club's hill-climb (Passenger Class), and the tyres are still in excellent condition.

British Success in Spain.

Messrs. Brown Brothers, Ltd., have just heard of an interesting win on one of their 3½ h.p. machines, ridden by Senor Marceliano Cuesta in the motor cycle race at Mieres (Asturias) on the 25th ult. The machine was a standard 3½ h.p. single-cylinder Brown, and was the only machine which completed the whole course, which was an exceedingly difficult one. It consisted of a circuit of 47 km. over very hilly country, in which sharp curves and steep gradients abounded. Cuesta made two complete circuits in 2 hrs. 36 mins.

B.M.C.R.C. SIX HOURS' RACE MEETING

ZENITH

"The Summit of Ambition"

SWEEPS the BOARD in TWO CLASSES.

Class G. 500 c.c. and Sidecar—ZENITH FIRST.
Class H. 750 c.c. and Sidecar—ZENITH FIRST.

FOUR ZENITHS in all, completed the FULL SIX HOURS

A SPLENDID PROOF of ENDURANCE coupled with SPEED.

TO THE RIDER who contemplates owning a Passenger Machine, the above, coupled with the fact that the ZENITH holds all the Sidecar Records (except two in Classes C and D) must appeal strongly. To put it briefly—if you want the BEST SIDECAR MACHINE you must have a ZENITH. Catalogue sent with pleasure.

The following NEW TIMES were put up en route and, subject to confirmation by the A.C.U., rank as RECORDS.

Class C, with Sidecar and Passenger.

THE WATSONIAN PATENT FOLDING SIDECAR.

THIS invention has been brought about to minimise space, combined with solidity and durability of a rigid built car. It is built up with material introduced by the best of experts.

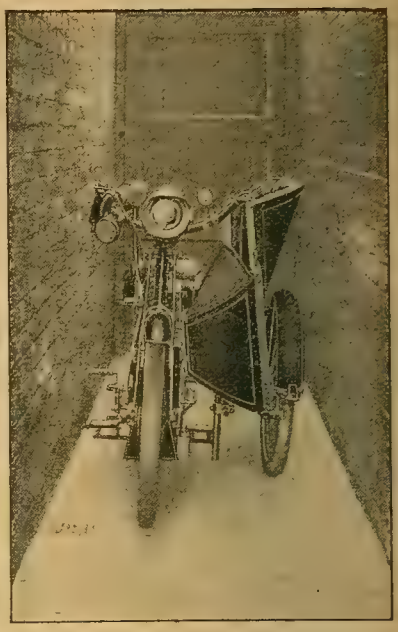
Steel pins, which form its hinged joints, are fitted with castellated nuts and cottered, which creates a solid and sound construction which is equal and superior to many rigid built cars.

The great Storage Problem has been solved by this invention.

The motor cyclist whose garage accommodation is limited, can save expense, worry, and trouble by purchasing our **Folding Sidecar.**

It will pass through a 2ft. 8in. doorway attached to the machine.

It has been through most of the Midland reliability trials since last November without a mishap, and we give a 12 months' guarantee with each car.



The Patent Collapsible Sidecar Co., Limited,

MOTOR CYCLISTS—PLEASE NOTE!!!

COPY OF LETTER. Masonic Hall, Barton-on-Humber, June 29th, 1913.

Gentlemen,

The £1-4-0 model speedometer which I had from you a few months ago has just registered 5,000 miles without any renewals or trouble, and has never varied in its accuracy.

It has enabled me to reach a given destination to time, and with its help I can keep to time as accurately as a crack train.

To my mind it is perfect, and those of my friends who have been persuaded to go in for one, all agree it is the best on the market.

Wishing you every success,

I remain, yours faithfully, (Signed) TREVOR T. LAKER.

EXTRACT FROM A LETTER FROM RONALD W. PICKERING.
July 8th, 1913.

"I have had Speedometers of three other makes, but not one of them is an equal with yours. The price is as low, and the instrument far better value, *i.e.*, the hand is perfectly still at all speeds on yours, but on all others I've tried, the opposite is the case."

The Scottish Six Days' Trials.

LAST week's Scottish Trials proved a most gruelling test, and the fact that such a large proportion of machines got through successfully is a striking proof of the absolute dependability of the present day motor cycle. But trouble was not absent; far from it. Apart from the usual crop of troubles which can generally be traced to machines having been hurriedly assembled and prepared for the event, not a few retirements have been caused by the inability of the riders themselves to continue, though their mounts have been in almost perfect order. Falls have been far too frequent, and this can mainly be put down to the freakish corners and stony surfaces, combined with the strange roads, and also to the fact that an average of 20 m.p.h. had to be maintained. If the trials promoters have erred, we consider that it is in setting a comparatively high average speed. Such an average is all very well on ordinary roads, but on an exceptionally hilly course such as was used for the Scottish Trials, abounding in corners that tried the rider's skill to the utmost, loose sandy surfaces, and then again boulder-strewn tracks, it must be agreed that a lower average speed is certainly desirable. In pointing out the strenuous nature of the trial, however, we are throwing into high relief the wonderful performances of those who obtained full marks. It may reasonably be argued that what one rider and one machine can do, the remainder should be able to do also. But one is inclined to overlook the personal element in these trials, which counts for a great deal. Passenger machines have fared well considering the arduous nature of the test, seven sidecars proving their ability to follow the solo mounts anywhere and keep up with them in average speed. The cycle car drivers were not so fortunate, only two being gold medal winners.

Petrol Prices and Substitutes.

OUR readers will remember that, some time ago, the Royal Automobile Club offered a large sum of money as a prize to the producer of the best substitute for petrol, such a substitute being desired on account of the inflated price of the standard fuel. It was hoped that the increased cost of petrol would be only temporary, but at present there seems to be no indication of any reduction in the near future—unless some other fuel can be produced in sufficiently large quantities to become a serious rival. It is, therefore, interesting to note that the Petrol Substitutes Joint Committee, composed of representatives from the R.A.C., the S.M.M.T., and the A.A. and M.U., has lately made some tests of a motor spirit which is produced from peat.

Valuable prizes have also been offered on the Continent with the same object in view, and we trust that the efforts which are being made will meet with success, and that quickly. The continued high price of fuel is likely to have an adverse effect upon the sale of motor cycles, for it is a most important point to the man with a shallow purse who has carefully to consider ways and means. It is probable, too, that it will interfere largely with the sale of second-hand machines, and thus again check the sale of new ones. Therefore, it is a matter into which it behoves the trade societies to enquire very thoroughly.

Benzole, of course, is now a well-tried and very satisfactory substitute, but it is not always easy to obtain, and there are some unsatisfactory brands on the market which do not give the good results obtained by the standard 90% benzole; these vary very considerably in their chemical composition and specific gravity, both important points. The price of benzole, too, is not much less than present petrol prices, and much in excess of the amount charged a few years ago.

Many of our readers successfully use mixtures of petrol and paraffin, in which the amount of paraffin may be anything from 20% to 75% of the whole. A 20% mixture will give quite easy starting, except in very cold weather, and the engine will pull well on hills—some engines pull better on this mixture than on petrol alone—but the saving in cost is slight until the mixture is at least half paraffin, when starting becomes more difficult, and it is advisable to empty the carburetter at the end of each journey and fill up with petrol only, unless the re-start can be made while the engine is still warm.

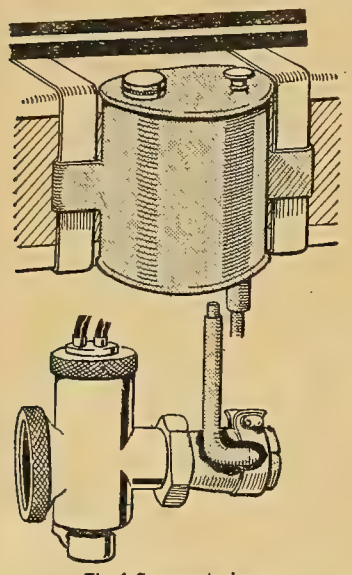
There are now upon the market several carburetters designed for use with paraffin alone, or paraffin and petrol from separate jets, mixing in the vaporising chamber, the amount of each fuel being under the control of the rider. Also, it is possible to purchase devices the object of which is to enable a start to be made on petrol only, without the trouble of emptying the float chamber of the paraffin or mixture from the main supply.

In fine, this fuel question is one of great importance, and we heartily wish success to the work of the trade and automobile societies.

AMONG THE ACCESSORIES.

The A.G. Converter.

A simple device, by means of which it is possible to run any motor cycle on paraffin has just been placed on the market, and is known as the A.G. converter. The usual petrol tank is filled with paraffin, and a small D shaped tank

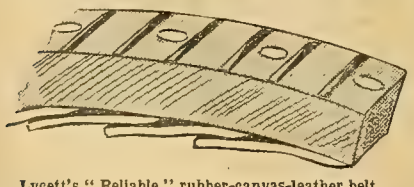


The A.G. converter in use.

is strapped to the outside. This tank contains petrol for starting purposes, and is fitted with a needle valve to regulate the supply. A short adapter is fitted between the engine and carburetter, and contains a bent tubular nozzle through which petrol and a small amount of air are allowed to pass for starting purposes, the usual carburetter forming an additional air supply. As soon as the engine has warmed up enough to enable the paraffin supply to come into action the petrol may be turned off and the heavy fuel alone used. A. Gibbs, 44, Avondale Road, Birmingham.

A Combination Rubber and Leather Belt.

Lycett's Rawido Belt Co., Bromley Street, Birmingham, have introduced a combination rubber and canvas belt called the Reliable, which is giving excellent results. The idea is that the leather tongues which are riveted separately to the rubber, slide over one another when the belt passes over the small pulley, and



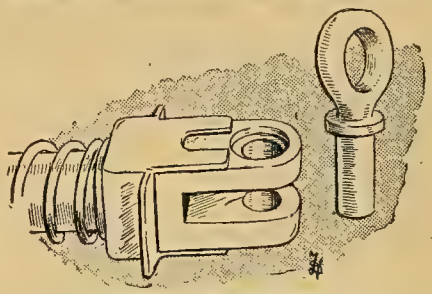
Lycett's "Reliable" rubber-canvas-leather belt.

no swelling with its consequent wear occurs at the sides of the belt. The rubber portion is shallower than the usual all rubber and canvas belt, the depth being made up by the leather tongues.

At each end of the Reliable belt are four or five fastener screws with nuts, these being in position when the belt is sent out. Drilling of holes is avoided, and a new screw is always in readiness should the old one be worn or rusty. We are informed that on a dynamometer test to destruction, this belt stood over twice as long as an ordinary rubber and canvas belt.

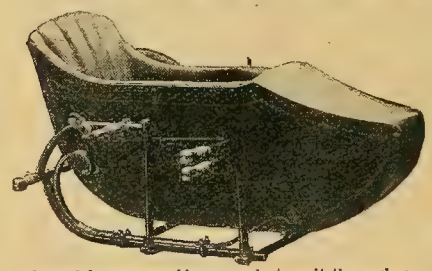
The Supreme Sidecar.

A very neat and well finished sidecar is being manufactured by the Supreme Sidecar Co. The model illustrated is specially made to suit the spring frame



The quickly detachable fittings.

Indian, and we hear that it is meeting with considerable success. The frame and fittings are all extremely soundly carried out and a quick detachable joint of a very simple and efficient type is used. This consists of a shouldered joint pin which drops into the connecting jaws



A model supreme sidecar made to suit the spring frame Indian.

and is held in position by a spring slide. To detach the sidecar it is only necessary to push back the slide and pull out the pin.

New Lodge Plugs.

Two new models of the well-known Lodge plug are now on the market. The design has undergone considerable alteration, and the insulator is now composed of unbreakable steatite welded to the central electrode and main plug body with a patent enamel on similar lines to those employed by the Mascot Co., with whom Messrs. Lodge Bros. are now amalgamated. The model C plug has several interesting features. The central electrode is constructed very heavily with the idea of conducting the heat away rapidly. The fact that the joints are perfectly gastight prevents overheating through "blow past," and owing to these features and the very short section of electrode exposed to the gases, it is claimed that the exhaust valve will cause pre-ignition before the plug.

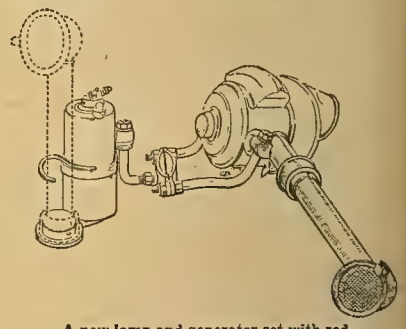
Another model is the self-cooling plug, which is manufactured on similar lines, but has a single gap, the central electrode having air-cooling ribs formed on its exposed upper end. Ribs are also turned on the body of the plug, which assist in the cooling process. It is pointed out that, though this plug is recommended for engines which work at very high temperatures, the cooling of the standard plug is good enough for practically all cases.

A new design Lodge plug has radiating fins for cooling.

Section of the new Lodge plug.

A Well-designed Rear Light Reflector.

The advantage of a tail light for night driving on any vehicle is now universally admitted, and the enormous sales of the well-known type of red reflex rear lights for cycles and motor cycles prove that the riding public are fully awake to the safety such devices afford. But such lights suffer from the disadvantage that they have to rely on the lights from an overtaking vehicle falling upon them before they give off a warning reflection, and on motor cycles, which may be ridden on a bumpy or twisty road, it is highly desirable that the rear light should be permanently burning. Evidently this feature has been appreciated by the Priory Accessories Co., Coventry, for they have just brought out an attachment fitted to a head lamp, by which this difficulty appears to have been completely overcome.



A new lamp and generator set with red warning light.

A glance at our illustration will render the nature of this attachment clear, and briefly the nature of the invention is that a tube is attached to the right-hand side of the lamp down which a ray of light is allowed to pass, and at the end of the tube is a reflector directing this ray through an ordinary red reflex type mirror. A constant light, so long as the head lamp is burning, is thus thrown to the rear, and the tube is carried far enough to the right to clear the driver. When not in use the tube is carried neatly in a special fitting attached to the generator.

OCCASIONAL COMMENTS

BY "IXION"

Waterproof Gloves.

A Canadian reader tells me that magnificent storm-proof gloves can be purchased in Winnipeg at a very low price; it is obvious that outdoor workers must require decent protection as the Canadian winter draws on, and I am sending for samples in the hopes of discovering a good line which some English maker may take up.

Toolbag Locks.

At the risk of appearing as an inveterate grumbler, I must register yet another complaint. The old strap-on toolbag has practically disappeared in favour of two small pannier bags, bolted to steel frames on the carrier, and these pannier bags are almost invariably provided with locks, as commonsense must suggest. But the locks without exaggeration represent a regular source of income for the repairer. They are extremely miniature in character, and what with the side strains imposed by the bulge of the variable size of the kit behind the flap, and the dust that infallibly enters, and the flimsy nature of the keys, and the chances of losing the keys or leaving them at home, the bags are oftener under repair than not. Can no genius invent a bag with a simple and substantial locking arrangement? The commonest trouble is the jamming of the lock by the entrance of dust. The next time a tool is wanted the key refuses to turn, and the irritated owner uses a little more wrist torque than usual, with the natural consequence that the wards of the key shear clean off. I keep four keys, and always have one in my sovereign purse, but twice this year I have had to gouge the lock off the bag with a screwdriver, because grit had jammed it, and injections of paraffin had failed to wash out the obstruction.

Mending a Leaky Float

Many readers, some of whom appear to puncture their floats at frequent intervals, have recommended the obvious tip of immersing the float in boiling water and tracking the hole by the bubbles. One writer says, with sense, that as soon as the hole has thus been traced and marked by a scratch, it will save time to enlarge the orifice and get the petrol out quickly. Another reader says that in repair work he expels most of the petrol by heat, and then applies a light to the last few spurts of escaping gas, when the flame indicates the hole to the eye, and marks it on the float by carbon stains. The boiling water dodge is obviously the best.

An Interesting Lubrication System.

I wonder how many motor cyclists are familiar with the lubrication system employed on the Connaught two-stroke motor bicycle. It is probably the simplest in the world, consisting merely of a small metal measure, holding $\frac{1}{16}$th of a pint; this measure is carried screwed to the draw-off tap of the oil tank, and one measure full of oil is mixed with each quart of the petrol used in the fuel tank. The oil is then sucked into the engine with the petrol (of course, the explosive mixture on this engine passes through the crank case). The lubrication thus bears exact relation to the petrol consumption, which is, of course, ideal. A Connaught enthusiast has been asking me why the same system is not applied to the standard four-stroke machine, as its advantages from the rider's point of view need no emphasising. The first difficulty lies in the fact that an engine provided with valves almost invariably possesses a side pocket, with shafts and bushes which require lubrication, and it is not certain

HILL CLIMBING EXTRAORDINARY. W. H. Carson, who, as we reported last week, climbed the Nailsworth Ladder on a 5-6 h.p. Excelsior and sidecar. This ascent is the first by a single-cylinder sidecar outfit and the third to date. The approximate length of the hill is said to be 300 yards, and the gradient from 1 in 4 to 1 in 2. The gear was 13 to 1.

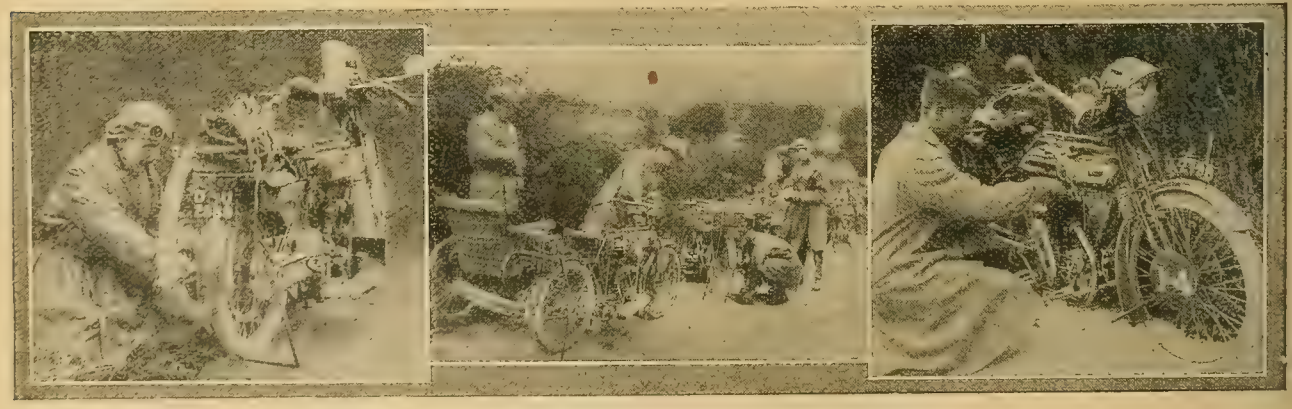
that an oil fog would wander out into a timing gear case with sufficiently dogged penetration to enter the narrow clearances between the pinion spindles and bushes (for the liquid oil, it must be remembered, is introduced by holes drilled towards the centres of the shafts). A further difficulty lies in the fact that the pressure on the bearings of a high efficiency four-stroke engine is extraordinarily heavy, and is intermittent; but in the case of a two-stroke engine the explosion stresses never touch so high a maximum, and are practically constant in character. It is, of course, possible that this simple system might be applied to a four-stroke engine, but I do not feel certain that the connecting rod and crankshaft bearings would receive an adequate supply of oil when the engine was working really hard; and I rather suspect that the timing gear case might have to be shut off from the crank case and lubricated by liquid oil, fed through a plug at its highest point. This could easily be arranged to last for very long distances if the cover were made genuinely oil-tight. If my memory is not at fault, I fancy that one of the old brigade used to feed his lubricant through the carburetter on a prehistoric Clement-Garrard of 1¼ h.p. If he did, the experiment does not afford sufficient data for dogmatising about the modern ultra-efficient 500 c.c. engine. It would be interesting to hear from any practical engineer who has made experiments with the system, and from any theorist who perceives possibilities or impossibilities in it. Personally, I do not believe that this or any other modification of the present system can long delay the universal adoption of mechanical oiling. Will any Connaught users tell us whether the system makes it necessary to clean out the carburetter oftener than is customary with ordinary machines?

Starting T.T. Models.

Yet once again have I taken delivery of a T.T. model which is frightfully difficult to start. The difficulty depends on two factors: the first is the tightness of a new engine in all its parts—this will disappear as the engine gets run in—and the other is the carburetter adjustment, which is planned to supply a perfect mixture at high speeds, whereas the touring carburetters are adjusted on a system of compromise.

It is real work to get it going. My complaint is to the effect that a simple shutter on the main air supply would render this machine as docile in starting as any touring model; such a shutter could be operated by a small knob on the carburetter itself, and would not increase the manufacturing cost by sixpence.

Every racing carburetter should possess one of these simple fitments; in fact, while there are always novices with us, I regard shutters as rather desirable adjuncts to the standard touring carburetter. They make it possible to start a very gummy engine at the first push, and cancel the handicap of air leaks.



EFFECTING ADJUSTMENTS WHILE WAITING OUTSIDE A CONTROL.

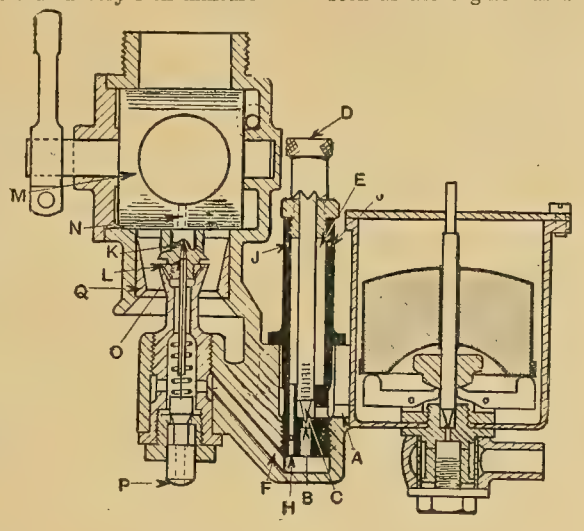
A STUDY IN CARBURETTER DESIGN.

Three New Carburetters possessing Automatic Air Supply.

THE LATEST LONGUEMARE WITH VARIABLE JET.

As we mentioned in our report, the winner of the 350 c.c. class in the Grand Prix, G. Fenton (Clement), used one of the new automatic Longuemare carburetters, with adjustable jet opening. We have obtained a sketch and particulars of this device from Messrs. E. J. Hardy and Co., Queen Victoria Road, Coventry, who are the sole agents in this country. The first Frenchman to complete the course in the 500 c.c. class, Perrin (Peugeot), also used one of these devices. The carburetter is an adaptation for motor cycle use of the F. B. Longuemare car carburetter.

The carburetter is so constructed that a very rich mixture is given automatically every time when the engine is doing real hard work, such as accelerating or pulling slowly uphill. When running at high speed the mixture automatically becomes of a lighter nature, and the carburetter is therefore highly economical. This result is obtained by a reserve chamber which automatically fills and empties itself of petrol under the varying conditions. The details will be followed by referring to the annexed drawing.



The float chamber, which is of the ordinary toggle lever pattern, connects to the reserve chamber by the canal A, and the spirit flows from the bottom of the reserve chamber through the canal B. The amount of petrol which passes through B is regulated by the needle valve C, which can be adjusted by the milled thumbscrew D, and this adjustment can be altered by the rider from the saddle. The reserve chamber E is connected with the bottom canal F by a small diameter passage H. The petrol thus flows from the float chamber through A and B into F and rises in the reserve chamber through H, the displaced air in the reserve chamber passing through the small port J.

In the vaporising chamber there is a pilot jet K and a series of jets L. The jets L are somewhat similar to the old type Longuemare carburetter so familiar to old motor cyclists, except that they are of larger diameter than is really necessary, and will thus pass whatever amount of petrol flows past the regulating needle D. The throttle is of the barrel type, and when in the closed position as shown, a small hole N is situated exactly over the pilot jet K.

When the engine is started up the throttle should be in the closed position, and the engine will revolve very slowly upon the petrol drawn solely from the pilot jet. When running slowly, less petrol is required than will be supplied by the passage B, consequently the petrol in the reserve chamber is not touched. Immediately, however, that the throttle is opened, the ordinary jets L will come into action and the engine will then require more petrol than will pass through the canal B. It consequently begins to draw on the reserve through the passage H, and from there it obtains the rich mixture which is necessary for quick acceleration. As soon as the engine has accelerated, the reserve chamber will become exhausted, and then air will commence to flow through the port J into the reserve chamber, and from there through the passage H into the canal F. In this manner the petrol is aerated before it reaches the vaporising chamber, and consequently a very economical mixture is produced for high speeds. This continues so long as the high speed is maintained. As soon, however, as a hill is encountered and the engine revolutions decrease, then automatically the reserve will fill up, and the supply of air from the reserve chamber will cease, and once more a richer mixture is produced suitable for the harder work. An ingenious device is fitted to overcome any stoppage in the pilot jet. A very fine wire O runs through the centre of the pilot jet, and should any obstruction take place, owing to dirt, all that is necessary is to press the spring plunger P, when the pilot jet will be automatically cleaned. A choke tube Q is fitted round the jets and varying sizes of choke tubes are supplied, so that the best adjustment to suit various sized engines may be obtained. The throttle is actuated by a small lever which can be connected by a Bowden wire to the usual handle-bar control, being returned to its closed position by a spring.

Greame Fenton, after the race, said that his success was largely due to the Longuemare carburetter, which enabled him to get a rich mixture for starting from cold in the chilly early morning, and this was demonstrated by the manner he obtained a substantial lead in the early portion of the race.

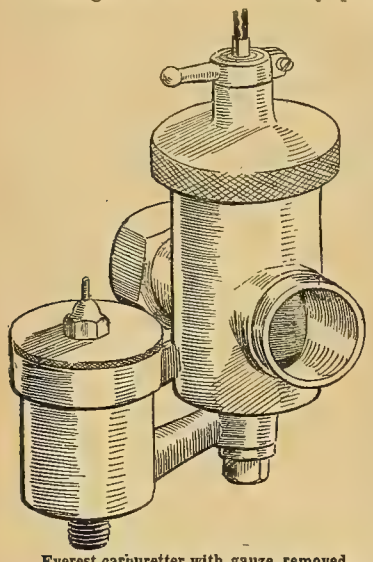
THE EVEREST AUTOMATIC CARBURETTER.

WHEN dealing with the various machines entered for the Scottish Six Days' Trials, we mentioned the fact that one of the Lea-Francis machines was fitted with a new automatic carburetter. By permission of Mr. Everest, of the Maudslay Motor Co., we are now able to describe and illustrate the device which, as before stated, is a modification of the carburetter used with great success on Maudslay cars. The petrol enters through a float chamber of the usual type which calls for no special comment. It is then led to the base of a tall vertical jet member A, which is drilled with a number of horizontal jets to suit the requirements of the engine. This jet member has a flat on either side, and is covered by a saddle piece B, having a spring section C let in on the flat opposite to that on which the jets are drilled, which holds the saddle up to its work and prevents leakage from the jets still covered. The petrol level is slightly below the lowest jet, so that no liquid can flow over. The saddle piece is capable of being raised by means of a Bowden wire, and is cast with two projecting arms D, one of which is clearly visible in our illustration. These arms engage with the under-side of a ring cast in the throttle barrel E, and thus the throttle is raised with the saddle piece, both being returned to the shut position by the spring.

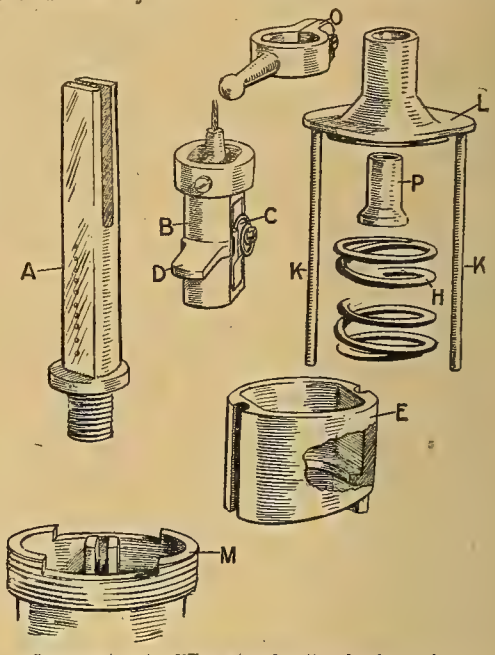
The Method of Working.

The principle on which the carburetter works may now easily be followed, for it will be seen that when the saddle-piece is raised a jet is uncovered and the throttle and air partly opened by the same movement. As the throttle is further opened more jets are uncovered and more air allowed to pass, thus by spacing and proportioning the jets correctly a steady flow of correctly proportioned mixture is obtained at all speeds. For obtaining the correct air supply a very simple and accessible device has been introduced. It will be seen that two grooves are cut in the outer

periphery of the throttle barrel E; into these grooves fit the two prongs K of the flange-shaped top L. The arms of this flange lie in the cut away portions of the top of the carburetter body M, and by means of the lever O may be partially rotated, thus altering the position of the lower profiled face of E in relation to the main air orifice. If a specially strong mixture be desired the throttle barrel may be reversed, thus bringing the profiled face opposite the gas outlet port and the plain face opposite the air inlet. The nipple P fits over the top of the jet member and forms the take-off for the Bowden cable. All parts of the carburetter are very accessible and simple, and, if necessary, can be handled and cleaned by the merest novice. A pilot jet, having an outlet above the saddle piece and being cut out of action as soon as the main jets come into play, is a refinement which will be fitted to future models. The nipple P and the flange top L are both formed with conical faces, which effectually prevent air leakages, and a special inlet pipe fixing will be supplied to prevent leakage at the carburetter joint.



Everest carburetter with gauze removed, showing profiled back of throttle barrel by means of which the air adjustment is obtained.

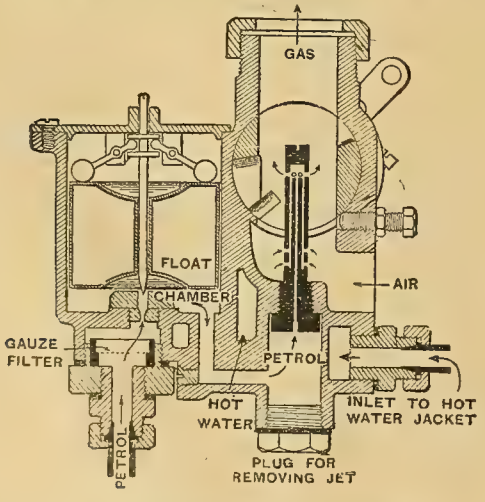


Component parts of Everest carburetter showing curious arrangement of jets.

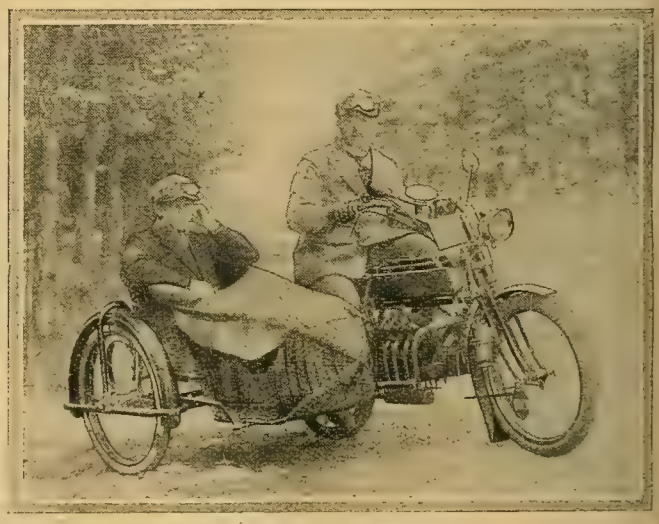
THE CLAUDEL AUTOMATIC CARBURETTER.

PROBABLY no man has devoted so much time and attention, with such marked success resulting from his efforts, to the question of carburation as M. Claudel. His status in the carburetter world is shown by the fact that out of the twenty starters for the recent car Grand Prix all the French and English cars were fitted with this firm's device for their gas supply, and for two years in succession the winners of this race have successfully relied on M. Claudel in this department. Fuel economy, combined with power, is the ideal in carburation, and, at all events, in fitting his instruments to cars, the inventor has abundantly proved that he can reach the ideal indicated. Now a new model carburetter by M. Claudel is being put on the market specially designed for motor cycles and cycle cars. This is marketed in three types for different sized engines. It is automatic in its action, and is entirely devoid of any devices or complications for adding extra air at high speeds, or to give alterations to the jet. A feature of the carburetter is the provision of a hot water warming jacket, which can be used when fitted to a water-cooled engine. The water can be turned on and off by a tap as the temperature demands.

A glance at our sketch reveals very clearly the general principles of this carburetter, which approaches very nearly to the ideal of simplicity, a jet in a tube. This carburetter is claimed to be so automatic in its action that it is quite independent of barometric differences, because the whole action of the carburetter is governed by the amount of air entering, and the amount of air which can enter is governed by the requirements of the motor at the moment of admission. Therefore, it is impossible to upset the mixture by the admission of two much or too little air. This carburetter is sold by H. M. Hobson, Ltd., 29, Vauxhall Bridge Road, London, S.W.



The Claudel motor cycle and cycle car carburetter.



THE SIDECAR IN BELGIUM.

Scottish Six Days Reliability Trials

A description and photographs of the first day's run appeared in our last issue. (See pages 965-8).

SECOND DAY.—Inverness, Dingwall, Bonar Bridge, Lairg, Tongue, Bettyhill, Thurso. 140 miles.

Everyone was glad of the late start this morning from Inverness, and at 9.30 in beautiful weather the first man was sent off. After the rough going yesterday, which Sam Wright described as the worst for passenger vehicles he had ever experienced in any trial, it was delightful to bowl along over almost perfect roads for the first forty miles to Bonar Bridge. Very pot-holey surface followed to Lairg, where the lunch control was situated. All fittings and accessories are being put to a tremendous test by the road shocks, but, despite the hardness of the trial up to the present, everyone agrees that it is most sporting, and the officials manage everything splendidly.

Although the morning's run was quite uneventful, and, in fact, just a pleasant trip over sixty miles of perfect roads, everyone had a rude shock when a move was made after lunch towards Thurso, some eighty miles distant. The easy nature of the morning's run, combined with the lovely weather, had raised the riders' spirits after the almost indescribable nightmare of the first day's run. But in some ways this afternoon's run has proved even worse than yesterday's, and a formidable list of casualties has been the result of a passage over roads so bad that it was a real physical strain to sit one's machine at all. All who arrived at Thurso were dead tired, and a good deal of grumbling was heard among the English entrants at being asked to take their machines over such villainous surfaces as we have had to traverse this afternoon. All the same, the contention of the officials, that a machine that will not stand this treatment is no good for Scotland, has a lot of reason behind it, and the jolly sporting go-as-you-please nature of these trials almost makes a pleasure of the toil.

Almost immediately after leaving Lairg we found ourselves literally pitching and rolling on a horrible loose stony track, which continued, partly bad, partly execrable, to within fourteen miles of Thurso, where we were treated to a perfectly straight level road, upon which a miniature T.T. was straightway held, everyone being delighted to be able to open the throttle and let the motor roar for a short burst.

F. L. Bassett (2¾ h.p. Sun-Villiers). Observe the method of carrying a spare tyre. Several competitors deemed it necessary to carry spare covers during the trials.

No one who went over it will readily forget the horrors of the switchback road from Lairg to Altnaharra. Great flinty boulders strewed the path, and every now and then we struck a piece of road under repair, which meant perhaps 300 to 400 yards over huge unrolled granite, the worst feature being that the repaired surface was always at least eight or ten inches above the rest of the roadway. One simply had to charge the obstruction, grip the bars fiercely, and crash over the obstruction in a series of terrific wobbles, amid the cheers of the road-menders.

Lots of falls naturally occurred, and some of them were serious. G. A. Lovegrove, on a Raglan, had a bad toss and was discovered by an official in a dazed condition. It is believed that he has broken a rib, but details are meagre at the time of writing. His smash occurred near Altnaharra. Hands broke the frame of the sidecar on his Williamson and had to take his passenger into Thurso, some twenty miles, on the carrier of his machine, but he told us at dinner he intends to continue solo if the judges will allow him to do so. Ingall riding a Lea-Francis suffered a bad fall. His front wheel got into a deep rut on the road near Borgie after leaving the Tongue check, and he was thrown heavily, damaging his knee, and had to be brought in on the official car. Edmond, on the 2¾ Humber, broke his spring forks on one of the ridges where road repairing was going on near Bettyhill, and Cyril Walden had to be towed in, as the flywheels of his twin Premier came adrift. Pollock, driving a 600 c.c. single-cylinder James and sidecar, was put out of action between Altnaharra and Tongue. An eye witness told us that his tyre burst and the driving wheel collapsed, while the steering gear on the Summers and Harding cycle car snapped, and the vehicle ran into the ditch and was disabled. Early in the

LEA FRANCIS TEAM.—C. H. Ingall, N. W. Downie, and G. I. Francis.

MATCHLESS TEAM.—R. E. Guest (8 h.p. and sidecar), J. A. Hoult (3½ h.p. twin), and C. R. Collier (8 h.p. and sidecar.)

Great interest has been taken in the trial all along the route. Our photographs show how competitors have had to ride through lines of spectators in many of the large towns.

day a curious accident occurred as Westwood and Meredith, riding Nos. 1 and 2, on a Triumph and Bradbury respectively, collided through their front wheels getting into ruts, and Westwood had to retire owing to his front wheel being smashed. It is also said that the back wheel of Bell's A.J.S. collapsed on the first day at Amulree, causing his retirement. We have just been informed by Hands that the judges have refused to allow him to continue solo on the Williamson, so he is getting the village blacksmith to see if he can brace up the broken sidecar frame in order to keep going.

The Unseen Scenery.

There is little doubt that the roads we have covered up to date are not a fair test for motor cycles unless ridden at an average speed of under 20 m.p.h. The writer got his Matchless through all safely, except that the front fork spring suffered, and the clutch on the hub gear gave out. But we can certainly say from our own experience that the strain of driving is terrible when one has to grip the bars tightly for hour after hour on end, and keep one's eyes glued to the road the whole time. We are informed that we passed through scenery of unparalleled splendour, but no one had the remotest chance of seeing it. The only view was millions of loose stones on a rutty potholey road.

C. R. Collier stated very definitely tonight that he would absolutely refuse to ride again in these trials unless better roads were selected. The gradients to-day were contemptible, but we would rather go on climbing Porlock all day than bounce and ricochet over the abominations miscalled roads we have been over during the last forty-eight hours.

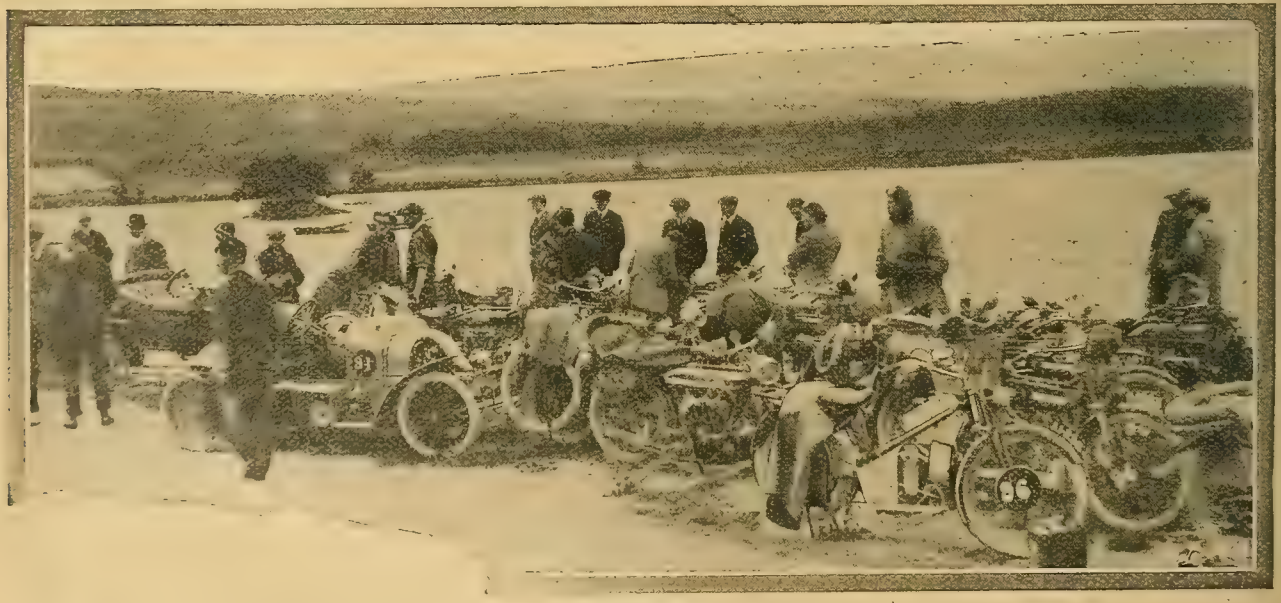
The Lady Riders.

The ladies acquitted themselves splendidly, though the strain of driving must have been very severe. Miss Hammett (Douglas) has shown herself to be a most dashing rider, while Mrs. Hardee (P. and M.) and Mrs. Baxter (Rex) keep slogging along in a most determined manner. Just after passing Tongue this afternoon we came suddenly upon a very sharp hairpin on quite a respectable gradient, so acute, in fact, that several riders missed the turn, but Mrs. Baxter made a particularly good climb, although her heavy machine with open frame cannot be an easy handful for a lady to manage as a solo mount.

Not so good as Whiskey.

The dust has been appalling, and we, in company with many others, have suffered from throat soreness from hours of swallowing bits of pulverised granite—not a pleasant beverage.

The officials are a cheery lot, and give us all the help they can, and profess to pooh-pooh the difficulties of the road, but the mere list of casualties show that this trial is something far in excess of English Six Days so far as difficulties are concerned.



Picturesque scene at the luncheon stop at Lairg.

C. M. Keiller (G.W.K.) overtaking one of "The Motor Cycle" representatives during the long ascent of Applegill Hill.

One thing stands out prominently; that is, that anyone who gets a machine through at all has performed a very fine feat, and any manufacturer who can put a successful team through this test is a constructor of great merit, and fully deserves every bit of prestige with which such a performance invests him, and Southerners must cover these roads themselves at an average of twenty miles an hour to form an adequate idea of their severity.

The following retired on the second day: Ingall (Lea-Francis), C. H. Walden (Premier), W. H. Hands (Williamson), Thompson (Kynoch), Pollock (James), Edmond (2¾ h.p. Humber), and Lovegrove (Raglan).

The following lost marks: G. I. Francis (Lea-Francis), Mellor Jameson (3 h.p. Enfield), Tom Knowles (3½ Humber), Selous-Jones (Douglas), and G. C. Proctor. Laker (3¾ h.p. Elswick) and Busby (Ariel) returned no cards.

THIRD DAY.—Thurso, John-o'-Groat's, Wick, Berriedale, Helmsdale, Lairg. Bonar Bridge, Dingwall, Strathpeffer. 146 miles.

An absolutely perfect summer morning, developing into a blazing day, perfect roads and gorgeous scenery, has been our lot to-day. If yesterday was a nightmare, to-day has been a dream, for anything more magnificent than our trip could not be imagined. The scenery beggars description, and the southerners discovered that Scotland *has* roads, a belief that was almost shattered yesterday. At 8.30 we drew out of the little northern town Thurso, and sped along to John-o'Groat's, where there was a check and a fifteen minutes' halt, and then on by the coast road over part of the familiar End-to-end road. Despite the perfect going trouble was encountered quite early, for we passed F. L. Bassett (2¾ Sun-Villiers) stranded. His flywheels, it seemed, had come right adrift five miles north of Wick, while at Helmsdale, Downie (Lea-Francis) suffered engine trouble and had to withdraw. Mention of this make reminds us that Ingall left by train for the south from Thurso this morning, looking very shaky after his heavy fall yesterday. His Lea-Francis was in perfect running order, as we had ocular demonstration. It is a pity that these interesting machines have had such bad luck, but yesterday's run subjected every machine, and every rider as well, to a terriffic bucketing. It now transpires that Lovegrove, who was thrown heavily yesterday from his Raglan, has not broken a rib, but his side is very badly bruised.

Berriedale Easily Ascended.

Berriedale was taken from the easy side and everyone roared up—the surface being excellent. In fact, the going all the way through Brora, Golspie, and on to lunch at Lairg, where we stopped yesterday for the same purpose, was perfect, and everyone thoroughly enjoyed scorching along at high speed. The dust was a nuisance, but no one minded that—the relief of being able to travel without clutching one's bars was worth a Sahara sandstorm. There was not a hill on the course to-day worth noting, Dunbeath being the worst, as it contained a bad corner with a sharp right bend, and here we watched the cornering methods of some of the riders. Some came round quite easily without effort, others scraped round, while a few nearly "conked" to a standstill. The following solo riders all made good climbs, Meredith (Bradbury), Harrison (Swift), Downie (6 A.J.S.), Fletcher (Douglas), Tessier (5-6 Bat), Featherstonhaugh (Rover), Colliver (7 Indian), Newsome (Rover), Chisholm (Ariel), Mrs. Baxter (6 Rex), McCreadie (Sunbeam), Hugh Gibson (Bradbury sc.), and two Chater-Lea riders.

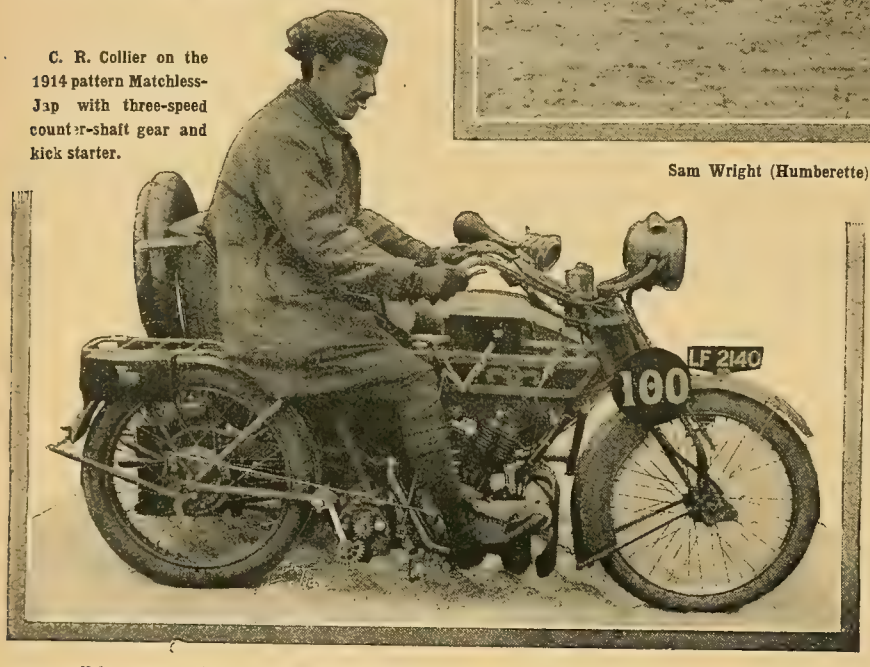
Punctures and bursts have been almost universal. Mellor Jameson (3 Enfield) had two stops this morning, and the

A. B. Wade (8 h.p. New Imperial sidecar) climbing Applegill Hill.

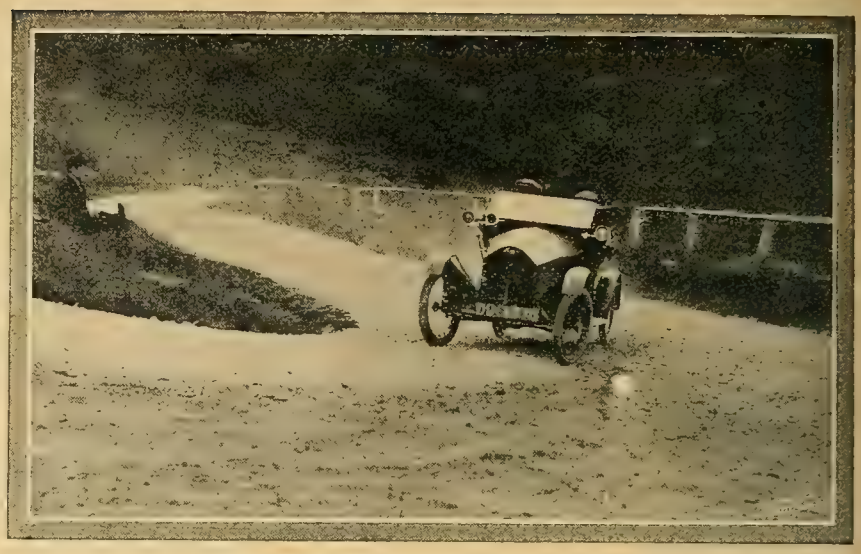
second time found four punctures in a cluster near the valve, and had to ride two miles on the rim before he reached water in which to test his tube, whil Keiller wrenched one of the tyres off his G.W.K. on Dunbeath Hill, and after replacing it got a puncture. It is really a great testimony to the excellence of the tyres that they have stood up as well as they have done, but we have not been much struck by the behaviour of the ultra-large covers, for they seem prone to roll and bounce excessively on the rough roads.

Flints and Punctures.

The main North Road from John-o'-Groat's, while being of infinitely superior surface to any yet covered, was particularly flinty, this sharp material being



C. R. Collier on the 1914 pattern Matchless-Jap with three-speed counter-shaft gear and kick starter.



Sam Wright (Humberette) rounding the Devil's Elbow.

responsible for most of the trouble. Probably the unluckiest rider in this respect was Graham Taylor (3½ h.p. Rudge), who had no less than five punctures. These occurred, however, in the long checks, and he was able to repair and maintain his schedule. Shortly after leaving Thurso we passed D. H. Noble (Rover), who was troubled with his plug. This did not, however, cause him much delay, as he passed us later, travelling at a good speed.

Clouds of Dust.

The majority arrived at John-o'-Groat's well ahead of time, and seized the opportunity of doing a few adjustments. Hal Harrison (Swift) punctured when near the control, but arrived to time. J. H. Begg (3½ h.p. Rudge) was rather unfortunate, taking an awkward toss near John-o'-Groat's. The only member of the Downie family to escape trouble was A. U. R., his two brothers both being delayed—N. W., as previously mentioned, with engine trouble, and A. F. with two punctures.

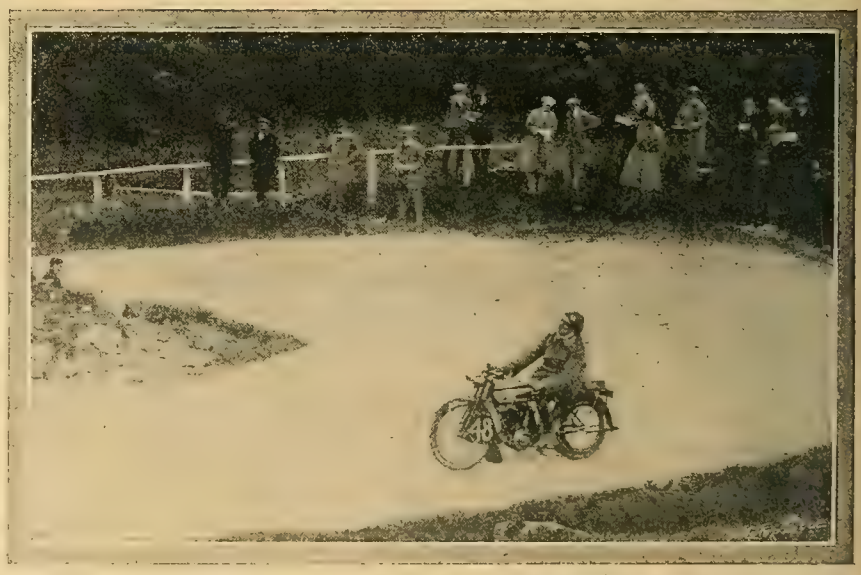
Near Dingwall this evening we came across about three hundred yards of road some four inches deep in loose floury dust, and front wheel skids were common, while the whole countryside was obscured by a dense cloud, and to make matters worse a car dashed by at the same moment.

The smaller machines are doing splendidly, and the Gnome-like beat of the Douglases when all out on low gear seems to impress the natives. The energy and courtesy of the officials cannot be too highly praised, and there is a feeling and spirit of *bon camaraderie* between competitors and officials that makes these trials a jolly trip, in spite of the hard work incurred.

The following have retired to-day: N. W. Downie (Lea-Francis), E. L. Bassett (Sun-Villiers), J. F. Selous Jones (Douglas), and S. Tubb (3½ Humber).

The following have lost marks: J. Cocker (3½ Singer), G. A. Gregson (5-6 Bat), B. Alan Hill (7 Indian), H. Mellor Jameson (3 Enfield), and P. D. Walker (10 Summers and Harding c.c.).

Seventy-six riders are still left in.



George Brough (6 h.p. Brough) on the Devil's Elbow. The performance of George Brough riding a single-geared machine on some of the steepest hills in the Scottish Trials has proved an eye-opener to many. He is seen above on the second bend of the Devil's Elbow.

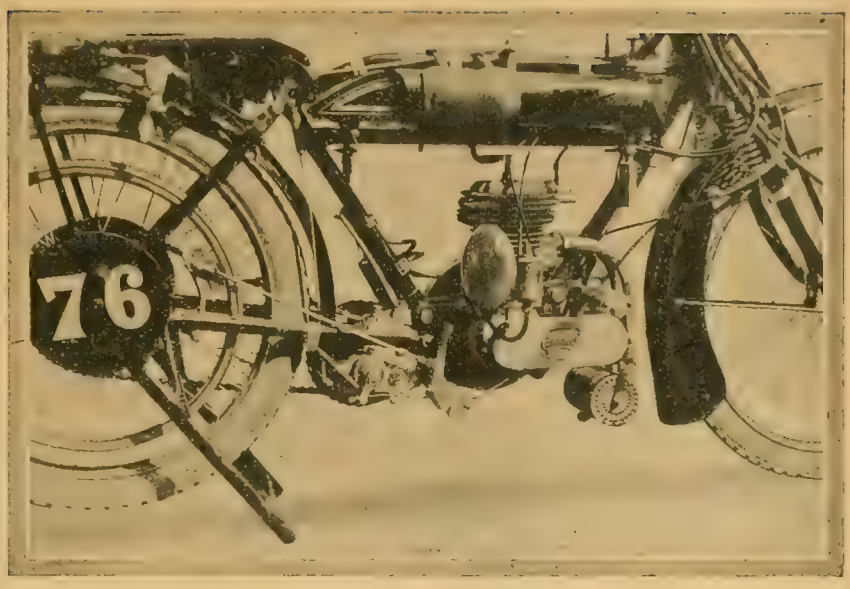
FOURTH DAY.—Strathpeffer, Kinlochewe. Achnashellach, Lochcarron, Tornapress, Applecross, Tornapress, Lochcarron, Achnasheen, Garve, Strathpeffer. 137 miles.

Perfectly magnificent weather has been our lot to-day; in fact, it has been one of the hottest days we have had this year. A great many competitors had got in last night with their tyres in a more or less precarious condition, and there was a regular tyre-changing competition against time in the official garage before to-day's start. Sidecar drivers suffered most, and one of the first we saw was Guest inserting a new tube in his three-inch Palmer cord on the Matchless sidecar. He got a huge nail like a bolt through yesterday, and had a good deal of difficulty in getting it out, and evidently he was not satisfied with his repair of yesterday, as he put in a new tube this morning. Selous Jones turned up on his Douglas, but he was officially declared out of the running yesterday, as he broke a cone in his back wheel—a most unusual and unlikely accident to any machine. G. Taylor and J. G. Beveridge, both on 3½ Rudge-multis fitted new back covers, and G. T. Gray put a new belt on his long stroke 5 Rudge. He explained to us that he was running in three or four belts in readiness for the English Six Days' Trials next month.

The Ladies Assist.

Mrs. Morgan and Mrs. J. R. Alexander were both working as hard as Grand Prix mechanics, assisting their respective drivers to change the big three-inch tyres on the back wheels of their Morgan and Williamson sidecar respectively, and the cheery way the ladies accept and help to overcome troubles makes us mere men feel rather small. We confess we do not like the trouble of even shortening a belt, but taking out back wheels from chain-driven machines seems quite a little morning diversion to some of the fair sex taking part in the trials.

A good many engines are very gummy in the mornings, probably due to over-oiling. Brough's single gear 6 Brough



NEW MACHINES IN THE SCOTTISH TRIALS.
The two-stroke Connaught engine, also showing new carburetter and G. H. gear with chain drive.

is really a remarkable machine. It starts with almost the ease of a lightweight, and nothing in the way of hills seems to worry it o rthe driver. Sam Wright's Humberette has run very well up to half-way, and so far neither he nor the two G.W.K.'s driven by Keiller and Wood have lost any marks. The two Morgans have clean sheets up to half-way, except that one of Blackburn's checking cards is said to be incomplete for Monday's run. The cycle cars, therefore, have done extremely well so far, and although it lost forty-four marks up to Wednesday night, the Summers and Harding cycle car is still getting along gamely. The Gordon cycle car, except for an incomplete checking card, has lost no marks up to half-time. By the way, this machine turned up and started with trade numbers, but has since attached private registration numbers as well. It is a curious looking machine, but we can personally testify as to its speed, for we followed it for some miles over a horrible road on Tuesday, and rather envied the occupants, for it seemed to hold the road well.

A Curious Experience.

H. Thompson has turned up to-day with his 3½ h.p. Kynoch, and a remarkable tale to tell. It seems that by some means part of a tappet got into his engine, and he had to take the whole engine to pieces outside Thurso, miles from anywhere. He spent all yesterday doing this, and eventually slept on the mountain side, where he was eventually discovered by a local doctor, who is a motor cyclist, and who took in the unfortunate Thompson, repaired his engine, and generally played the part of good Samaritan. One of the things that

TWO VIEWS OF THE SAME BEND AT THE MOST NORTH-WESTERLY POINT OF THE TRIAL.
R. S. Morrison (Bat sidecar) on the hairpin outside Tongue. Douglas, A.J.S., and Lea Francis riders on the same corner.

Scottish Six Days' Trials.—

strike one most forcibly is the extreme kindliness and hospitality of these northern Scots, nothing being too much trouble for them when the recipient of their kindness is some unfortunate stranded motor cyclist. One sportsman has hired a car specially to start after the last competitor and drive round with the sole intention of rendering assistance to any stranded victim of the Trials he may come across. He brought in Nott to-day after his collision with a level crossing gate to which we refer later on.

Fine Scenery.

From the scenic standpoint nothing could be finer than that of to-day, and the majority of the competitors wished that they had had more time to study the beauties of the Western Highlands. Twenty miles per hour does not appear a great speed, but to average this over the roads of to-day's route required careful driving on the corners and very fast scorching on the favourable stretches. Up to the first check at Achnasheen the surface was fairly good, although loose in places. Thereafter it deteriorated very much, and up the hill to Applecross it was frightful, large stones and loose gravel causing the competitors a great deal of uneasiness, and rendering the steering of the machines a matter of great difficulty.

The easy nature of the road to Achnasheen is easily estimated from the fact that all the riders arrived here with plenty of time to spare, and employed this in making adjustments to their mounts. One or two suffered from tyre trouble, and we passed A. F. Downie (6 h.p. A.J.S.) with his back tyre off. After having twice had tyre troubles yesterday it was rather hard luck to have to repair immediately after the start to-day. T. A. McCreadie (2¾ Sunbeam) was even more unfortunate, getting into a rut and coming a nasty cropper, and buckling his front wheel and frame. He luckily was able to get this repaired at a blacksmith's near at hand, and resumed his journey, only to meet with further trouble later. The tumble had evidently cracked his handlebar, since he had not proceeded very far before that part of the bar containing the control levers came adrift entirely, making the driving of the machine anything but an easy matter, and he wisely decided to retire.

Applecross Climb.

Discussion amongst the riders, of course, centred in the ascent of Applecross, and at the various checks before this point the talk was entirely on this new introduction in the way of hills. Leaving Jeantown, the road strikes due west over the hills, after which there is a long descent into Tornapress, whence the dreaded ascent begins. At first this appeared not appreciably steep, but gradually winding round the hillside, the road can be seen disappearing in the distance between two precipitous crags. It is at this point that the various hairpin bends occur, and coming as they do after the long climb, the engines are very much inclined to conk badly.

The most difficult bend to negotiate was the first, and many of the cycle cars had to reverse to get round. We observed most of the competitors here, and, although the majority got round, a great many nearly came to grief. The sidecars being, of course, on three wheels had an advantage over the single trackers, and, using low gear, made quite good performances. Special mention must be made of Hugh Gibson and his 3½ h.p. Bradbury sidecar, the manner in which he came up to the bend and got round exciting the applause of the few observers. Unlike what might be expected of a single-cylinder with sidecar attached, this combination possesses a very fine turn of speed, and climbed the long gradient to the bend at an excellent pace. G. L. Fletcher (2¾ h.p. Douglas) got round beautifully, picking up the whole way. Mrs. Baxter was unlucky, coming to grief. She, however, restarted and got away well. C. M. Keiller (G.W.K.) reversed into the corner, but started quite easily. J. F. Morrison (2¾ h.p. Douglas) failed, as also did J. H. Begg (3½ h.p. Rudge-multi), who cannot obtain a low enough gear for corner work. W. B. Gibb (2¾ h.p. Douglas) was in trouble all day with his ignition, and stopped on the hill, getting away after some delay. C. R. Collier (8 h.p. Matchless sc.) seemed to have a great reserve of power, since after rounding the bend he went away at a fine pace.

Good Ascents.

The following were all good: S. J. K. Thomson (7-8 Bat sc.), J. Chater-Lea (8 Chater-Lea sc.), A. U. R. Downie (2¾ A.J.S.), Rev. R. M. Banks-Jones (P and M), G. Brough (6 Brough), F. C. North (Ariel), B. A. Hill (7 Indian), Mrs. Hardee (P and M), J. B. Roberston (Douglas), G. T. Gray (5 Rudge), H. F. S. Morgan (Morgan cycle car), and Miss Hammett (Douglas). P. D. Walker (Summers and Harding cycle car) took the bend too close in and charged the bank, buckling his front wheel and finishing his chances. Although officially retired, Lionel Martin (Singer cycle car) is still taking a keen interest in the event. The splendid hill-climbing ability of his little car was well tested.

Accidents.

G. Nott (6 h.p. Clyno sc.) was unfortunate enough to run into a level-crossing shortly after the start, where the road takes a complete S bend across the rails. It would have been advisable had the committee placed a warning sign at this point, since there appeared to be only the ordinary warning triangle erected.

D. S. Alexander (8 h.p. Williamson sc.) nearly ran into the closed gates of this same crossing, only pulling up with his front wheel touching the bars.

Graham Taylor fell over the edge of the precipice coming down Applecross and damaged his front wheel.

Lunch was served on the seashore at Applecross in blazing sunshine, and a large number of riders spent half an hour paddling and catching limpets while their engines cooled themselves preparatory to the return climb. The run back was uneventful, but everyone was behind time more or less. And for once in a way the whole crowd was unanimous on one point—they had come across a *real* hill that afternoon. Applecross is more than a hill—it is a precipice.

The following retired to-day: T. A. M'Creadie (Sunbeam), G. A. Gregson (5-6 Bat), J. D. Beveridge (3½ Rudge), G. Nott (6 Clyno sc.), G. Taylor (3½ Rudge), T. Finlay (4 James sc.), and P. D. Walker (Summers and Harding c.c.).

The following lost marks: W. B. Gibb (Douglas), T. T. Laker (3½ Elswick), J. R. Blackburn (8 Morgan), D. Alexander (8 Williamson sc.), T. Heath (6 Clyno), J. Steel (3½ B.S.A.), Miss Hammett (2¾ Douglas), C. R. Collier (6 Matchless sc.), and T. Knowles (2¾ Humber).

Sixty-nine runners were left in to start on Friday morning.

V. Busby (3½ h.p. Ariel) climbing the Devil's Elbow.

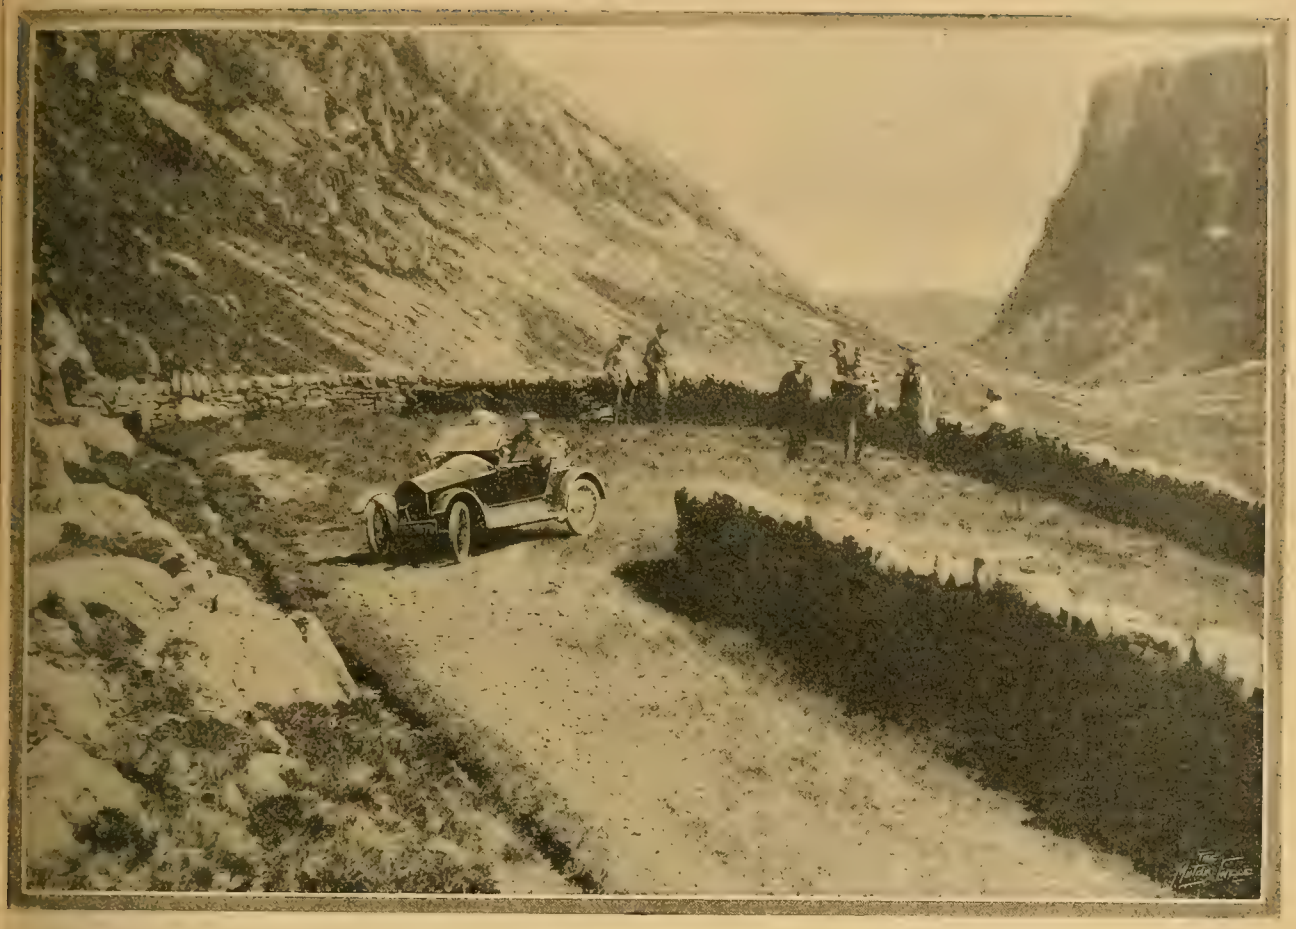
BARGAINS FOR MOTOR CYCLISTS.

THE 'J.P.' 3,000 MILE MOTOR CYCLE COVER.

'The Cover that HAS stood the test.'

Sizes Stocked.—26in. by 2in., 26in. by 2¼in., 26in. by 2½in. **Beaded Edge Only.** This Cover is made on the same principle as a heavy Motor Car Tyre, viz., under hydraulic pressure and not as the usual Motor Cycle Covers which are usually a glorified cycle tyre. It is composed of the best Para Rubber, and fitted with a new Non-skid Tread which has been thoroughly tested and found to be an absolute preventive of skidding. **We are so confident of the wearing properties of this tyre that we are guaranteeing it for 3,000 miles. John Piggott's Special Price 30/-** Write for Free Section.



Sam Wright (8 h.p. Humberette) rounding the hairpin on Applecross Hill, which ascent was considered to be the worst in the trial, being six to seven miles long.

FIFTH DAY.—Strathpeffer, Beauly, Drumnadrochit, Invermorriston, Cluanie, Sheil Inn, Glenelg, Cluanie, Tomdoun, Fort Augustus, Craggie Inn, Carr Bridge, Grantown, 199 miles approximately.

We are now nearly at the end of our journey, for to-morrow night will see the survivors in Edinburgh. The start this morning was an early one—seven o'clock—in view of the long distance to be covered from Strathpeffer to the Western Highlands, and thence back again to Grantown, only about thirty miles as the crow flies from the morning's starting place. For the first time this week we thought the weather was going to fail us, for the morning was dull and cold, but about ten o'clock the sun broke through, and afterwards it was a day of blazing heat and the usual smothering dust, which is very gritty up here, and highly irritating to the throat.

The crux of the day was the passage of a very sharp hill called Mam Ratachan, a few miles before Glenelg, the luncheon stop. The contour gives it as 1 in 7, but that is apparently the average gradient, and it is a real little teaser with a bit of something very near 1 in 3. Mellor Jameson had some sprinting exercise with his little Enfield, but, generally speaking, there were few who experienced any difficulty. C. R. Collier made a splendid ascent on his 6 Matchless sidecar, and so did Hugh Gibson (3½ Bradbury sc.). If we were asked to pick out any one performer in the Trials deserving of special merit we should select this rider. His hill-climbing powers are really extraordinary, and up to the time of writing he has made a clean ascent of every hill and lost no marks. His sidecar is quite a heavy substantially built one, and his passenger by no means light.

His climb up the long, tiring Glendoe, with its miles of collar work and tricky, unexpected little stiff incline right at the end, was really amazing. He tells us he has only used his first speed, 13½ to 1, on two occasions—once on Amulree and once on Applecross. There has been a great deal of grief and woe to-day, and as we are writing this, late at night, stragglers are still coming into Grantown. Luckily, it keeps light up here till after ten o'clock, which is a great boon, for nearly everyone is equipped with the tiniest outfits in lamps and generators.

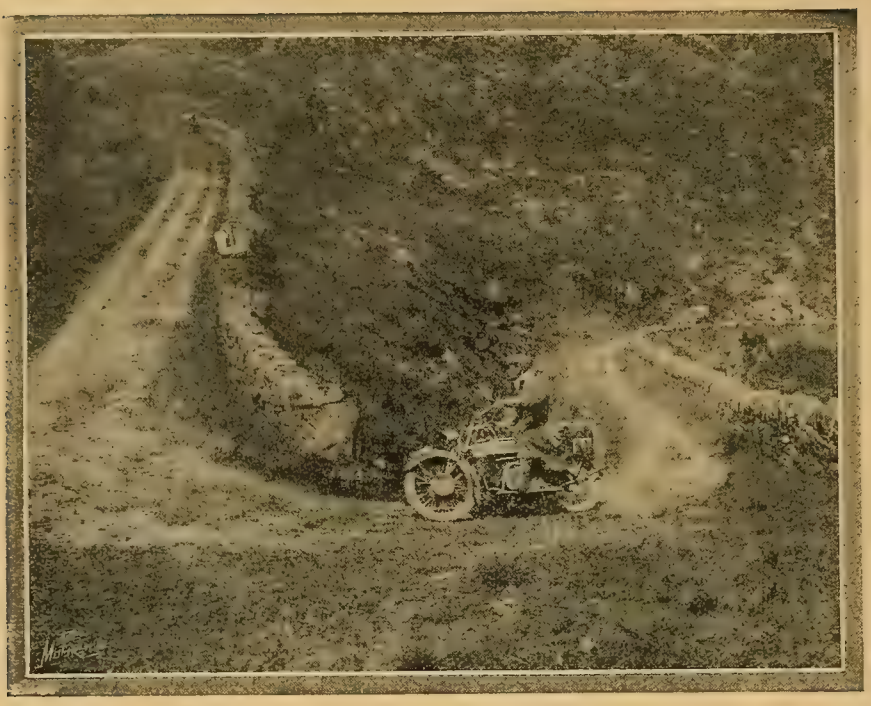
We are sorry to say that Mrs. Hardee has had a very nasty fall, which has caused her retirement when she practically had a gold medal in her grasp. She informed us this evening that she took a wrong turning on the way home from Fort Augustus, and did not discover her mistake till she had traversed five miles or so. Then she put on speed to make up time, and when she was travelling all out on her P. and M. the rear tyre burst and she was thrown with great force, and lay on the ground for some time, when two ladies picked her up. She was brought in by Sam Wright on his Humberette. Luckily, no bones were broken, but she naturally suffered from shock, and her machine was smashed.

The Tale of Woe.

Donaldson was towed in late on his Quadrant with timing gear troubles. One of the officials, Mr. Aitken, towed him in from Craggie Inn.

Gordon Fletcher smashed the frame of his Douglas on the way up Glenelg when crossing a donkey-back bridge at speed, and came in with the brake fastened up with straps, and Roberts broke the carrier on his Zenith at the same spot.

Miss Hammett had a day of trouble. The driving chain of her Douglas broke and, becoming entangled in the sprocket, locked the wheel, and she was thrown; and then she had great difficulty in fitting the spare owing to its being too short. Douglas Alexander stripped the second speed wheel in the gear box of his Williamson sidecar, and had to put it on the train for Inverness and retire from the Trial between Craggie Inn and Glendoe, and Macrae fell heavily near Fort Augustus and smashed the front wheel of his L.M.C. too badly to con-



Rex Mundy (8 h.p. Williamson) on the Applecross Hairpin. The Scottish Trials was Mundy's first experience of a Williamson, yet he again obtained a gold medal.

tinue. C. R. Collier had the misfortune to fracture the left back fork stay on his 8 Matchless sidecar, but strapped it up and got in to time without loss of marks, but whether it will hold together over to-morrow is rather doubtful. However, Collier is as expert a driver in a trial as he is in a race, and we should not be surprised to see him carry off a gold medal after all. Cocker tried to continue his climb up Glendoe on a flat tyre, with the result that his belt was pulled off three times and as he had such trouble with punctures and got in so late, he decided to give up. Generally speaking the remaining machines did well, and no praise is too high for any man, woman, or machine that survives this tremendous ordeal. We have no hesitation in describing these Trials as infinitely harder for machines and riders than the average English Six Days. The roads are in many places in such atrocious condition that it is impossible to make up any time even after the delay of a puncture.

There has been considerable dissatisfaction to-night concerning the official watches at the luncheon stop at Glenelg, it being alleged that they were five minutes in error.

It has been a very tiring day, and everyone was glad to see Grantown, and we fancy Edinburgh will be the pleasantest view to-morrow night that most of the riders have seen for a week. Late at night news has come in that Thompson has had a smash on his Bat, but hopes to continue. Chater-Lea has also broken his sidecar frame.

The cycle cars left in are going strong. The Humberette, Morgans, and G.W.K.s have certainly proved themselves thoroughly roadworthy machines.

The following have retired to-day:

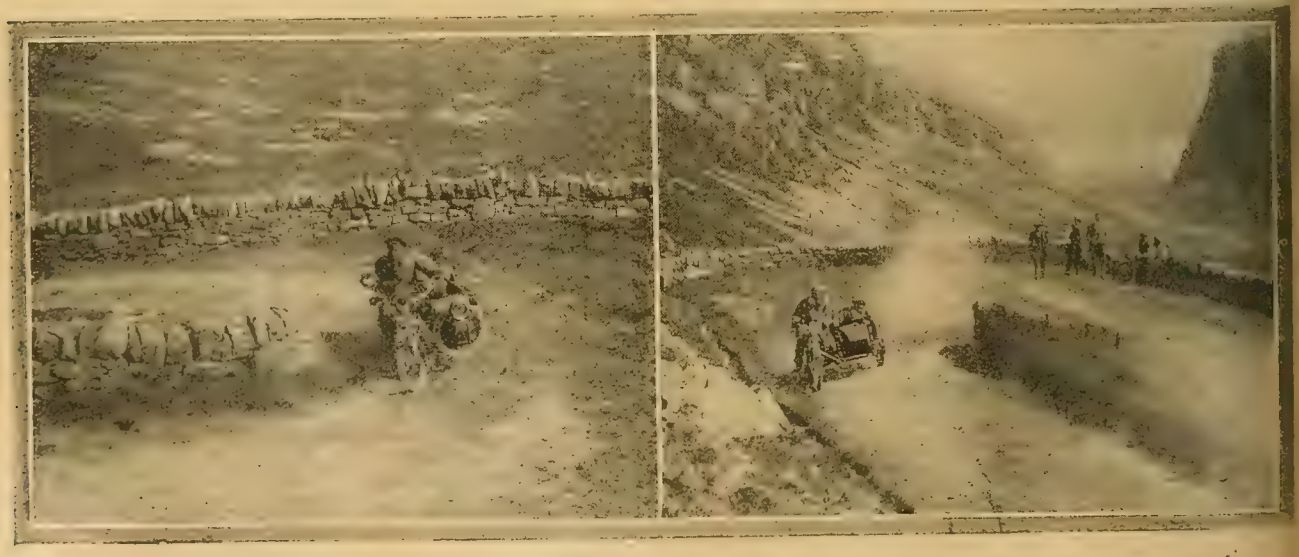
L. E. Cass (Trump-Jap), R. S. Macrae (L.M.C.), J. Cocker (Singer), Mrs. Hardee (P. and M.), D. Alexander (Williamson sc.), J. Donaldson (Quadrant), and T. Knowles (2¾ Humber).

The following lost marks:

W. H. Gibb (2¾ Douglas) and Miss Hammett (2¾ Douglas).

SIXTH DAY.—Grantown, Cockbridge, Braemar, Spital of Glenshee, Kirkmichael, Pitlochry, Ballinluig, Aberfeldy, Kenmore, Glenquaich, Crieff, Stirling, Falkirk, Edinburgh. 184 miles.

The magnificent weather, which has been one of the features of these Trials, held up to the end, and it was a perfectly glorious morning at Grantown, when at 7 o'clock the first man was sent off on the last stage of the Trials. Mrs. Hardee was out and about, the recipient of a great deal of sympathy for her smash overnight, and was bought on by an official car, which, by the way, was not quite so punctual as her P. and M. had invariably been, for tyre troubles galore overtook it, and it made a very late arrival in Edinburgh. Evil fate also overtook Mr. MacMillan's official Belsize car, for when only a few miles from the finish it tried conclusions with a commercial car, and came off very much second best, and had to be left derelict at the roadside. W. G. McMinnies, driving a Grand Prix Morgan, also had a remarkable escape, for when travelling at high speed his steering failed, and the vehicle dashed into a telegraph pole, and was totally wrecked. The driver escaped without



(1) J. Chater-Lea (Chater-Lea) and 2) R. E. Guest (Matchless sidecar) at the hairpin bend which was the crucial test on Applecross Hill.

Scottish Six Days' Trials.—

injury, but Johnny Gibson, his passenger, sustained injuries to his side, and it was feared some ribs were broken. It will be recalled that Gibson was badly hurt in the Isle of Man last year.

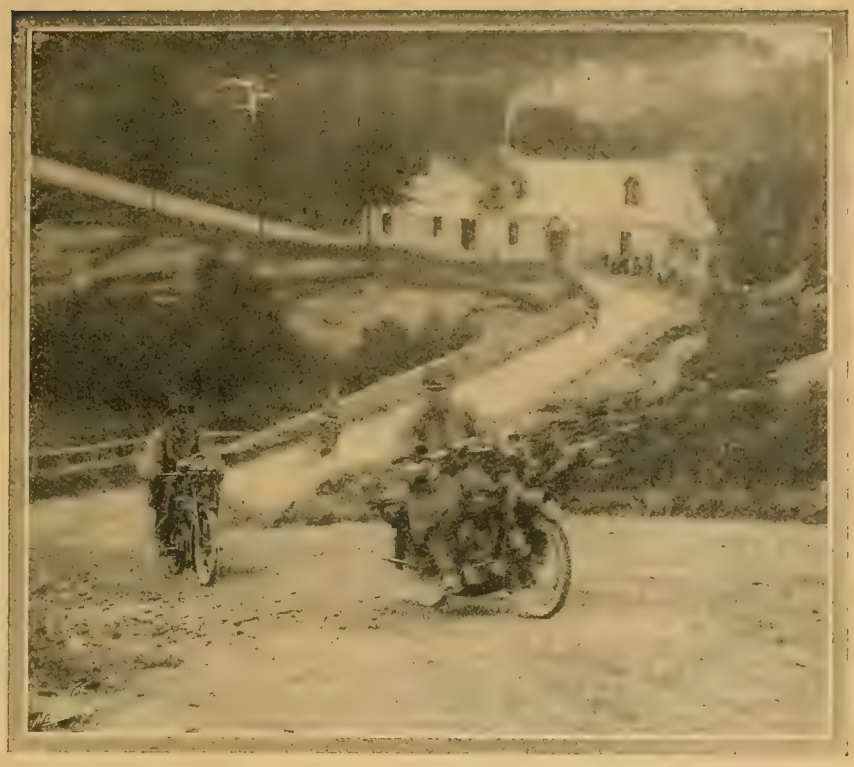
The last day's route was a severe one, for soon after the start the Cockbridge Ladder had to be climbed the reverse way to Monday's run, and the numerous gullies across the road made it an abominably uncomfortable ascent, and steering was very difficult. A mistake would have proved dangerous, as a precipice was on the right-hand side, and the road is very narrow.

Cases of Hard Luck on the Last Day.

Prior to reaching the hill, Sam Wright, whose Humberette had been going splendidly all the week, had the bad luck to be run into by a cart, the result of which was a broken front spring. Wright managed to make an excellent repair, but the delay cost him marks, and was fatal to his chances of a gold medal. It was a piece of real bad luck, and Wright would not be consoled.

Prior to the lunch check at Pitlochry, Morgan's steering gear went wrong, and he injured a front wheel and had to withdraw. Brittain (Bradbury) who was going well at Kenmore, also retired after descending Amulree, but, no account is available at the time of writing as to the nature of his mishap. MacGibbon (3½ Edmond) and A. W. Walden (3½ Premier) also retired on the last day.

Nearly everyone was early at Pitlochry, despite the Cockbridge climb, and the street of the little town was filled with men and machines killing time till they could check in. After Pitlochry the road was splendid for twenty miles till Kenmore was reached. Riding on in front of the men, we came across Lionel Martin, who had got his Singer light car running well again, and he gave a fine impromptu hill-climbing exhibition up Kenmore Hill. This gradient is the opposite side of Amulree, and is more severe. It is quite two and a half miles long, and contains seven corners, four of them being acute hairpins with precipitous gradients and loose, sandy, stony surface. We observed this hill very closely, because not only was it a very severe hill—some riders think it the worst of the trial—but, coming as it did on the last day and in the last sixty miles, it might well be thought that the engines would be showing signs of weakness.



G. I. Francis (Lea-Francis) and K. A. MacDonald (Singer) on the Bridge of Brown Hill, Tomintoul. This pair gained gold medals.

Taken as a whole, the result was remarkably good, and we only saw three actual failures.

Hoult (3½ h.p. Matchless) failed at the last bend but one, Begg (3½ h.p. Rudge) slipped up, and W. Pratt (P. and M) failed at the first hairpin. All three, however, made good restarts, and they got up well. The G.W.K.s and Blackburn's Morgan made splendid climbs, and C. R. Collier played with the hill on his big Matchless sc., while the Clynos ran up easily. The star performance was made by Hugh Gibson on his 3½ h.p. Bradbury sc. He climbed magnificently without the slightest sign of knocking on a 12 to 1 gear. Many of the solos, although climbing successfully,

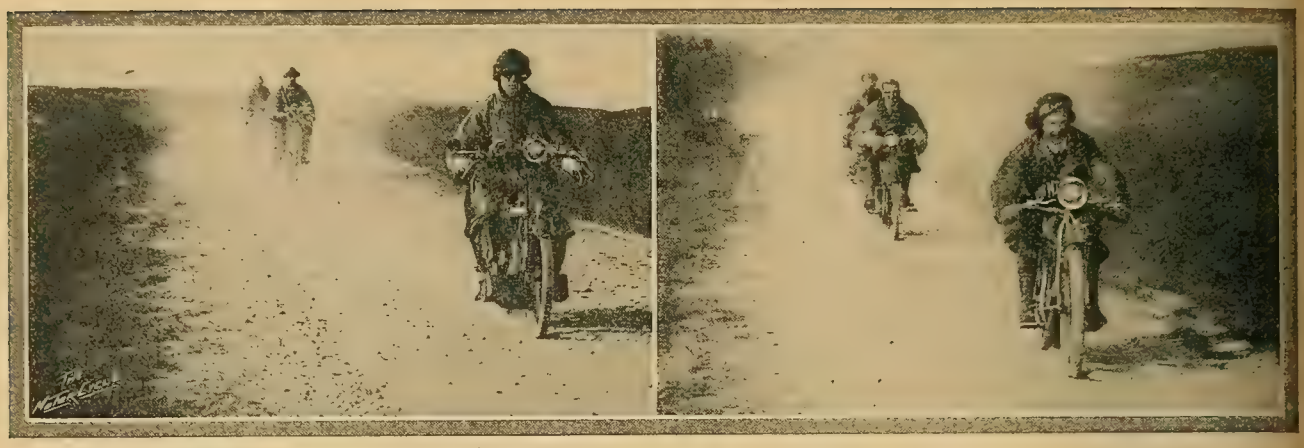
H. Harrison (Swift) and C. W. Meredith (Bradbury).



IN INDIAN FILE. A Lea-Francis rider leading a string of competitors near Strathpeffer.

E. A. Colliver (Indian), G. Featherstonhaugh (3½ h.p. Rover), and A. U. F. Downie (2¾ h.p. A.J.S.) This trio are among the gold medal winners.

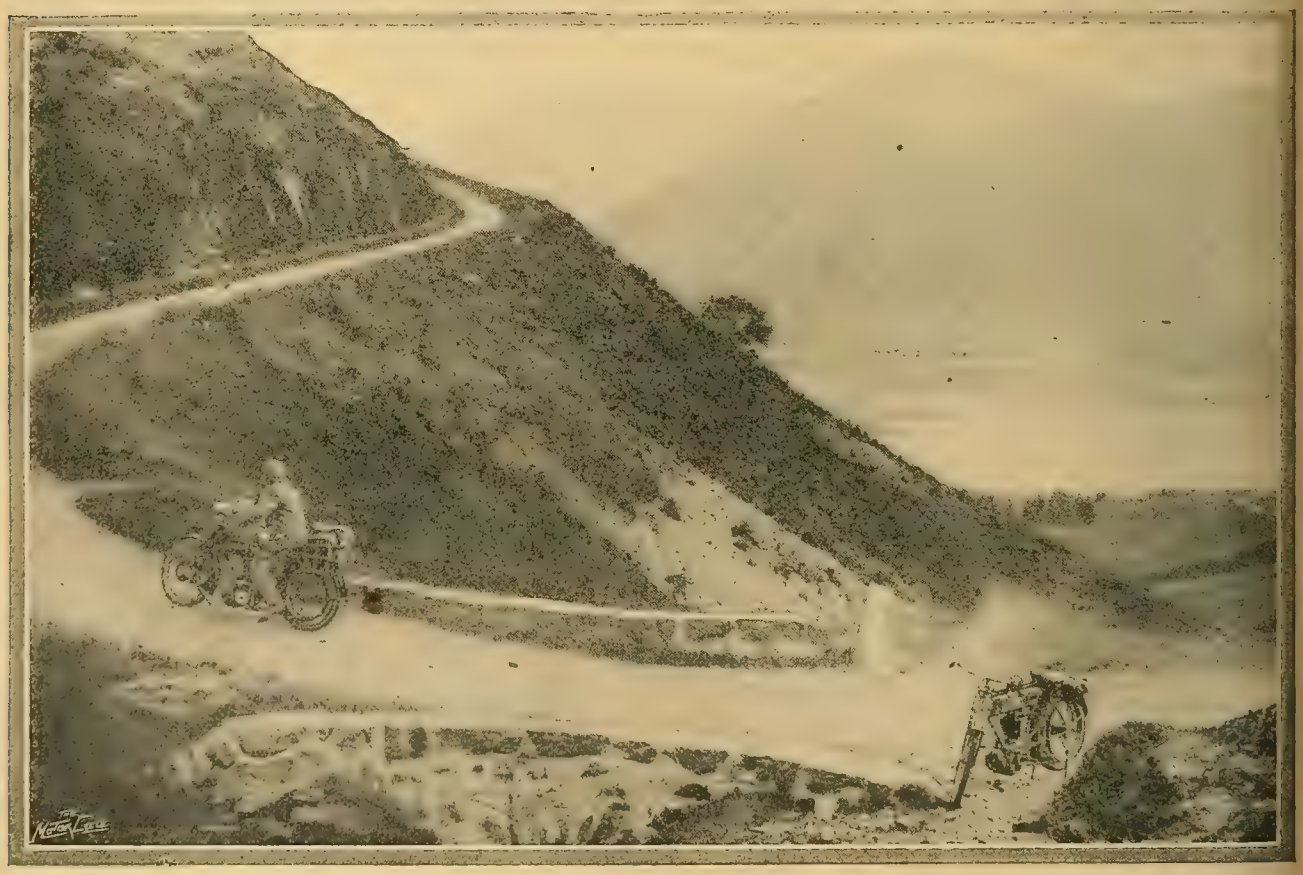
knocked frightfully at the hairpins. The little Connaught two-stroke went up beautifully, and the Indians, Rovers, and Bats were admirable, while the five Ariels were all splendidly handled, and got up easily.

Mrs. Baxter on her big Rex and Miss Hammett also made capital ascents. Once over the hill, the descent of Amulree required great caution, as the surface was appalling, but soon after the main Crieff road was reached, and on a magnificent surface we rode home through Crieff and Stirling to the Peebles motor garage, where the machines were placed for their examination by the officials.

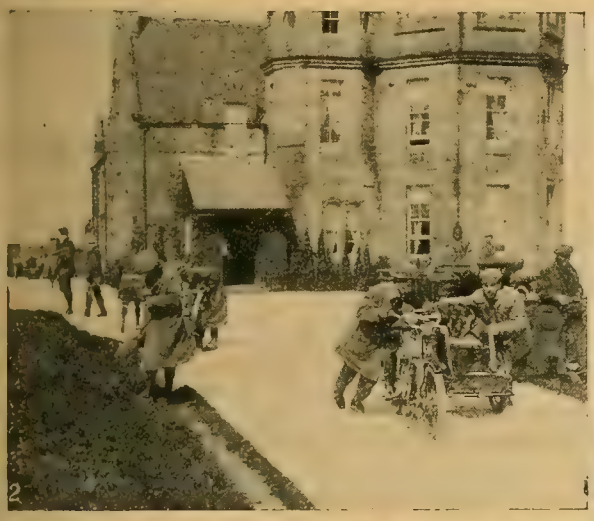
Fifty-nine Survivors.

Firty-nine actually finished, and most of the machines were in really wonderful condition after the tremendous gruelling they had undergone. Everyone was burnt brown by the six days of blazing sunshine, and, despite the hard work, all voted the trial a most sporting event.

The officials were splendid throughout, and the organisation wonderful, everything going without a hitch from the start. The enthusiasm displayed by the officials was delightful, and they were one and all ever ready to answer any questions put to them at any time with perfect good humour.



L. Sealey (two-speed B.S.A.) negotiating the S bend on Mam Ratachan Hill.



(1) A group of competitors at Thurso.

(2) Competitors at John-o'-Groats House on Wednesday.

(3) Miss Hammett (Douglas) on Applecross Hill. The photograph gives same idea of the gorgeous scenery.

(4) Miss Hammett (2¾ h.p. Douglas) on the narrow ascent of Kenmore Hill.

(5) A Clyno sidecar skidding round the second bend of Kenmore Hill.

CLUB NEWS.

Newton-Stewart and District M.C.C.

The first annual trial for the Picken Trophy was held on the 16th inst. Route: New Galloway, Penpont, Crawford, Abington, Biggar, Broughton, Moffat, Beattock, Dumfries, Maxwelltown, Castle Douglas, Gatehouse, to Newton-Stewart. The result was a tie between B. Jesson (3¾ h.p. Scott sc.) and J. Dunn (3½ h.p. Triumph), who each obtained full marks. A. Young (5 h.p. F.N.) was third.

Members of the Newton-Stewart M.C.C. on the occasion of the recent trial for the Picken trophy.

Western District M.C. (London).

A reliability trial was held on the 20th inst. for the Triumph Cup, from Ealing to Daventry and back, resulting as follows:

	m.	s.	
1. B. F. G. Fowke (Triumph), non-stop	1	2	early
2. R. F. Addey (Triumph), non-stop...	1	33⅖	early
3. G. Hinds (Douglas)	1	25	early

Surrey M.C.C.

The results of the members' speed trial at Clandon Park were as follows:

Class I.—1, C. A. Crow (2½ Singer), 47s., 309, silver medal; 2, S. H. Crow (2¾ Douglas), 48s., 387, bronze medal, 3, H. Butterworth (2¾ Douglas), 51.6s., 480.

Class II.—1, E. M. Wood (3½ Zenith), 40s., 314, silver medal; 2, T. G. Meeten (3½ Rudge), 40.6s., 335, bronze medal; 3, H. Mitchell (3½ Premier), 44.8s., 450.

Class III.—1, S. H. Crow (2¾ Douglas), 42.6s., 271 silver medal; 2, E. M. Wood (3½ Zenith), 39.2s., 294, bronze medal; 3, T. G. Meeten (3½ Rudge), 39s., 296.

Class IV.—1, T. G. Meeten (3½ Rudge sc.), 51.2s., 670, silver medal; 2, S. H. Crow (3½ Ariel sc.), 56.2s., 885, bronze medal; 3, P. Mitchell (3½ Premier sc.), 56.6s., 907.

All classes were decided on the formula CT^3. In Classes I., II., and IV., the figures given include the penalties for T.T. machines.

The silver medal for best performance by non-trade competitor and the bronze medal for the sealed handicap were both won by E. M. Wood.

Middlesex M.C.C.

The annual Stratford-on-Avon trial took place on the 13th inst. The following were notable performances on Sunrising Hill, the only real gradient on the course, and included in a non-stop section: Miss Hammett (Douglas), excellent; Tustin (Indian sc.), very good; Fletcher (Williamson sc.) displayed remarkable acceleration and Jennings (Precision sc.) did well to bring up the only single and sidecar; McNab, on a 6 h.p. Trump-Jap, came up very fast. Results:

Gold medals: H. C. Mills (Premier) and H. Karslake (Rover).

Silver medals: E. R. Hare (Enfield sc.), E. R. Cass (Trump-Jap sc.), Miss R. Hammett (Douglas), W. P. Tippett (Humber), W. Price (Rudge), A. C. Adley (Premier), P. C. Austin (Indian sc.), T. A. S. Brown (J.A.P.), C. Pearson (Douglas), A. Jennings (Precision sc.), G. Nott (Clyno sc.), and F. A. McNab (Trump-Jap).

Bronze medal: Victor Garland (Chater-Lea sc.).

North West London M.C.C.

The results of the members' hill-climb are as follows:

Class I.—1, Purchase (Douglas), 22⅖s., figure of merit 217; 2, Goddard (Douglas), 24⅖s., 230.

Class II.—Buchanan (New-Imperial-Jap), 16s.

Class III.—C. Rose (Indian), 17⅖s.

Class IV. (Passenger).—1, Dreydel (Ivy-Jap sc.), 24⅘s., figure of merit 259; 2, Wilmot (Morgan), 28⅕s., 297.

Fastest Time Classes.

Class VI.—1, Rowden (Douglas), 21⅗s.; 2, Purchase (Douglas), 22⅕s.

Class VII.—1, Buchanan, 16⅘s.; 2, C. Rose and Gwynne, 17s.

Class IX.—1, Dreydel (Ivy-Jap), 24⅘s.; 2, Down, 25s.

HERTS. COUNTY OPEN HILL-CLIMB.

The open hill-climb has been postponed until August 9th, and will take place at Kop Hill. The following are the classes:

Experts Only.—(1) Machines not exceeding 350 c.c.; (2) machines over 350 c.c. and under 500 c.c.; (3) any machine; (4) passenger machines up to 1,100 c.c.

General.—(5) Touring machines up to 350 c.c.; (6) touring machines over 350 c.c. and under 600 c.c.; (7) T.T. machines up to 500 c.c.; (8) any machines up to 1,000 c.c.; (9) passenger machines up to 1,100 c.c.

Classes 5, 6, and 9 will be decided by *The Motor Cycle* formula, $\frac{C \times l^2}{W}$

The rest will be decided on time only.

AMULREE IN THE SCOTTISH TRIALS. N. W. Downie (Lea-Francis) on the second bend.

NOTTINGHAM CLUB'S OPEN TRIAL.

On August 9th the Nottingham and District M.C.C. has arranged to hold a one day open reliability trial, the event being one to which the Manufacturers' Union decided to give their support. The first competitor will be despatched at 9 a.m., the remainder at intervals of thirty seconds. Entries close to-morrow (Friday) at ordinary fees.

BRITISH SUCCESSES IN THE BILBAO-SAN SEBASTIAN-BILBAO ROAD RACE.

THE SPANISH TOURIST TROPHY RACE.

(1) F. A. Applebee (Scott) who proved the winner of the 500 c.c. class.

(2) A. H. Alexander (Douglas), first in 350 c.c. class.

(3) Group of British riders at the conclusion of the race

4 Scene at the finishing point showing portion of the large crowd of spectators.

5 Applebee and Sorriguieta, first and second, lifted shoulder high.

Un aplauso: un aplauso es poco! The Spanish road race, the results of which we gave last week, has been a great success and a notable victory for British makers, for in the 350 c.c. class all the machines which got through came from this country, and the three leading riders were British. In the larger class an Indian took fifth place, and the rest of the machines were English. In fact, the English machines so predominated in the entry that it would have been strange indeed if they had not taken a prominent place in the results. All the British riders took part in the T.T. and Grand Prix races. The four foreign riders who were placed were mounted on Forward, Triumph, Rudge, and Bat. The course was 255 kilometres (158¼ miles). Applebee's speed averaged 43.1 m.p.h.

CLASS I.—CYLINDER CAPACITY UP TO 350 C.C.

Order.	Rider.	Nationality.	Machine.	Time of Outward Journey.			Time of Return Journey.			Total Time.

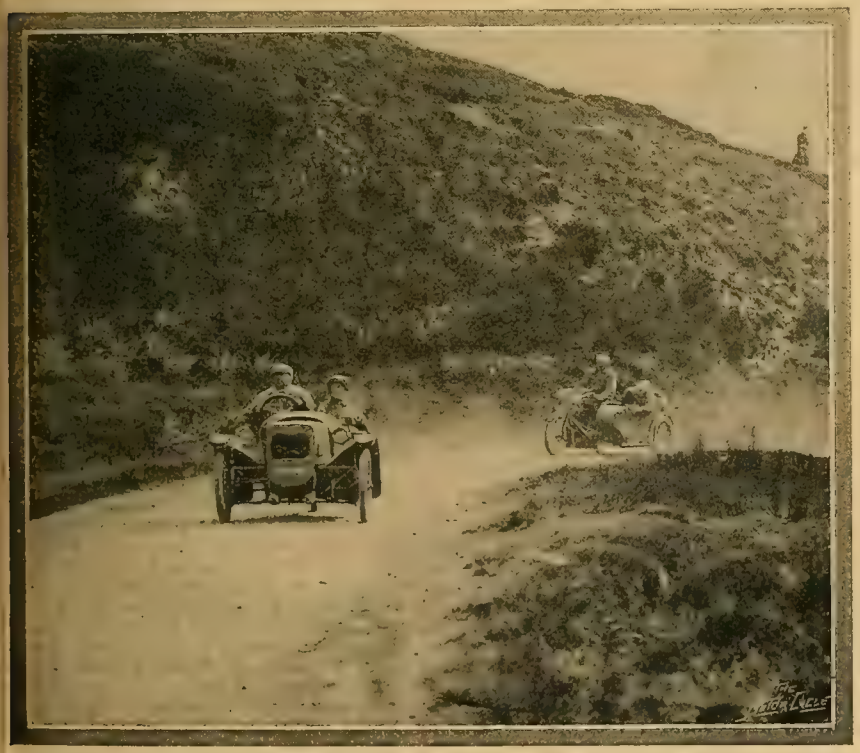
Impressions of the Scottish Trials.

The great outstanding feature of this year's Six Days' Scottish Trials, which came to a conclusion last Saturday was the magnificent weather. Seldom, if ever, can a full week of such tropical sunshine be experienced in the Highlands and, despite the dust, there was not a rider whose spirits were not cheered by the sight of the sun morning after morning. I suppose the wonderful clearness of the atmosphere away in the north, far from all chimneys and industrial centres, makes the sun far more felt than in the south, and nearly everyone might have been spending a week in the Tropics, judging by the sunburnt complexions which arrived at the Peebles Garage, Edinburgh, on Saturday evening. Everyone was glad, after a gruelling week, to see Edinburgh, and surely that exquisite city has never looked fairer than it did on that perfect summer evening. The absence of trams from the streets, due to a strike of the drivers, rather helped to set off the wonderful vista down Princes Street. Taxicabs were in great request, as everyone was too tired to walk the mile or so to the official hotel.

R. S. Macrae (L.M.C.) and R. Pearsons (Clyno sidecar) on Berredale Corner.

Scottish Keenness.

Our daily reports of the trials, written at considerable pressure nightly after a long arduous day with the competitors, were necessarily bound to be somewhat sketchy, and looking back at the last week it is now possible to view events and performances in their proper perspective. I was enormously impressed with a number of facts *re* motor cycling in the North generally, and was greatly struck by the tremendous keenness of the Scottish riders all over the country. The interest was of the keenest, even in the remote North and the number of people all over the route who were armed with the admirably got-up official programmes was remarkable. How the Edinburgh club had got these into the remote Northern and Western Highlands is a mystery, but nearly everyone seemed to have a copy, and every policeman we met was busy privately checking off the riders as they passed. I could not help thinking what a boon a good machine would be to the police in some of the rural districts. A southerner cannot understand the remoteness from anywhere of some of the places we visited, and I was told that at Applecross the policeman's beat extended for forty miles! To show the isolation of this spot I may mention that the post goes out once a week! Indeed, many of us wondered what the inhabitants would do with the considerable sum they collected for lunch in this wild spot, for there seemed no possible means of spending it there.



H. F. S. Morgan (8 h.p. Morgan runabout) and R. E. Guest (Matchless sidecar) in Glendoe.

Scottish Roads.

With regard to the roads we covered, many miles were terribly rough, and some of the trade riders complained bitterly of being asked to take their machines over such villainous surfaces. On the other hand, all the amateurs and some of the trade riders described the course as most sporting, "Rover" Newsome expressing himself as thoroughly pleased with it. I do not think that the various breakages which happened to some of the sidecar frames need be taken too seriously, and the sufferers in the trade will have gained a lot of valuable data for the construction of their colonial models. The English Six Days' Trials pale beside this test, and I think that a gold medal won in the Scottish Trials is worth a great deal more than one gained in England—a point which buyers should bear in mind when ordering their mounts for 1914.

I am certain that the greatest performance was that of Hugh Gibson with his

Impressions of the Scottish Trials.—

3½ Bradbury and sidecar. Not only did Gibson score a clean sheet, but he took his combination intact up every hill on the course without shedding his passenger, and I never even heard his engine knock, though I observed him very carefully on all the real hills. Gibson stands in a class by himself at this sort of work, and I doubt if there is another man in England who could duplicate his performance. His machine was in perfect condition at the finish, and he drove with the greatest skill throughout.

I was impressed very forcibly with George Brough's handling of his big single-geared twin. Brough is a perfect rider, but, nevertheless, it was a remarkably fine performance to go through without the aid of a gear box, and not only did he climb all the hills, but he did so with consummate ease. Indeed, I rather think that he made the ascent of the Devil's Elbow on the Spital of Glenshee on the first day with greater ease than any other competitor. He simply toyed with the climb, and his engine must be a marvel of flexibility. His machine was also in beautiful condition at the end, and I particularly noticed that his valve caps were not even discoloured.

After the Trials I accompanied him a further twenty miles, and thus observed him for a full thousand miles over the severest test roads that can be found in the British Isles. His John Bull tyres never punctured, and his machine had no other attention than filling up with petrol and oil. He carried two belts—one gave a gear ratio of 3⅞ to 1, and the other about 4½ to 1. He used the latter on Amulree, Applecross, and Kenmore, but when it is remembered that even users of the largest twins were glad to use their lowest ratios on these hills, his performance will be seen to have been remarkable.

The Smallest Engine.

The little 2½ two-stroke Connaught, the smallest engine in the Trials, ran wonderfully well, and carried a heavy rider through without a hitch. Although using petrol in Scotland, this machine normally runs on paraffin, and the spirit and oil are poured into the same tank. The Rev. R. M. Bankes-Jones did very well in losing no marks, as this was his first trial, and his P. and M. was only geared 9 to 1 on low gear. Rex Mundy handled the big Williamson solo with great address on the acute hairpins which abounded throughout the week, and the very easy starting of this machine greatly impressed me, a couple of steps at a walking pace sufficing even when cold. His tyres showed not a scratch at the finish. Large tyres were wisely fitted by a great many competitors, the three-inch Palmers and Kempshalls being popular.

The Lady Riders.

The ladies did well. Mrs. Baxter's handling of her big Rex, one of the heaviest machines running, was most masterly, and she was the only lady to gain a gold medal, though Mrs. Hardee had lost no marks on her P. and M. up to Friday afternoon, when she was the victim of a bad fall through her back tyre bursting when travelling at speed. Miss Hammett seems destined to find trouble in big six-day events, and although she finished she lost marks, and failed to annex a gold medal. Personally, I think these sort of events are too strenuous for ladies, and there is always the chance of a male competitor finding one of them stranded and losing his own gold medal in stopping to render assistance, which chivalry naturally demands in their case, though I daresay the ladies are quite skilful enough to effect their own repairs. But I know, from my own experience, that the strain of driving these big distances up to time over these dreadful surfaces is severe enough for a man.

The Cycle Cars.

Among the cycle cars, the G.W.K.'s did well, and but for the unfortunate burning of Wilberforce's little car on the first day would probably have finished a complete team. Wood made a mistake in driving at the last hairpin on Kenmore, changing up instead of down, and caused his engine to knock badly as he passed me, but he got up all right. Sam Wright handled his Humberette with great skill, and the Morgans were fast, but I thought tougher steering design was wanted for such rough work. M.S.

SPECIAL AWARDS.

The special awards were not decided upon until Monday evening, and were officially announced on Tuesday morning. We give them below:

Lightweight Class.—J. F. Morrison (2¾ Douglas).

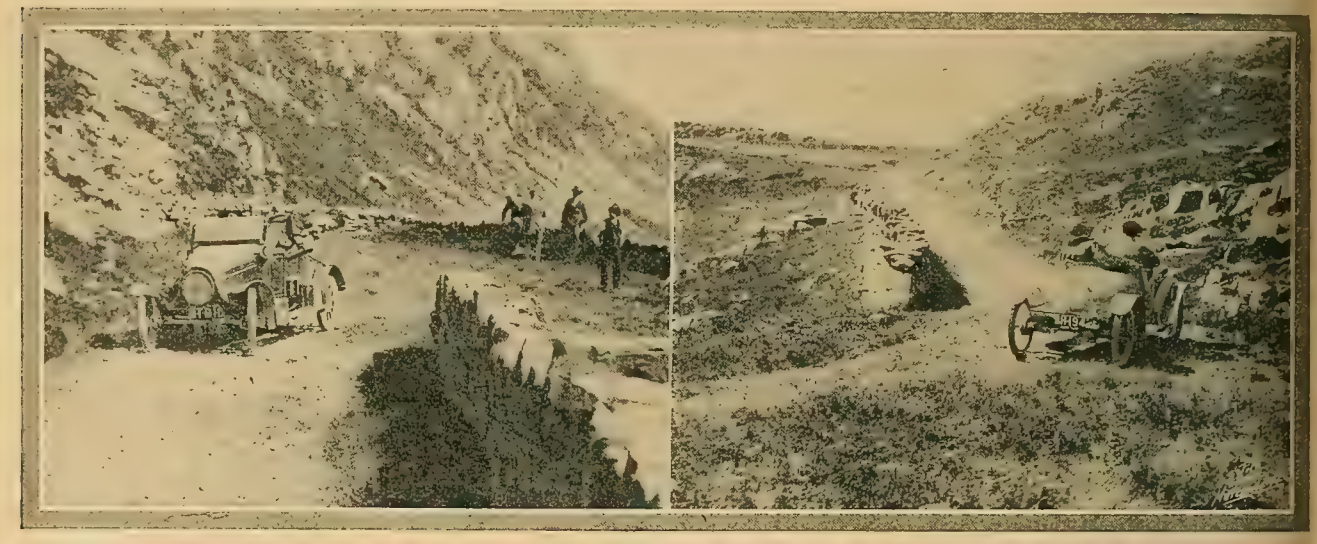
Passenger Class.—J. T. Wood (G.W.K. cycle car).

Club Award.—The Motor Cycling Club, represented by D. H. Noble, C. T. Newsome, and G. Featherstonhaugh, all 3½ Rovers.

Manufacturers' Team.—Components, Ltd., F. C. North, L. Newey, and V. Busby, all 3½ Ariels (subject to one time card being correct).

Agent's Nominee.—F. C. North (3½ Ariel) and S. T. Tessier (5-6 Bat) tied.

Private Owners.—W. C. Brandauer (7-9 Indian).



G. Armstrong on the 8 h.p. Gordon climbing Applecross Hill. Another aspect of the same hairpin showing a G.W.K. almost round the corner.

ENGLISH-DUTCH TRIAL.

Although the route for the above trial on August Bank Holiday remains a secret, we are able, for the benefit of motor cyclists who desire to see the trial, to give the following brief time-table:

Start from Oxford	...	9 0	a.m.
Pangbourne	... ...	10 0	,,
High Wycombe	...	11 24	,,
Tring (luncheon)	...	12 30	,,
Aylesbury	... ...	4 0	p.m.

A certain number of tickets are available for the official banquet at the R.A.C. on Saturday evening. We are asked to state that readers desiring to attend, may, by advising the trials secretary, Mr. W. Cooper, Elmcroft, Pinner Road, Harrow, by to-morrow (Friday) morning, enclosing 12s. 6d., obtain a ticket.

In connection with the prize fund, an interesting donation is that of Mr. I. Van Zwieten, of 56 62, Skinner Street, Pretoria, for £1 1s. Mr. Van Zwieten represents the Netherlands M.C.C. in South Africa, and has followed the trial through the medium of these pages.

CYCLE CARS AT LEICESTERSHIRE A.C. HILL-CLIMB.

On Saturday last the above club held a hill-climb at Beacon Hill, Woodhouse Eaves, in which one class was for cars up to 200 guineas and one for cycle cars up to 1,100 c.c. The positions on formula and time were :

	Time.
1. W. E. Bullock (10 Singer)	1m. 12⅖s.
2. J. E. Lester (10 Salmon)	2m. 24⅕s.

And in the class for cycle cars :

1. W. E. Bullock (10 Singer)	1m. 11⅖s.
2. T. H. Wathes (Morris-Oxford) ...	1m. 58⅖s.
3. J. F. Buckingham (Chota)	1m. 57s.

In each event an objection was lodged against the winner.

ENTRIES FOR BROOKLANDS BANK HOLIDAY MEETING.

AT the Bank Holiday Meeting at Brooklands there will be two races for motor cycles and one each for side-cars and cycle cars, particulars of which are given below. Racing commences at noon with one of the several car races on the programme.

12.25.—The August Sidecar Handicap. About 5¾ miles. Prizes—Cups, value £5, £3, and £2. For all classes of motor bicycles, the capacity of the engines of which does not exceed 1,000 c.c., furnished with sidecars and carrying one male passenger, weighing not less than 9½ stones.

Kenneth Holden (1-cyl. B.S.A.)
A. J. Luce (2-cyl. Zenith)
G. E. Stanley (1-cyl. Singer)
H. Jepson (1-cyl. Zenith)
H. A. Collier (2-cyl. Matchless)
J. Baxter (1-cyl. Armstrong-Villiers)
A. J. Brewin (2-cyl. Zenith)
F. W. Barnes (1-cyl. Zenith)
S. F. Garrett (1-cyl. Zenith-Green)
E. L. Moxey (2-cyl. Zenith)
V. E. Horsman (1-cyl. Singer)

2.5.—The Second Cycle Car Handicap. About 5¾ miles. Prizes—Cups, value £5, £3, and £2. For cycle cars, as defined by the Royal Automobile Club and Auto Cycle Union, carrying one male passenger at option.

J. T. Wood (2-cyl. G.W.K.)
H. E. Dew (2-cyl. D.E.W.)
G. W. Hands. (4-cyl. Calthorpe)
F. H. Ronksley (2-cyl. G.N.)
J. F. Buckingham (1-cyl. Chota)
J. C. Stringer 2-cyl. Winco)
B. Heywood (4-cyl. Singer)
A. E. J. Collins, R.E. (1-cyl. Chota)
R. V. Patterson (1-cyl. Chota)
J. V. Carden (1-cyl. Carden)
Cecil M. Whitehead (2-cyl. G.N.)
G. L. Holzapfel (1-cyl. Carden)
E. Jozot (2-cyl. Super)
D. C. Bolton (2-cyl. Bolton-Precision)

2.50.—The Thirteenth Long Motor Cycle Race. A handicap. About 8½ miles. Prizes—£10, £5, £3, or cups at option. For all classes of motor bicycles.

F. G. Edmond (2-cyl. Humber)
S. Yano (1-cyl. Triumph)
L. G. Brown (1-cyl. Corah)
E. L. Keller (1-cyl. Triumph)
J. A. Manners-Smith (1-cyl. Triumph)
Kenneth Holden (1-cyl. B.S.A.)
W. H. Wells (2-cyl. Indian)
F. C. Avery-Wright (2-cyl. Douglas)
George Roberts (1-cyl. Rudge)

SIX DAYS' TRIALS, 1913.

Entries for the A.C.U. annual Six Days' Reliability Trials in Lakeland up to date are given hereunder :

C. B. Moss-Blundell (Precision)
F. E. Bartlett (Endurance)
C. H. Norrington (Enfield sc.)
T. Stevens (James sc.)
M. C. Breese (B.S.A.).
P. Grout (A.J.S.)
W. C. Drake (P. and M.)
P. Shaw (P. and M.)
W. Pratt (P. and M.)
F. Crosthwaite (Matchless)
H. F. S. Morgan (Morgan)
R. C. Davis (Clyno sc.)
I. P. McDonald (Norton)
J. A. Neumann (Rudge)
F. W. Applebee (B.SA.)
S. Sawer (Premier)
A. E. Catt (Triumph)
P. D. Walker (Summers and Harding)
J. D. Morrison (Bat)
J. Tippens (Rudge Multi)
J. H. Kerr (N.S.U.)
F. Dover (Premier)
T. J. Ross (Triumph)
G. D. Hardee (Triumph)
W. J. M. Sproulls (P. and M.)
F. K. Portway (Paragon cycle car)

A PROLONGED HILL-CLIMBING TEST.

ON Saturday last the Coventry and Warwickshire Motor Club held the annual trial for the Manville Trophy, presented by Mr. Edward Manville, J.P. The course, which measured 145 miles, was particularly severe, embodying no fewer than fourteen hills having gradients approaching 1 in 6. In short, all the noted acclivities on the Edge Hill and Cotswold ranges were included. There were thirty-one competitors on all types of motor vehicles, except cycle cars, which class received no support. Naturally with such gradients to contend with, it was not long before there was a thinning of ranks, and by the time the luncheon stop at the top of Birdlip was reached seven or eight were out of the running. As times were taken at the very summit of the hill, competitors found considerable difficulty in gauging their time accurately, as to slow down on a 1 in 6 gradient was not within the capacity of most. S. A. Rowlandson adeptly manipulated his Rudge-multi, and was practically dead on time. The return journey was equally severe, including a second climb up Sudeley. The three smallest powered machines—a Hobart and two Humbers—showed up particularly well on the hills, as also J. R. Haswell's Triumph sidecar. The trial erred in one direction only, and that was the intricate nature of the course, which it was impossible to follow with certainty by means of a route card only. As a result many left the route. The finish was at the Round Tower at the summit of Edge Hill.

The results were declared on the riders' ability to climb every hill and run to schedule. a secret check being introduced. S. A. Rowlandson (Rudge) easily came out top with a total deviation from the 20 m.p.h. schedule of 1m. 26s. In the sidecar class J. R. Haswell (Triumph sidecar), who lately openly expressed his pronounced disapproval of time checks to decide winners (and we must say we agree with him), proved himself a more expert timekeeper than his fellow competitors, his error only being 3m. 8s.

The list of survivors and their errors are appended :

MOTOR CYCLES.

Rider and machine.	Error. m.	s.
S. A. Rowlandson (3½ Rudge-multi) ...	1	26
A. N. Barratt (3½ Rudge-multi)	3	6
H. G. Liefieldt (3½ Rudge-multi)	3	9
D. Elson (6 Rex)	4	41
J. H. Pountney (3½ Rover)	5	55
Geoffrey Smith (2¾ Humber)	6	33
C. W. Graham (3½ Triumph)	8	11
W. G. Blatch (5-6 Rudge)	9	8
L. A. Pollack (3½ Singer)	9	17
M. Anderson (2¾ Humber)	9	20
J. Dudley (2½ Hobart)	9	46

SIDECARS

Aug.	2nd	... ...	8.46 ,,
,,	4th	... ...	8.42 ,,
,,	6th	... ...	8.39 ,,

The New Affiliation Scheme.

The committee of the Coventry and Warwickshire Motor Club has decided to affiliate to the Auto Cycle Union under the new five shilling scheme, no extra subscription being charged to members.

The Scottish Trials.

The excellent photographs of the Scottish Trials reproduced in this issue were taken by one of our staff photographers, who accompanied the competitors throughout on his 2¾ h.p. Douglas.

The final results of the Trial were issued on Tuesday morning, and appear in this issue.

Oils and Accessories.

Reverting to the paragraph in our last issue concerning oil used by the Grand Prix winner, T. E. Greene, we have received a letter from Messrs. C. C. Wakefield and Co. enclosing a copy of a letter received from the rider in question, stating that he used Castrol "C" exclusively in the Grand Prix and in the Spanish race. We give it up at this!

Scottish Border Hill-climb.

The winners of the first four classes are as follows:

CLASS I., FORMULA, OPEN (Lightweights up to 350 c.c.—Jas. Steele, Edinburgh (2¾ Douglas), 66s., 508 formula.

CLASS II., FORMULA, NOVICE (Singles over 350 c.c.)—K. J. P. Laing, Hawick (3½ Triumph), 59s., 669 formula.

CLASS III., FORMULA, NOVICE (Twins over 350 c.c.)—J. Balfour Robertson, Edinburgh (3½ Indian), 66⅕s., 708 formula.

CLASS IV., FORMULA, OPEN (Singles over 350 c.c.) — A. J. C. Lindsay, S.B.M.C.C. (3½ Rover), 57s., 593 formula.

Olympia Space All Let.

All the space available for the Motor Cycle Show is over applied for, and at this early date there is not an inch to let anywhere in Olympia. Over eighty firms who exhibited last year will be unable to show this time, as, not being members of the Union, their applications for space could not be entertained, in view of the fact that about sixty new members have joined. All the exhibitors next November are members of the Motor Cycle Manufacturers' Union. To make room for some of the tyre firms, the exhibitors' office space in the annexe has been curtailed, but tyres only will be on view there.

Another New Club.

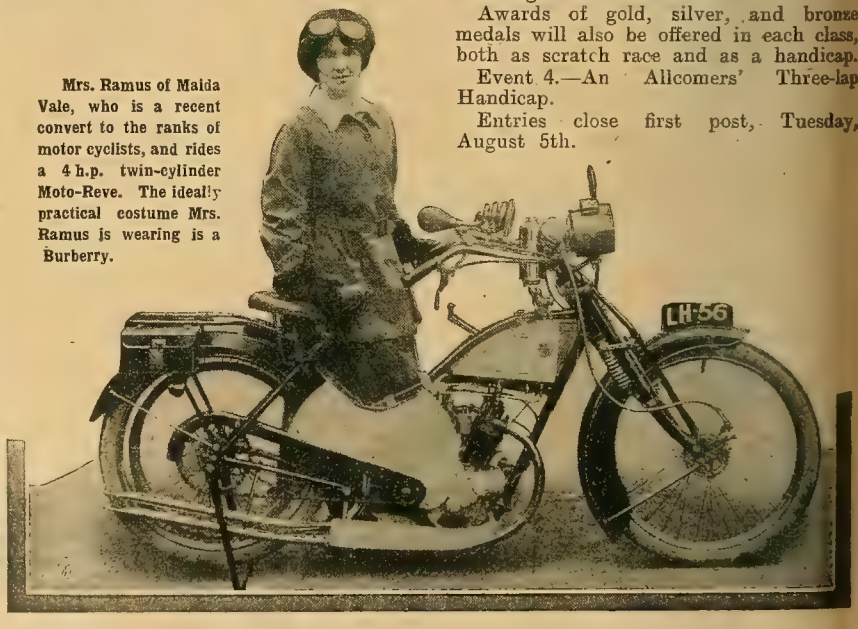
The latest club is the West Hants M.C.C., for motor cyclists in the neighbourhood of Wimborne. Affiliation is being sought to the A.C.U.

The Colwyn Bay Speed Trials.

In connection with the Colwyn Bay speed trials, the Mersey M.C. reports a correction. W. Heaton (2¾ A.J.S.) gained the second place in the 350 c.c. class and not V. Busby. In writing, Mr. Carty incidentally mentions that the prize fund amounted to the big sum of £160, and the Mersey M.C., having now settled all the accounts, find that it is a matter of a couple of pounds on the adverse side. But there is more than this amount to the credit of such a young organisation for its successful handling of the event.

Brooklands Six Hours' Race.

The official times for the recent Brooklands six hours' race (350 c.c. class) show that the first 3 h.p. Enfield actually covered a distance in excess of that first recorded. The exact figures are: 302 miles 1,521 yards. The Enfield performance in running into second, third, and fourth positions was considered so meritorious by the B.M.C.R.C. that three gold medals are being specially awarded to the Enfield riders. This is an unprecedented feature of a six hours' race, and bears testimony to the wonderfully regular running of the Enfield team.



Mrs. Ramus of Maida Vale, who is a recent convert to the ranks of motor cyclists, and rides a 4 h.p. twin-cylinder Moto-Reve. The ideally practical costume Mrs. Ramus is wearing is a Burberry.

SPECIAL FEATURES:

OFFICIAL ROUTES AND MAPS OF THE A.C.U. SIX DAYS' TRIALS.

CONTINUATION OF SCOTTISH TRIALS REPORT.

A STUDY IN CARBURETTER DESIGN.

Mont Ventoux Hill-climb.

The date of the Mont Ventoux hill-climb has been altered from August 9th and 10th to August 23rd and 24th. This is to allow competitors in the French International Cup Race at Le Mans who will also compete in the climb to have time to get to Mont Ventoux and make their trial ascents before the date of the event.

The Next B.M.C.R.C. Meeting.

The sixth members' meeting will take place on August 9th. The programme is:

Event 1.—The 350 c.c. 10 mile Record Race and Sealed Handicap, for motor cycles of Class A or B.

Event 2.—The 500 c.c. 10 mile Record Race and Sealed Handicap, for motor cycles of Class C.

Event 3.—The 1,000 c.c. 10 mile Record Race and Sealed Handicap, for motor cycles of Class D or E.

The above three races will provide an opportunity for establishing a ten-mile standing start record in each class.

Awards of gold, silver, and bronze medals will also be offered in each class, both as scratch race and as a handicap.

Event 4.—An Allcomers' Three-lap Handicap.

Entries close first post, Tuesday, August 5th.

Another Motor Cycle Club.

It is proposed to form a club for riders living in the neighbourhood of Belsize Park, N.W. Those interested should apply to Mr. G. O. Duggan, 11, Belsize Park Gardens, Hampstead, N.W.

International Cup Race.

Forty-four entries have been received for the Coupe Internationale des Motocyclettes and Motocycles, organised by the Automobile Club de Sarthe, which will be held on August 4th on the Circuit du Mans. Motor cycles will race over 324 kilometres and cycle cars and sidecars 270 kilometres. The entries are evenly divided between the solo and passenger machines. The classes will be divided as follows: Motor bicycles, 250, 350, and 500 c.c.; sidecars or tricars, 350, 500, 750, and 1,000 c.c.; cycle cars, 750 and 1,100 c.c. Competition will be keen between the Peugeot, Clément, Alcyon, and Griffon firms in the motor bicycle class. In the cycle car class, the Singer Co. has entered one of the four-cylinder cycle cars, and Peugeot Frères will race with three of the four-cylinder Baby Peugeots, which will be their first appearance in an important race. Among other four-wheelers will be a Belgian-made Fif, four cylinders, 59×100 mm., a vehicle new to British readers. In this race the competitors in each class will be started together, commencing with the speediest, so that spectators will be able to follow the results better.

FUTURE EVENTS.

Aug. 2-4.—M.C.C. Devon Trial.
" 4.—English-Dutch International Trial. Starting Point Oxford.
" 4.—B.A.R.C. Meeting at Brooklands.
" 9.—B.M.C.R.C. Race Meeting.
" 9.—Liverpool A.C.C. Open Trial.
" 9.—Nottingham and District M.C.C. Open One Day Trial.
" 9.—Herts. County A.C. Open Hill-climb at Kop Hill.
" 18-23.—A.C.U. Six Days' Trials. Carlisle as Centre.
" 30.—Streatham and District M.C.C. Annual Open Hill-climb.
" 30.—Hertfordshire M.C.C. Open Trial.
Sept. 6.—Coventry and Warwickshire M.C. Annual Open Hill Climb.
" 13.—B.M.C.R.C. Race Meeting.

Inter-club Team Trial.

For the inter-club team trial, organised by the Brookdale club for August 9th, the following have promised teams: Streatham and District, Woolwich, Plumstead and District, Purley and District; and the following are likely entrants: Surrey, Cardiff, and Tunbridge Wells. The promoting club will, of course, also put up a team. The course is a thoroughly sporting one, with a number of severe hills, and there are no secret checks, as it is anticipated that no team will finish complete. Teams consist of six, at least one of which must be a passenger machine.

Tourist Trophy Car Race in 1914.

A Tourist Trophy Race for cars is to be organised by the Royal Automobile Club, and will be held in the Isle of Man in June, 1914. The regulations will be issued at the end of next week. The Society of Motor Manufacturers and Traders and the R.A.C. are in entire accord concerning the regulations. The race will be a two-day event, for cars fitted with four-cylinder internal combustion engines, about three hundred miles being run each day.

SCOTTISH TRIALS. Hugh Gibson (3½ Bradbury sidecar) followed by a Bat sidecar on Glendoe Hill.

OFFICIAL MAPS AND CONTOUR SECTIONS OF THE ROUTE FOR THE A.C.U. SIX DAYS' RELIABILITY TRIALS.

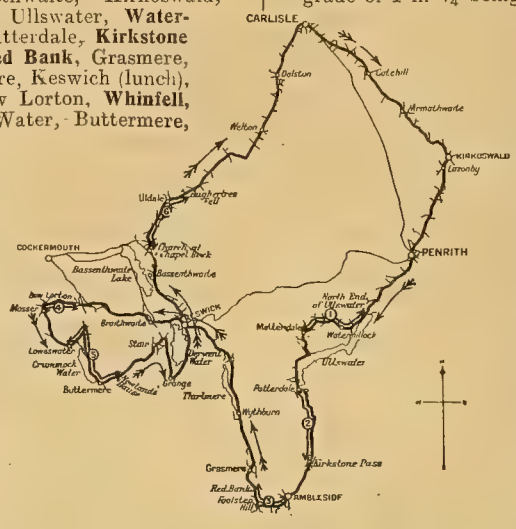
This week we are able to give the official routes and daily distances of the annual Six Days' Trials of the Auto Cycle Union, to be held chiefly in Lakeland, from Monday, August 18th, to Saturday, the 23rd. This year the first five days only will be devoted to testing the machines, and in that period a total of 783 miles will be covered. The sixth day will be devoted to a minute inspection of the machines, and marks awarded accordingly.

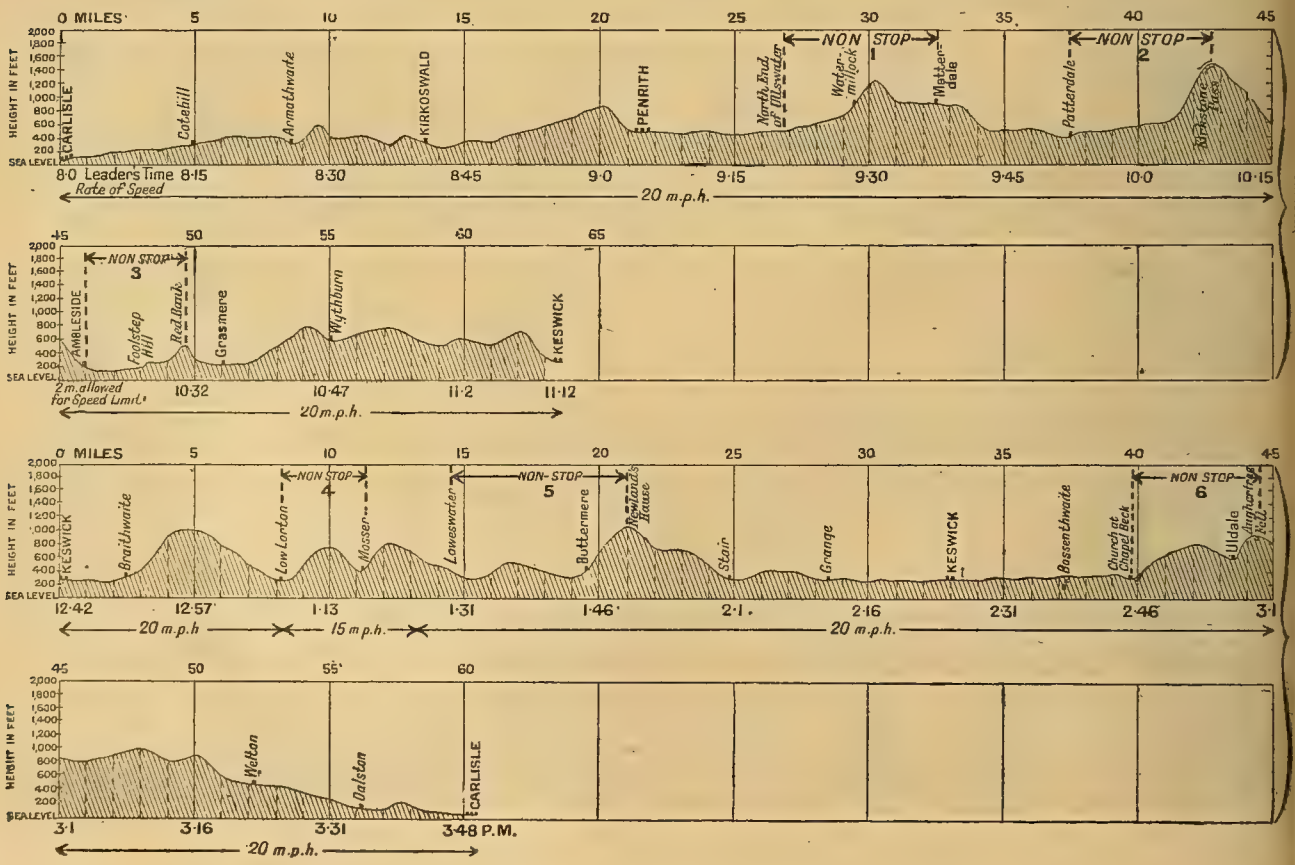
The description of the route, as well as the maps, are exclusive to "The Motor Cycle." The double lines on the maps refer to non-stop sections.

MONDAY (124 miles).

ROUTE: Carlisle, Cotehill, Armathwaite, Kirkoswald, Lazonby, Penrith, North End of Ullswater, **Watermillock,** Matterdale, Ullswater, Patterdale, **Kirkstone Pass,** Ambleside, **Foolstep Hill, Red Bank,** Grasmere, **Dunmail Raise,** Whitburn, Thirlmere, Keswich (lunch), Braithwaite, **Whinlatter Pass,** Low Lorton, **Whinfell,** Mosser, Loweswater, Crummock Water, Buttermere, **Buttermere Hause,** Newlands, Stair, **Gutherscales Hill,** Grange, Derwent Water, Keswick, Bassenthwaite, **Uldale, Aughertree Fell,** Welton, Dalston, and Carlisle.

Monday will be spent entirely among the lakes and hills of Cumberland. Until Ullswater is reached the road presents no difficulties, and the first climb will be **Underwood Hill** to **Watermillock Hause,** nearly a mile and a quarter in length, the upper portion, which contains three sharp turns, being the most difficult. The steepest pitch has a gradient of 1 in 4½. At Matterdale there is a turn to the left, and the lake is regained by descending the hill from Dacray, which passes near Aira Force. **Kirkstone Pass,** from the Ullswater side, is a long steady climb, the steepest grade of 1 in 4¾ being near the top. This is followed by the steep descent to Ambleside. **Foolstep** is a short hill, but it contains a sharp double turn near the top with a gradient of 1 in 3½. **Dunmail Raise,** should present no difficulty to the modern machine with its straightforward rise and good surface, 1 in 7 being the steepest grade. Then follows a beautiful run past Thirlmere to Keswick, over **Whinlatter Pass,** which rises nearly 720 feet in two miles, with two steep pitches (the worst being 1 in 5½) in the lower part. On the other side of Lorton Valley Whinfell (1 in 4½) has to be crossed. The road by Crummock Water to Buttermere is charming. Here a sharp turn to the left brings the riders on to **Buttermere Hause,** one of the stiffest hills in the Trials. There is a rise of 700 feet in less than a mile and a half, there are corners on a 1 in 4½ grade, eight deep water channels cut across the road, and a short rocky stretch of 1 in 3¾.



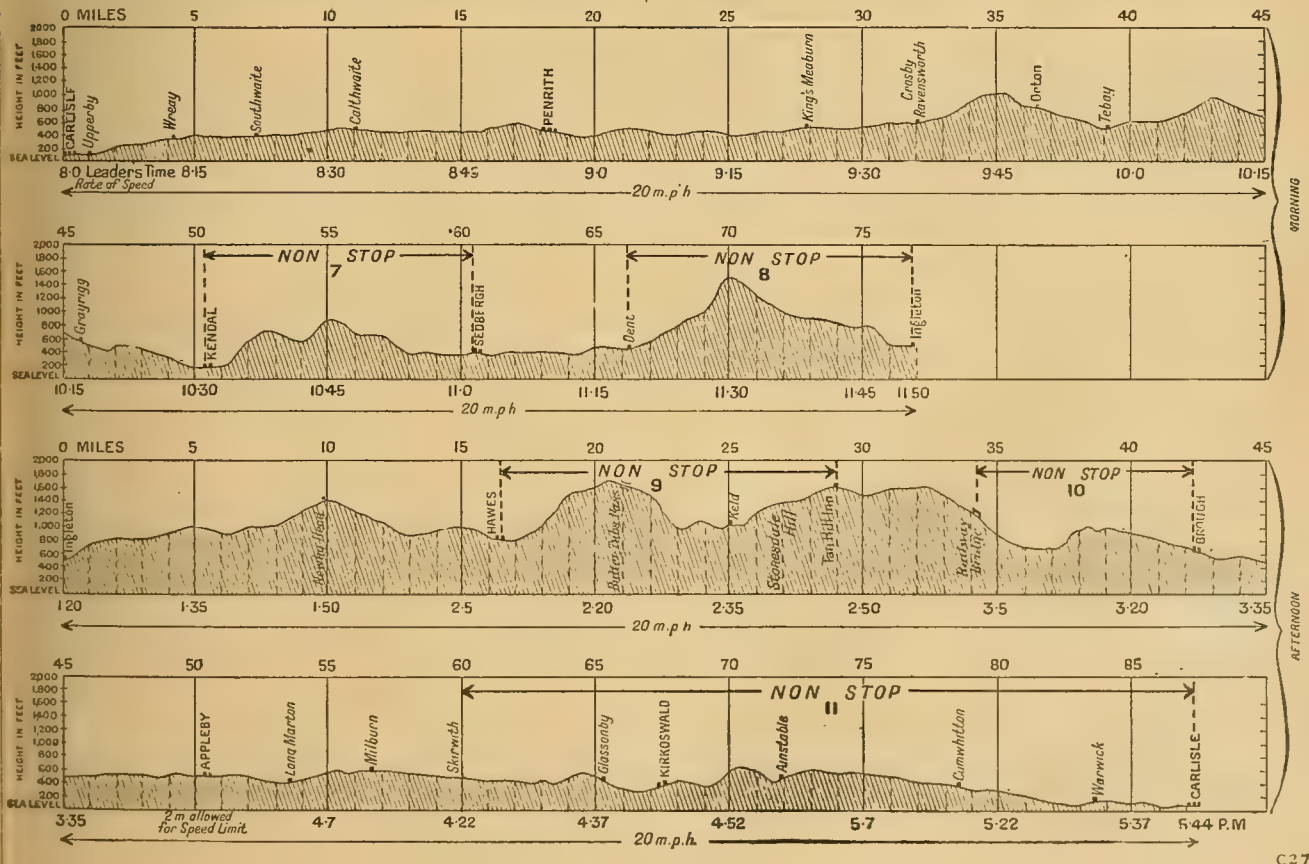


TUESDAY (164 miles).

ROUTE: Carlisle, Upperby, Wreay, Southwaite, Calthwaite, Penrith, King's Meaburn, Crosby Ravensworth, Orton, Tebay, Grayrigg, Kendal, Sedbergh, Dent, **White Shaw Moss,** Ingleton (lunch), **Newby Head,** Hawes, **Butter Tubs Pass,** Keld, **Stonesdale Hill, Tan Hill Inn,** Brough, Appleby, Long Marton, Milburn, Skiwith, Glassonby, Kirkoswald, Ainstable, Gumwhitton, Warwick, Carlisle.

On Tuesday the road lies through several counties and touches the Pennines as well as the Cumbrian hills. As before there is little of note until after passing Penrith, which is reached by byroads. Beyond Crosby Ravensworth there is a two and a half mile climb on moorland roads over the fell, followed by a drop to Orton and a second to the River Lune, near which the road lies for some miles till, with a right-hand turn, the ascent past Grayrigg Common commences, followed by about five miles of hilly road to Kendal. In Kendal a turn is made eastward and the ascent to **Park Head,** a rise of 500 feet in about a mile, begins almost immediately. Then follows a switchback road over the fells, with many turns and sharp rises to Sedbergh (known for its school).

At Sedbergh a sharp turn is made to the right and the road through Milnthorpe is taken up Dentdale and Deepdale. The road has been rising for some miles, but there is much more to come, as the pass over **White Shaw Moss,** between Whernside and Foul Moss has to be crossed. This is about 1,700 feet above sea level, more than 200 feet higher than Kirkstone Pass, and contains an S bend on a steep grade above Gastack Beck. Thence there is a long descent past Long Gill and Kingsdale Beck to Ingleton and the lunch stop. The afternoon's run begins with a long pull to Scar Close, a short drop to Ribble Head, and another long rise to **Newby Head,** after which there is a descent of five miles or so down Widdale to Hawes. Crossing Wensley Dale the riders at once begin the ascent of the **Butter Tubs Pass,** which was described fully in our issue of Nov. 7th, 1912, and then, drop into Swale Dale, and making for Keld and West Stones Dale face the long ascent to **Tan Hill Inn,** about 1,700 feet above sea level. The road now turns to the left over Causey Moss, maintaining a high level until the five-mile descent to Brough is reached. The more severe hills are now past, but there is much more minor climbing in the lanes between Appleby and Carlisle.



WEDNESDAY (147 miles).

ROUTE: Carlisle, Dalston, Welton, Warnell Fell, Caldbeck, Hesket Newmarket, Mungrisdale, Threlkeld, Wythburn, Dunmail Raise, Grasmere, **Red Bank**, Skelwith Br., Coniston, Torver, Blawith, Lowick, **Kirkby Moor**, Beckside, Ulverston, (lunch), **Higher Lath**, Grizebeck, Broughton-in-Furness, Ulpha, **Kiln Bank**, Broughton Mills, Broughton-in-Furness, Ulpha, **The Seat**, Eskdale Gn., Gosforth, Calder Br., **Cold Fell**, Ennerdale Bridge, **Crossdale**, Lamplugh, Mockerkin, Cockermouth, Bothel, Mealsgate, Red Dial, Thursby, and Carlisle.

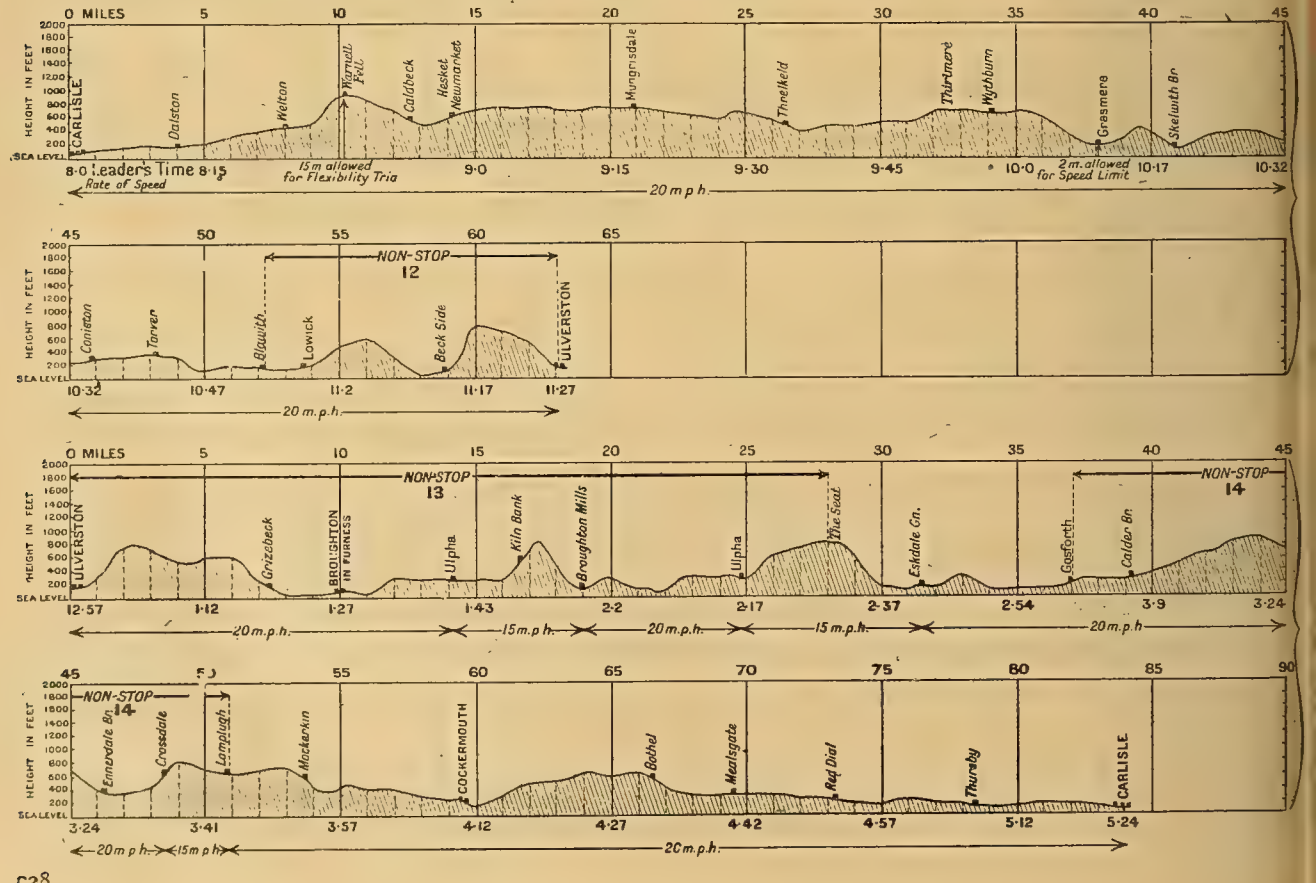
On Wednesday, the second day amongst the Lakeland hills **Red Bank** will be the first interesting climb. It will be reached by Caldbeck, St. John's Vale, and the easy side of Dunmail Raise. Red Bank usually troubles some or other of a company of riders. The surface is splendid and the corners are not troublesome; simple steepness is the feature of this well-known hill. The middle section is the most trying of all, the steepest gradient being 1 in $3\frac{2}{3}$.

Oxenfell is a main road hill which will be crossed on the way over to the Coniston Valley from Skelwith Bridge. It is nearly half a mile long, and has two hidden corners and a gradient on the upper part of 1 in 5.

After a pleasant run by Coniston Water and down the valley to Lowick, where a turn is made to the right, Kirkby Moor has to be crossed to Beckside and the fells recrossed to Ulverston.

Kirkby Moor Hill is practically two miles in length. Though not excessively steep it is a trying test for air-cooled engines. There are long stretches of 1 in $4\frac{1}{2}$ and 1 in 5 during the ascent from practically sea level to a height of nearly 900 feet. The surface is good. The same may be said of **Higher Lath Hill**, which will be climbed at the outset on the return journey northward from Ulverston. The latter hill is decidedly curly, and an upper sharp turn to the left, where a farmhouse stands on the right, will prove a problem to many. The middle part of the hill has a gradient of 1 in $3\frac{3}{4}$.

Dudden Dale is now ascended to Ulpha, where a circuit will be made to include **Kiln Park Brow**. This is a long, engrossing climb, full of sharp turns, abounding with gradients of 1 in $4\frac{1}{2}$. The surface is good. The fells are then crossed to Eskdale, and a pretty road is followed to Calder Abbey, where the ascent of **Cold Fell** begins. The surface is good, but there are about fifty water courses cut across the road. About 1 in 5 is the steepest gradient. The last climb is **Crossdale Hill**, near Ennerdale, with four turns and a gradient of 1 in 4 at the steepest part. Then follow some pretty but twisty lanes through Lamplugh to Cockermouth, a little town on the Derwent, whence the main road over Moota Common leads to Carlisle.



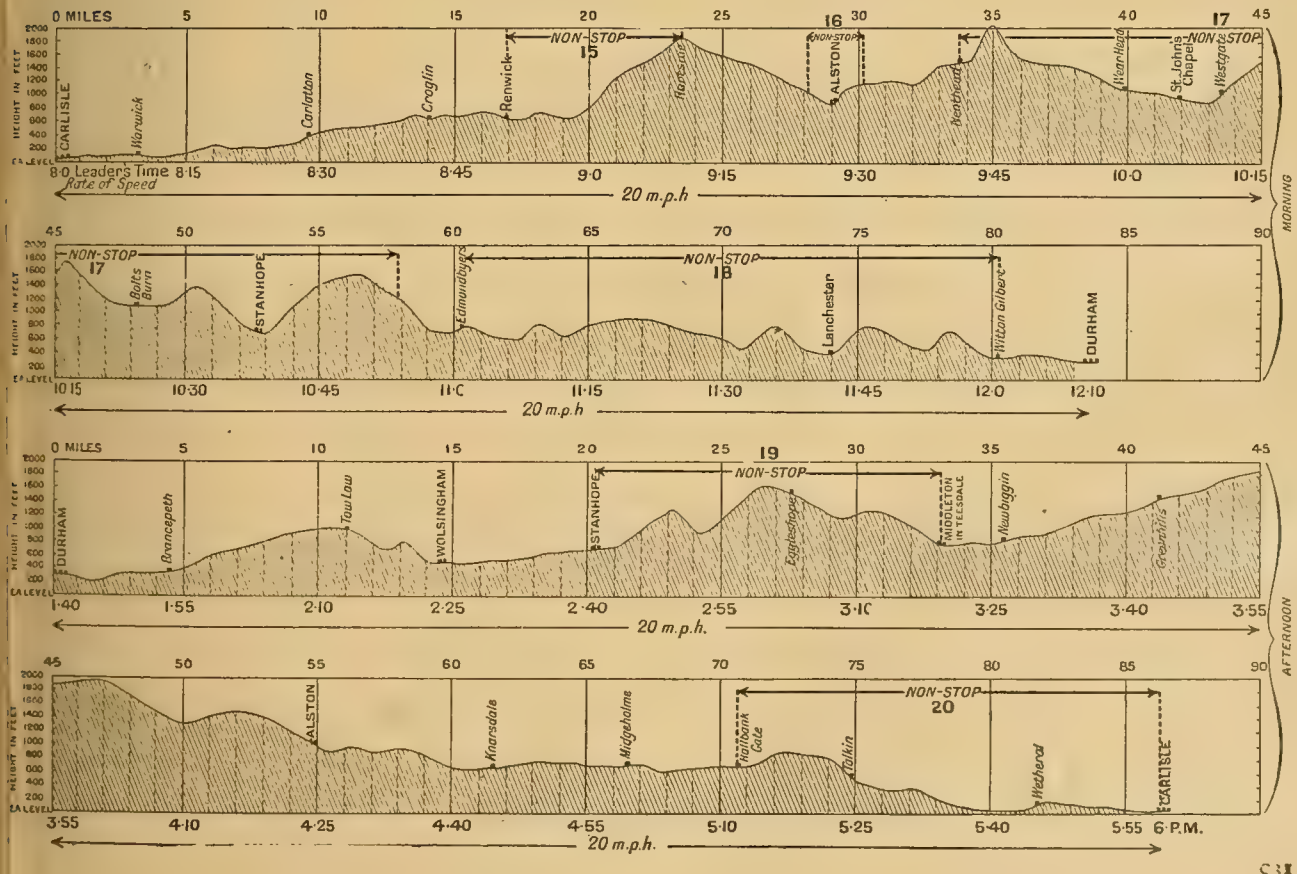
THURSDAY (170 miles.)

ROUTE: Carlisle, Warwick, Carlatton, Croglin, Renwick, **Hartside,** Alston, Nenthead, **Slate Hill,** Wear Head, St. John's Chapel, Westgate, **White Edge,** Bolts Burn, Stanhope, **Horseshoe Hill,** Edmundbyers, Lanchester, Witton Gilbert, Durham (lunch), Brancepeth, Tow Law, Wolsingham, Stanhope, Eggleshope, Middleton-in-Teesdale, Newbiggin, Greenhills, **Grass Hill,** Alston, Knarsdale, Midgeholme, Hallbank Gate, Talkin, Warwick, detour to Wetheral, and Carlisle.

Thursday's work begins with a long rise from Carlatton and short drop into Croglin. On the other side of Renwick a three-mile rise of about 1,100 feet will be encountered to **Hartside,** the top of which is 1,886 feet above the sea; then follows a long drop to Alston—nearly 1,000 feet in five miles. Moorland roads are traversed to Nenthead over **Slate Hill,** 2,056 feet above sea level, the highest point reached in the trials, through Wear Head and into Wear Dale, which is followed to Westgate, where a left turn again brings the riders on to moorland roads, and face to face with a severe ascent past Crook's Altar and over **White Edge,** 1,769 feet above the sea, to Bolts Burn. Wear Dale is regained at Stanhope, but a turn northwards is there made, and more climbing indulged in over Stanhope

and Muggleswick Commons and **Horseshoe Hill.** From Edmundbyers the road is hilly to Lanchester, but easier to Durham, the lunch stop. In the afternoon a rise of about 670 feet from Brancepeth to Tow Law will have to be climbed, followed by a drop to Wolsingham and a run up Wear Dale to Stanhope, where a turn to the left again brings the competitors on to the moorland roads, of which they will by this time have had much experience. A 400ft. rise is first encountered; the road then drops to a ford, rising again over **Bollihope Common** to a height of 1,678 feet above sea level, and dropping through Eggleshope to Middleton-in-Teesdale. From this place the road gradually rises to **Grass Hill,** whence it rises and falls, principally the latter, to Alston. The worst is now over for the day, and the valley is followed through Knarsdale, and so to Midgeholme, Talkin (the end of the fell road), and Warwick, where a detour is made to Wetheral and Carlisle. The feature of this day's run will be the moorland roads at high altitudes and of indifferent surface over the Pennine Range, known as the backbone of England.

The Auto Cycle Union invite the assistance of helpers at different points on the course. Readers willing to assist should write to the A.C.U. Secretary, Mr. T. W. Loughborough, 89, Pall Mall, S.W.



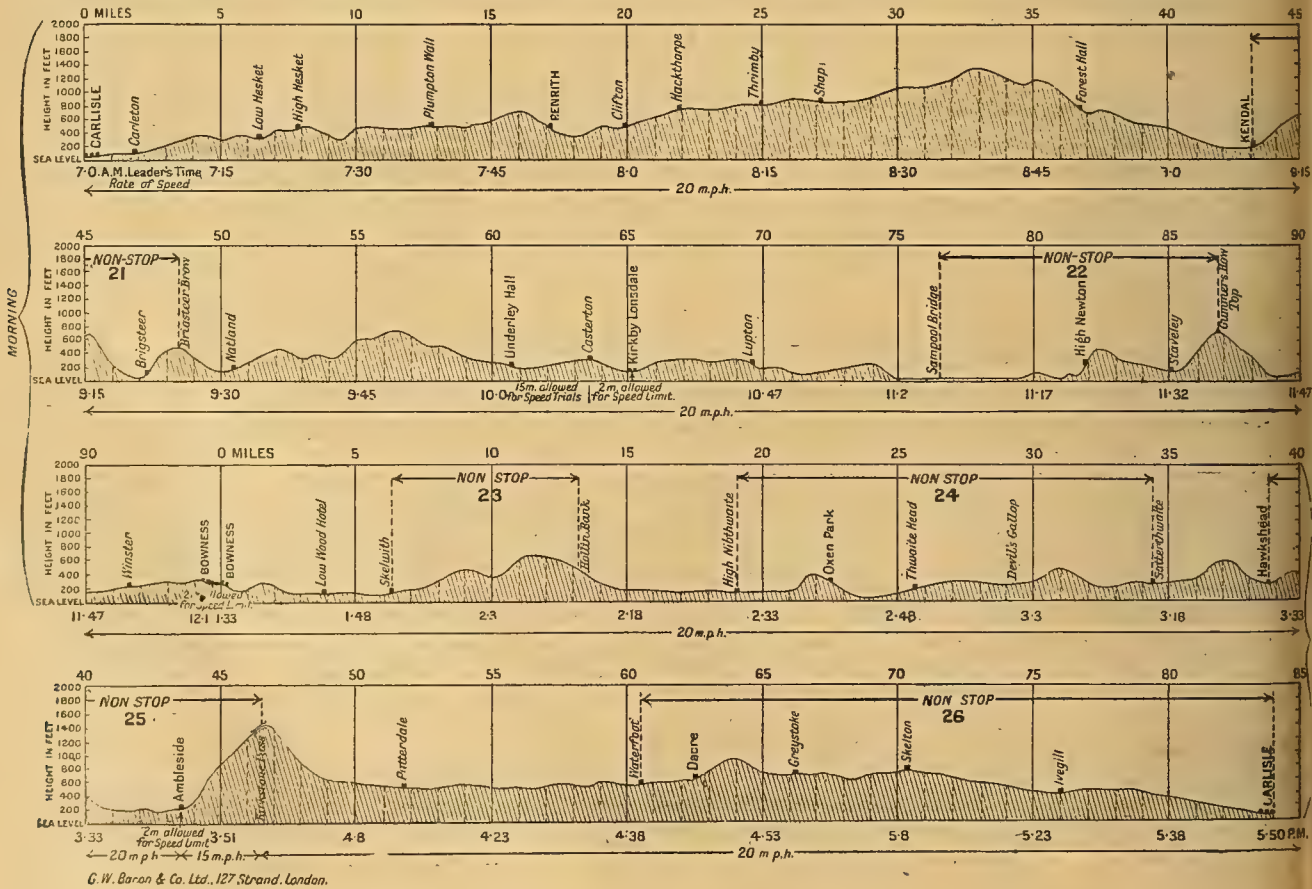
FRIDAY (178 miles).

ROUTE: Carlisle, Carleton, Low Hesket, High Hesket, Plumpton Wall, Penrith, Clifton, Hackthorpe, Thrimby, Shap, Forest Hall, Kendal, Brigsteer, **Brigsteer Brow**, Natland, Underley Hall (speed trials), Casterton, Kirkby Lonsdale, Lupton Sampool Bridge, High Newton, Staveley, **Gummer's How**, Winster, Bowness (lunch), Low Wood Hotel, Skelwith, **Hollin Bank**, Coniston Water, High Nibthwaite, Oxen Park, Thwaite Head, **Devil's Gallop**, Satterthwaite, Hawkeshead, Ambleside, **Kirkstone Pass**, Patterdale, Ullswater, Waterfoot, **Dacre Bank**, Greystoke, Skelton, Ivegill, and Carlisle.

The first ascent of any note is Brigsteer Brow, for although Shap Fell has to be crossed before Kendal is reached, this is no longer the problem that it used to be. The speed trials, which take place on this day at Underley Hall, will be interesting and instructive in view of the hill-climbing and other hard work to which the machines have been put. Though still somewhat rough, the surface of Tow Top has recently been improved. Thus many of the twelve corners have lost much of their difficulty, of which the ninth is probably the most awkward of all. The steepest gradients on the hill are 1 in $3\frac{3}{4}$.

Passing the foot of Windermere, the riders tackle **Gummer's How**, which, in contradistinction to twisting Tow Top, is a straightforward hill, with a lumpy surface but few loose stones. It rises almost 550 feet in a mile. The steepness is felt almost immediately, for there is a gradient of 1 in $4\frac{3}{4}$ quite low down. The lake is regained through Winster, and the stop for lunch is made on its shores at Bowness. The afternoon's run begins with a run along the lake side to Low Wood, after which Hollin Bank is crossed to Coniston Water, the shore of which is followed to High Nibthwaite, and the fells are crossed to Oxen Park. At Thwaite Head there is a maximum gradient of 1 in $4\frac{1}{2}$. The road then returns almost to Windermere, when it bends northward to **Devil's Gallop**, near Esthwaite Water, southward to Satterthwaite, and again northward to Hawkeshead. Nibthwaite to Satterthwaite, being a non-stop section, will require care. The steepest side of **Kirkstone Pass** is the next climb to be negotiated, namely, the precipitous rise from Ambleside. There is a rise of 1,300 feet in two miles seven furlongs. The surface is good as a rule in spite of the coach traffic, but the coaches do not as a rule descend this way and cut up the road with their skids. The steepest gradient is 1 in $4\frac{1}{4}$. This is a stiff proposition, as the Americans say, at the end of 700 miles or so.

After the beautiful ride along the shores of Ullswater, **Dacre Bank** will be the last of the Lakeland hills to be climbed. It is threequarters of a mile in length, and in that distance rises nearly 400 feet, finishing with a rise of 1 in 4. The surface is good, and from the crest of the Bank there is a magnificent last outlook over the mountains of Lakeland, whose heights and intricacies will be remembered by the Trials riders for many a day.



G. W. Baron & Co. Ltd., 127 Strand, London.

LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Is the Three-wheeler a Cycle Car?

Sir,—The reference to Mr. Parnacott's Cycar as a three-wheeled machine in my letter published July 24th is obviously a typist's error, as the machine is well known to be a four-wheeled machine.

For the Hon. Sec. of the Cyclecar Club,
A. C. ARMSTRONG.

Audible Warning.

Sir,—I have just been reading a paragraph by "Ixion" in *The Motor Cycle* for July 17th, referring to "Exhaust Whistles," which, although written in a humorous strain, is unfortunately the grim truth with regard to most of such fitments, and this was the reason why the Klaxon Co., Ltd., experimented for two years with the idea of applying the well-known principles of the patented Klaxon warning signals to a mechanically operated device for the use of motor cyclists, with the result that last June the Cycle Klaxon was placed upon the market.

The Cycle Klaxon is a particularly neat aluminium instrument, fitting on to the girders of the front fork, and controlled by a small Bowden thumb lever and wire.

In operation a friction disc is brought into contact with the rim of the front wheel, causing a ratchet or toothed wheel to revolve at a very high speed within the instrument, making contact with a button riveted to the centre of a chrome vanadium steel diaphragm, the vibration of which gives a prompt, impressive, and penetrating note which can at speed be heard upwards of a mile.

STEPHEN SHERMAN.
THE KLAXON CO., LTD.

A 10 h.p. Singer making fastest time in Class D of the Leicestershire A.C. hill-climb last Saturday.

The Irish End-to-end Trial.

Sir,—In your account of the Irish End-to-end Trial I notice you state I was knocked out through tyre trouble; this is not correct. What happened was, I had the misfortune to run into the stones that were deliberately placed on the road during the night, and was thrown off the machine, injuring my lamp in the fall. I had, therefore, to travel very slowly for about two hours in the dark and could not reach Cork in schedule time. J. ATKINSON.

Formula Results of the Cyclecar Club's Hill-climb.

Sir,—I am surprised to see in your issue of July 24th that you put the results of this club's hill-climb at South Harting under the heading of "*Revised* Official Results." Owing to the cubical capacity of some engines being erroneously stated on the entry forms, and having to be verified, and there were also chassis weights to be tested, it was not possible to issue immediately after the hill-climb anything but preliminary results. I beg to call your attention to a letter sent you on June 30th, enclosing these results, in which it was distinctly stated that "these results are provisional, and have not yet been passed by the judges."

The results which we had the courtesy to send you last week are the *first official results* that have been issued. The only competitor who apparently has been displaced, apart from the entrant whose machine was disqualified, is Mr. J. F. Buckingham, and he knew before the preliminary results were published that he had not the highest figure of merit, the former result being a fairly obvious error.

For the Hon. Sec. of the Cyclecar Club,
A. C. ARMSTRONG.

[Our correspondent is in error. As we pointed out on page 962 last week, in addition to Mr. Buckingham's position being altered from first to second in Class 3, Messrs. Lambert and Spencer change positions in Class 4. —ED.]

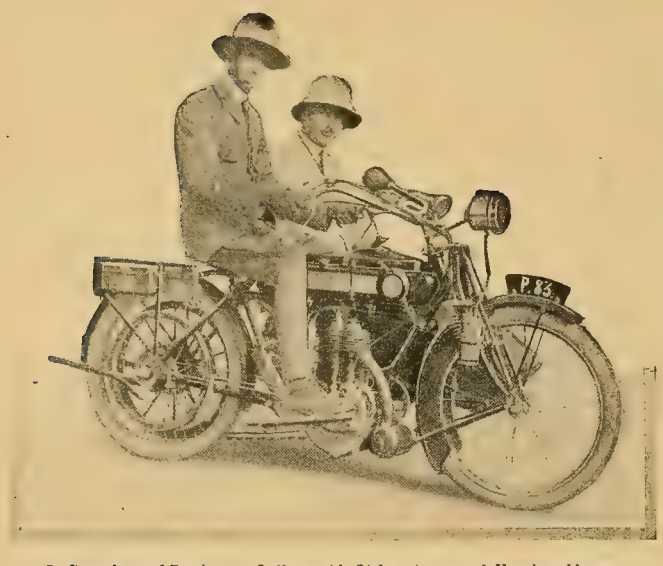
Fair Treatment.

Sir,—Having been a subscriber to your valuable paper for several years now, and seeing lately the comment on fair treatment, I should like to say that recently I had a sidecar connection break, which I returned to the Gloria Cycle Co., Coventry, and asked them to send me a new one to replace. This they forwarded free of charge and by return of post.

F. C. ANSTEY.

Sir,—Recently, whilst on a tour in the South of England, I had the misfortune to experience a breakage in a vital part of my Xl'All saddle, a fracture I must put down to my being a novice with a turn for speed, and running over a bad bump when my speedometer was indicating a velocity well above the limit of the law. Further progress was out of the question until the saddle had been repaired, so I went without loss of time to the agents of the Xl'All in London, Messrs. E. S. Thomas and Co. At their hands I received the most courteous treatment, as they, without referring to the head office, where the saddle had originally come from, repaired it free of charge whilst I waited. I may add that I have no interest in the firm.

H. E. WORTHAM.



C. Gonsalves, of Pershawar, India, on his 3½ h.p. two-speed Humber sidecar on which he recently climbed the Khyber Pass. The approach to the pass is by a road 24 miles in length which rises 1,700 feet. We understand that this is the first 3½ h.p. motor cycle and sidecar to make the ascent.

Glengesh Hill.

Sir,—In view of the photograph of Glengesh Hill, Co. Donegal, which appears in *The Motor Cycle* of the 17th inst., the enclosed drawing may interest your readers. The hill was included in both this year's and last year's Irish Open 24 Hours' Trial, and coming as it does in the wee sma' oors of the morning, after a long night's gruelling it really forms an exceedingly stiff test. I was unfortunately not able to be present this year, but last year I went over to the hill to see the competitors go up. The night was very stormy and wet, and most of the riders arrived at the hill in an exhausted state, and only three or four succeeded in climbing it. Healy's performance on a single-geared 3½ h.p. Rudge was a perfectly marvellous exhibition of skilful riding; he took the two S bends without falter. I was too far away to hear if he cut out, but, judging from the speed at which he came round, I should say not. The steepest portion of the hill is shown in your photograph—it is the part just coming up to the lower hairpin bend, and is 1 in 3.6. Just at the bend on the inside, it is, of course, much steeper.

To my mind, however, the most meritorious performance on the hill was that of Hugh Gibson with a 3½ h.p. Bradbury and sidecar with passenger, fitted, I believe, with Sturmey-Archer three-speed gear (the bicycle of course I mean, not the passenger). He *almost* made a perfect climb, took the hairpins in fine style, but just when about 150 yards from the top his engine showed signs of faltering, and he had to hop off and run alongside for about twenty yards until the engine picked up again, after which he sailed merrily to the top. After this the rank and file began to arrive with conking engines, and had to be assisted to the top. It is no light task to shove a 3½ h.p. single-geared machine up 1 in 5.

One incident of the day I have not seen mentioned in any account of the run. The doctor in Ardara most kindly sent his man to the top of the hill armed with a large bottle of the "juice of the country," and this was very much appreciated by both competitors and assistants after pushing machines up the hill.

The climb itself took place in more or less fine weather, but soon afterwards the rain came on again heavily, and those competitors who went on and completed the run certainly earned their medals. IH 94.

Simple Tip for Amateurs.

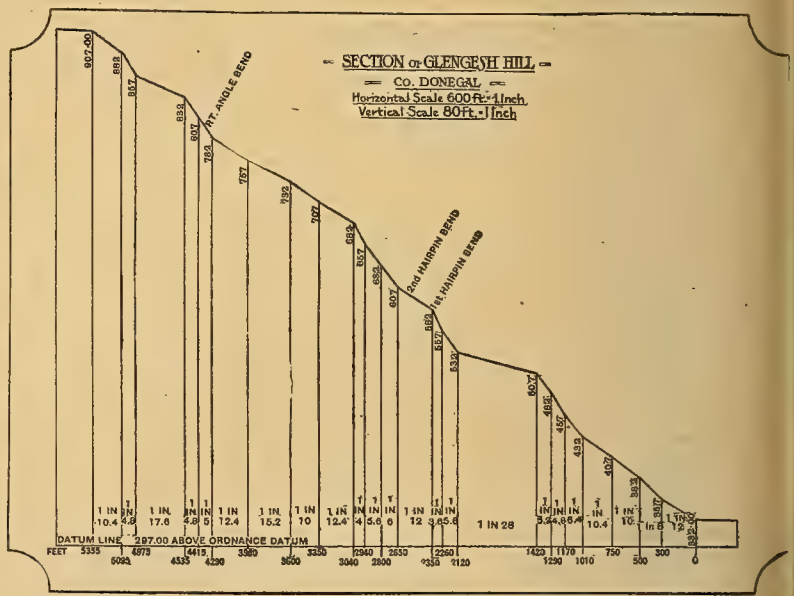
Sir,—Referring to the article by "Ubique," the one showing the making of paper washers for crank case and cylinder, although extensively practised, is not to be recommended, particularly to beginners who do not realise the force of a hammer blow.

I have actually come across several cases of the flanges being burred up so that the addition of the washer would not form an oil-tight joint owing to the cylinder being prevented from seating correctly. A sharp tap with the hammer penetrating the paper soon burrs up the sharp edge, and, for this reason, to use a file and erase the paper, although probably taking off the corner slightly, is far preferable.

While on the subject of tips, I would like to mention one which has proved useful on several occasions; it is a comparatively common occurrence for the nipples on the exhaust cable to come adrift through the chafing of the wire next the nipple. This has happened to me, and I mended it in the following manner: Cutting the ends of the inner wire clean and taking about half an inch off the outer covering I tied a piece of wire round the inner cable, about a quarter of an inch from the end, and then doubled over the strands and again tied the wire round, twisting it fairly tight with the pliers. This made a really good nipple, so good that I have not taken the trouble to alter it. A. BULL.

Dr. Low's Formula.

Sir,—Dr. Low has replied to his critics. As mistakes were made in working out the results some of the criticism was unfair, and as one of the critics I apologise. But surely the fact that such mistakes occurred and were not at once detected condemns the formula as too complicated for every day use. A formula not easily understood by the people or even by the majority of club secretaries, labours under grave disadvantage. The man in the street should be able to verify results for himself. He will not always trust the experts. Also, I should like to ask Dr. Low this question. Suppose that the G.N. (I won't mention the Morgan) has taken 98 lbs. ballast to equalise weights, in what time must it have climbed South Harting hill in order to beat the Cycar? The time taken by the Cycar was, roughly, four minutes, and, after subtracting the constant 200, the cylinder capacity of the G.N. was about three times that of the Cycar. Therefore, if T = time required, the equation $\frac{W}{31 \times T^{1.75}} = \frac{W}{12 \times 41.75}$ will give the answer. My mathematics are rusty, but I make the answer to be about 68 seconds, which is obviously impossible. Can Dr. Low correct these figures appreciably? H. GEORGE MORGAN.



Family Sidecar Outfits in the West Country.

Sir,—I herewith send you a photograph showing the way exes are used as waggonettes in the hilly West Country. he four Rex Sidettes shown carried thirteen people, in- uding tent and camping outfits. H. HOLMES.

Photograph accompanying Mr. H. Holmes' letter.

Benzole.

Sir,—Mr. Robinson's letter in your issue of July 17th makes my mouth water."

300 miles with sidecar on 3½ gallons of benzole sounds nderful. I also was touring at Whitsuntide out in N. ales. My consumption of Shell for 370 miles was nine llons, with sidecar of course, but only nineteen stone of ssengers. Would benzole show to such an advantage on two-stroke as it apparently does on a P. and M.?

C. S. BIRT.

ou cannot expect to improve your consumption more than 20% by the use of benzole.—ED.]

Sir.—In reply to your correspondent "B 1117," I write tell him and other users of Douglas machines that I have d benzole and find that on exactly one measured gallon this fuel I cover 172 miles at an average speed of 23 .h., and that under only fair atmospheric conditions; s was on a two-speed 1913 model with a Douglas car- retter. I have been told that with benzole the engine is lined to overheat; my experience is that it does not over- at an engine any more than petrol. I have fitted a smaller for benzole, and with this the engine will take a little re air than with a medium jet and petrol. With benzole engine will start, when warm, quite as easily as with rol, but when cold one has to walk about six steps instead two. If any user of a Douglas ever suffers from misfiring either cylinder, and if all four tappet rods and all four ve stems are working freely in their guides, the trouble almost certain to be an air leakage at the induction pipe. e should then wrap each end with insulating tape, and n it is a hundred to one that the misfiring will be cured.

A THREE YEARS DOUGLAS RIDER.

Tyres and Accessories in the T.T. Races.

Sir,—I should like to reply to Mr. Gordon L. Fletcher's ter in your issue of July 17th.

Like "H.G.L." on July 3rd, I was interested in the letter the Palatine Rubber Co., and felt that the question so cerned the ordinary rider, that no harm could be done hearing all sides through the columns of your interesting per.

am afraid Mr. Fletcher has missed my point. If he ers to my letter he will note I distinctly stated "some" n. It is not to be supposed for a moment every com- itor would be so foolish, but the fact that a few would so, if the inducements were tempting enough, introduces o the race a grave element of danger, not to themselves y, but to other competitors. I am not finding fault with e manufacturers who offer *prizes* to the winners using ir productions—that is perfectly legitimate and fair. complaint is the *wholesale subsidising of competitors*, various ways, whether they win or lose.

I am as fully aware as Mr. Fletcher of the huge expense any entrant for the T.T. has to face, and cannot blame, in a sense, any competitor who obtains assistance if he can. It is a serious problem, and one which will have to be faced.

I cannot agree with the remark that I show considerable bias in my preference for British made tyres; I said there were many British covers of far better quality than foreign ones, and I am prepared to prove it, and because I prefer to be patriotic I fail to see where bias comes in. I differ with him when he states that other makes had an equal chance. They *would* have, if the makers were prepared to subsidise competitors in the same manner as the foreign firms in question.

My point is, that if a firm of tyre manufacturers is able, by monetary inducements, to get the majority of competitors in a race to use its goods, any result it obtains is fictitious. That is my personal opinion, and is shared by others.

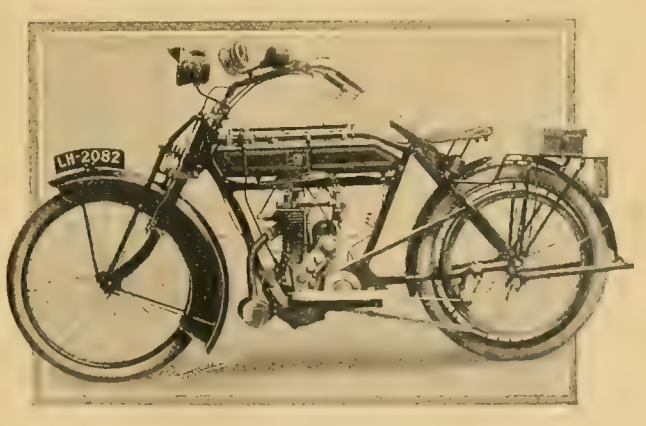
I may say I am not interested in any tyre company, or motor cycle business, beyond being an enthusiastic motor cyclist of thirteen years' experience, and one who has attended all the T.T. races for pleasure and sporting purposes only. FURTHER INTERESTED.

Falls and Footrests.

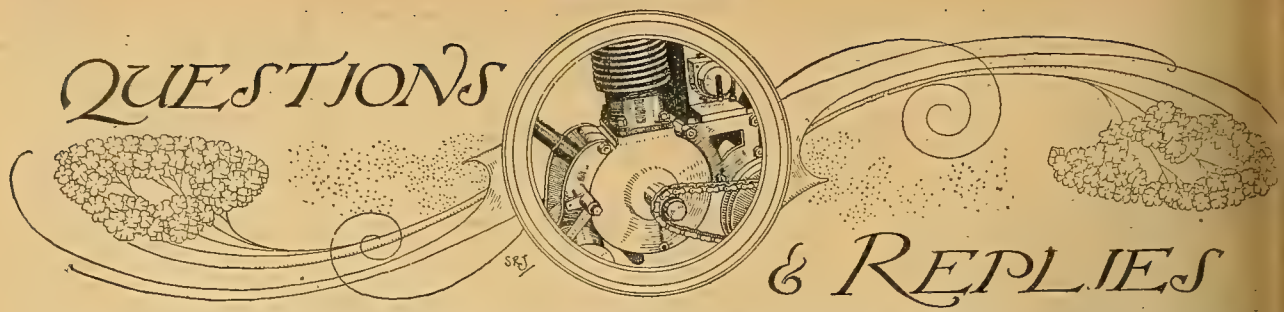
Sir,—I read "Ixion's" remarks in *The Motor Cycle* of 10th July, *re* his annual tumble, with interest, more especially as I was suffering from the effects of one taken on the 5th inst. When I descend from my machine hurriedly over the handle-bars I always try to roll. On the 5th I succeeded nicely, and should have escaped damage, but unfortunately I was carrying a couple of spare belts, and had stupidly coiled them round my waist. These belts seem to have been crossed behind my back, for as I rolled they hit me across the small of the back, getting well home with a beautiful "kidney punch" every time. I believe this punch is now illegal in boxing and am not surprised.

Owing doubtless to the fact that a well known rider, who should have known better, carried in the T.T. race, tools, etc., round his waist, this practice seems to be fairly common, and I think you might draw attention to the danger or annoyance it may cause.

"Ixion's" remarks *re* footrests were also excellent. There is one point, however, he did not mention. That is the absurdity of attaching controls, brakes, etc., to footrests. Every experienced rider knows the advisability of having his rear brake control clear of the footrests and manufacturers should know also. The actual T.T. machines are made with controls attached separately, but there are numerous 1913 machines with rear brake pedal attached to footrest. Climbing Amulree in a recent competition, I skidded on the first bend; my inside footrests struck the ground, but I somehow managed to keep going and found my wee 2¾ Douglas had averaged over 30 m.p.h. I did not think anything about it; but while descending I found my rear brake useless, and had difficulty in slowing sufficiently by braking with my feet on the ground, to get round the corners. I would like to suggest that the A.C.U. should debar all 1914 machines with controls attached to footrests from taking part in any competition held under its rules. If this were done *now* manufacturers would have no excuse in 1914. A.B.



The Armstrong—a standard design of motor cycle, embodying the 2¾ h.p. Villiers power unit.



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Adapting Carburetter for Benzole.

I am thinking of using benzole on my 1913 6 h.p. A.J.S. Would you kindly answer the following questions? (1.) Would the carburetter (Amac) require to be especially adjusted; if so, how? (2.) What sized jet should be used?—J.S.O.

(1.) You might have to weight the float slightly. (2.) This can only be found out by experiment. Probably you will find that the machine will run without any alteration at all. On the other hand, you may, in addition to weighting the float, have to get an extra air inlet.

Machine Catching Fire.

I have a 3½ h.p. motor cycle which caught fire. Can you tell me the cause? It caught fire as I was attempting to start it on the stand. There has been a leakage of petrol into the lubricating oil; would this have caused it? I failed to put the fire out with water, and in case I have a similar occurrence, which is the best way to put it out?—J.D.

Probably the fire occurred through the inlet valve sticking up and the charge blowing back through the carburetter. It could not well be caused by a leakage of petrol into the lubricating oil. The only thing to do with a petrol fire is to smother the flames, either with a cap, cloth, sand, or use a chemical extinguisher. Do not, of course, use sand if you can possibly help it.

Steering with Sidecar.

I have a motor cycle with sidecar attached (rigid type), but, although it is apparently connected up with both bicycle and sidecar wheels perpendicular and parallel, I find the greatest possible difficulty in turning a corner to the left. The apparent tendency to fall outwards is such as to make turning corners or passing other vehicles when there is any camber at all on the road a veritable nightmare. I should be very glad if you could give me any hints as to the best method of getting over this trouble.—E.S.

Without actually seeing the machine it is almost impossible for us to tell what is the matter with it. You should carefully test the alignment with the aid of a straight piece of wood and a vertical setting of both motor cycle and sidecar with a plumb line. Provided the alignment is correct and the sidecar is properly attached to the machine, there should be no appreciable tendency to lean outwards. Take the machine to your local dealer and he will probably fix it up for you in a few minutes.

A Question of Wear.

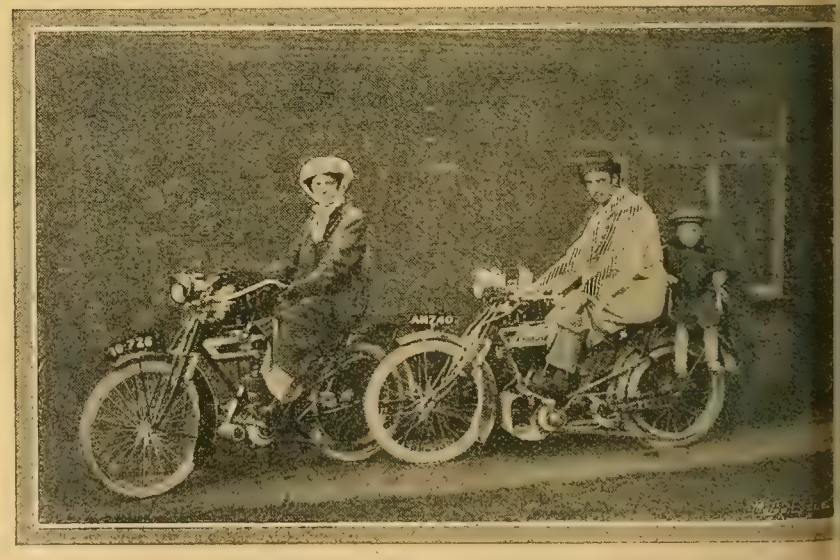
(1.) How far should an engine run, with roller bearings to both ends of the connecting rod, without attention to connecting rod bearings (with sidecar)? (2.) What is the usual life of the gear wheels driving the magneto from the engine? (3.) Which end of the connecting rod should be the quicker to wear? (4.) Are pistons with one ring at the top only satisfactory?—J.F.D.

It is difficult to give you any approximate idea how long the roller bearings will wear. Properly lubricated, they should not need any attention for ten or fifteen thousand miles. The life of gear wheels driving a magneto can be safely taken as being equal to the life of the engine. The small end of a connecting rod is most likely to wear first, as it may not get such good lubrication as the big end. The piston you mention can be taken as satisfactory, though two rings will probably give better service.

A Taxation Question.

I should appreciate replies the following queries: (1.) I ha bought a motor cycle (parts) a assembled machine, but not succeeded in making it go m than a few yards on a private ro Ought I to register and pay the t seeing I may eventually fail and ha to scrap it? (2.) I fancy a 2¾ h.p. o frame Douglas; would this be up thirteen stone? (3.) I prefer to enj scenery and throttle down to 12 a 15 m.p.h. for long stretches. this slow running harmful? Believing large belts to be m economical, is there any harm in fitti a 2¾ h.p. with pulley and belt rim 1in. or 1½in.?—Opoponax.

(1.) The point is a knotty one, but believe that you need have no licen until you leave the private road. however, there is a public right of w over the road, this will probably al the case. (2.) The machine you ment would be quite suitable for you. There is no harm in running slowly. 1in. and 1½in. belts would waste a lot power on so small a machine. We wo not recommend anything above ¾in. the machine in question.



MARRIED COUPLES WHO MOTOR CYCLE.

Mr. and Mrs. L. C. Rumens of Cranbrook, Kent, and their mounts — a 3½ h.p. Zenith and a 2½ h.p. three-speed Premier. Incidentally Mr. Rumens mentioned in a letter that he has never missed a number of "The Motor Cycle" since 1903.

The Law and Licences.

I should be much obliged if you could answer the following questions: (1.) Can a policeman stop you to ask to see your licence? (2.) Is he entitled to ... any more than just see you have ne, *i.e.*, can he take it out and examine ? (3.) For what offences can your cence be endorsed?—A.S.G.

A policeman in uniform is entitled stop a motorist at any time at his ction, and ask to see your licence, ch you are bound to produce on and. (2.) The law does not compel to hand your licence into the hands the policeman, nor is he entitled to mine whether it has any endorsements the back; but it is sufficient that he that you have it, and that its date es it valid. (3.) Your licence can endorsed for any offence for which are convicted under the Motor Car of 1903, except for exceeding the d limit -first offence—and for not ing a tail lamp alight.

Touring in France.

I should be glad of the following information: An outline of my way from Southport to London; main towns *en route* will suffice. London to Dover d time of boats to Calais; and Calais Paris and mileage. Are there any xes to pay, and has petrol to be ken out of the tank at Dover? Any lvice you can give will be most accept-le.—W.T.

r best route would be as follows: hport, Ormskirk, Preston, Rainhill, cot, Rainford, Warrington, Tar-ey, Nantwich, Woore, Pipe Gate, e, Weston, Rugeley, Lichfield, along ling Street, through Atherstone, entry, Weedon, Towcester, Fenny ford, Dunstable, St. Albans, London. not take your machine from Dover Calais, but from Folkestone to ogne, as they are more accustomed andling motor bicycles by this route, the sea journey is only half an hour r. Boats leave Folkestone at 11.55 and 4.10 p.m. All petrol has to be emptied out of the tanks. You have to take out an international pass, which is obtainable from the Royal Automobile Club (89, Pall Mall, S.W.), or the Automobile Association and Motor Union (Fanum House, Whitcombe Street, W.). It would be advisable for you to become a touring member of the Auto-Cycle Union (89, Pall Mall, S.W.), which costs but 5s., and they will obtain this pass for you through the R.A.C., and help you considerably as regards your tour. They also issue a special customs card admitting the machine into France free of duty.

Taking Machine to Australia.

I am anxious to take a second-hand motor cycle from England to Australia. Will you kindly advise me—(1.) If it can be shipped as personal effects. (2.) If the machine must be freighted and the cost of same. (3.) Are second-hand motor cycles admitted into Australia duty free? (4.) How long must a motor cycle have been used to be regarded as second-hand? (5.) If there is any duty on second-hand machines, what percentage on value is charged for same? (6.) What is the duty on new machines imported into Australia? (7.) What would be the best and cheapest method of packing and transmission of a motor cycle from Stockton-on-Tees to London and thence to Australia?—S.S.A.

(1.) No, we do not think motor bicycles can be shipped as personal effects. (2.) The cost of collecting, packing, and sending the machines to Australia from London would be about £2 7s. (3.) Second-hand machines pay duty according to their value. (4.) If you use the machine for a week or two, we should say it would count as a second-hand afterwards. (5 and 6.) The duty is reckoned at 25% on the value if of British manufacture; 30% if of foreign manufacture. (7.) We should recommend you to get into communication with Messrs. Davies, Turner and Co., Ltd., International Carriers, 52, Lime Street, E.C. You had better send the machine by rail and get it collected at the station.

Loss of Power.

I have a second hand 1910 3½ h.p. Quadrant, magneto ignition. It has lately shown a marked falling off in power when hills are reached. The machine gets very hot over the exhaust valve; in fact, red hot after a good run. When I stop, after a run of, say, eight miles, smoke issues from the crank case, coming out around the pulley and the joints; it also blows out a little when going. Even when I get off and run with it there seems scarcely enough power to take the machine up the hill; this is after it has been running for a few miles. There are practically no signs of it firing past the piston, but I can put the cylinder over the piston rings without pressing them in their grooves at all. I have a No. 30 jet on, and can give more air than throttle when on the level.—W.M.

The trouble is probably due to too weak an exhaust valve spring, or the exhaust valve not having sufficient lift. Also see that the cylinder head and piston are clear of carbon deposit. If the engine is suffering badly from overheating you should immediately take steps to discover the cause. From what you say about the piston rings, it seems as if these ought to be renewed. The carburetter adjustment seems to be about right.

READER'S REPLY.

Decompressors and Easy Starting.

I notice "W.M.P.'s" query *re* decompressor on 3½ h.p. Hobart. I have a 3½ h.p. Hobart 1912 three-speed and side-car, and find an Endrick decompressor a great advantage, being able to take the machine out and start up at a walk when cold. I think "W.M.P." would not regret fitting one.—J.H.C.

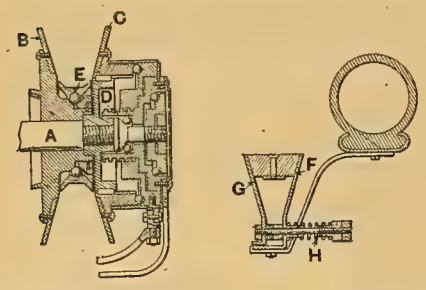
If "H.H.W.," "F.N.G.," "E.F.," "E.F.W.," "G.D.," "G.W.L.," "W.H.W.," "A.E.K.," and "R.E.M.," will conform to our regulations and send a stamped addressed envelope, they will receive a reply to their questions.

AN INCIDENT OF A LONG DISTANCE RELIABILITY TRIAL.

Competitors, too early, are waiting outside a check. The village is Colsterworth, near Grantham, and the competition the Bradford M.C.C. team trial from Bradford to London and back.

An Expanding Pulley Gear.

This gear is of the type in which the engine crankshaft A has fixed to it one pulley flange B, whilst the other C can be adjusted towards or away from the flange B to vary the effective pulley diameter. This is brought about by moving angularly the screwed sleeve D by means of a control lever arranged at the side of the machine. At E is a ball



bearing ring, upon which the belt rests when the pulley is fully expanded, so that the engine may then run free. To take up the slack of the belt the rear pulley is caused automatically to contract. The flange F of the rear pulley is fixed, but the flange G can move away from the flange F when the belt becomes tight. When the belt is slack the pulley flanges move towards one another by the action of the springs H.—F. W. Peterson, No. 25,901, 1912.

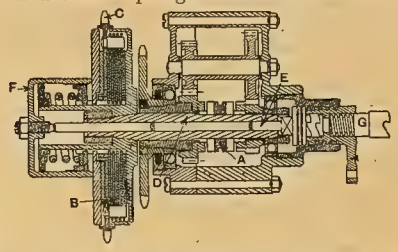
PATENTS

BY

ERIC W WALFORD. F.C.I.P.A.

A Countershaft Gear.

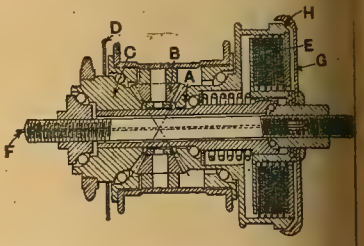
The change speed gear is of the lay shaft type, and the dog clutch A is moved to the left for the top speed and to the right for the reduction. Outside the gear box is arranged a plate clutch B which normally clutches the sprocket C (by which the power is transmitted from the engine) to the driving-shaft D. By moving the rod E to the left the casing F and clutch spring are also moved to the



left and the clutch is released. This is effected by moving the arm, which is fixed to a screw device through which passes a short starting-handle shaft G, which engages the clutch-actuating rod E at a point where this has a non-circul action with the driving-shaft D. T chain sprocket on the engine-shaft driven through a slip device.—E. Jardi and E. Watchorn, No. 11,529, 1912.

A Two-speed Gear and Clutch.

The gearing is of the bevel type, co prising a sun pinion A, planet pinio B carried by the hub shell, and a drivi pinion C attached to the driving slee which carries the belt pulley which



attached to the disc D, and also t pedalling chain sprocket. When the pla clutch E is engaged the gear revolves a solid mass, but by drawing the rod to the left the clutch is disengaged a the disc G is also moved to the le giving the free engine position. further movement of the rod F to t left the conical surfaces at H are brou into engagement with one another so th the sun pinion A is held stationary a the hub driven through the gearing L. Lamblin, No. 25,265, 1912.

Benzole in Oxford.

We are informed that benzole may be obtained in Oxford at the Morris Garage, Longwall Street. The proprietor of this garage Mr. W. R. Morris is well-known in connection with the Morris-Oxford light car.

Mabon's New Address.

Messrs. Mabon Motor Works, makers of the Mabon Controllable Pulley, have changed their address from 34, High Rd., North Finchley to 29a Woodside Gardens, Bruce Grove, Tottenham, N.

Gears for Cycle Cars.

Messrs. A. W. Wall, Ltd., Hay Mills, Birmingham, whose Roc gear on motor cycles has been so well known for a number of years, have now produced a gear on the epicyclic principle, embodying two speeds forward and a reverse, which is built specially for cycle cars. The gear set can be supplied either in conjunction with a differential back axle and shaft drive, or for use with a combined chain and belt drive, and should prove a useful set for cycle car makers in want of this particular type of gears.

A Trip by Cycle Car.

Mr. P. Maas, of the Swift Co., has recently accomplished a journey of 3,235 miles on a Swift cycle car without any mechanical trouble. His route was from Coventry, through London, Folkestone, Calais, Lille, Amiens, Dieppe, Havre, Trouville, Caen (where a steep hill was climbed without a falter), Cherbourg, St. Brieuc, Brest, Paris, Brussels, Utrecht, Amsterdam, Arnhem, Rotterdam, Hull, and back to Coventry. The longest day's run was 156. Both the Swift cycle car and its Dunlop tyres, we are assured, were in perfect condition at the end of the trip.

SPARKLETS

Gears in the T.T.

Messrs. Philipson and Co., the makers of the Philipson automatic governor pulley, desire us to state that the only machines fitted with their standard type pulley in the Tourist Trophy Race were the three Rovers which won the team prize.

Tyre Successes.

In the Spanish Tourist Trophy Race, the result of which was published in our last issue, the winner, F. A. Applebee (Scott), and T. E. Greene (Rudge), who was third, both used Continental tyres.

C. F. Halsall's 8-10 h.p. Wilton light car, which won Class D (powerful motor cycles and sidecars and cycle cars) in the Hertfordshire M.C.C. 100 miles half-day reliability trial, speed test and hill-climb, July 19th, was fitted with Clincher tyres.

An Echo of the Grand Prix.

It is interesting to note that the first three riders in the 350 class in the Grand Prix used M.A.G. engines, and also Enfield gears, which are now being placed on the market to be sold as a separate fitting. Enfield gears, whose worth has long been known, certainly scored a signal success in this the most important motor cycle road race held in France.

Brisk Demand for Sidecars.

Another indication of the prosperity the sidecar trade is the experience Messrs. Mead and Deakin. Two ye ago they were making one sidecar week; now they have their fine new wo at Tyseley, are employing ninety han and this year's output will exceed 3,0

A New York motor cyclist who wis "to take off his hat to England and t great British producers of the A motor cycle" writes that he sent for so spare parts for his Ariel, which, arrival, fitted perfectly. He also s that he is able to run away from mot cycles of higher power than his own.

Popularity of Xl'All Saddles.

The new premises of Xl'All, Ltd., H Green Works, Birmingham, which w taken over last week, are an instance the popularity of this original type saddle. Five hundred saddles are t present weekly output of the compa but as the sales of 1913 are 1,200% advance of 1911, readers can appre the need for the works extensions.

Featherweight Pistons.

Whatever the merits of steel as c posed to cast iron for pistons for ord ary use, there is little doubt that racing or fast riding, when a very lig and strong piston is required, steel a great deal to recommend it. T Oxygen Welding Works, Ltd., Sum Lane, Birmingham, make a specialit supplying steel pistons for motor cycl and we learn that the recent succes obtained by A. B. Wade at Caerphi and Porthcawl on his Zenith we achieved with the use of steel piste supplied by this firm. These pistons a known as the Simplex patent feath weight steel pistons.

Beldam Side Grip for Side Slip.

The deep clear cut "V's." give a splendid side grip for side slip. You ride on greasy roads and take sharp corners with the utmost confidence. Quality of workmanship and materials is of the very best.

ENDURING RELIABILITY OR PROHIBITED SPEED

Reliability is the first and last essential of a touring motor cycle. It is, coupled with efficiency, the first and last demand of the great majority of motor cyclists. The greater its reliability and efficiency, the more desirable the machine.

Speed is a secondary factor with motor cyclists who ride for pleasure. As long as the engine is capable of developing a good turn of speed when desired, power on hills and enduring reliability are the first and principal need.

A motor cycle built more for speed is quite unsuited to hard road conditions. It cannot withstand the severe strain for any length of time. Such a machine is too "highly strung"—the mechanism is too delicate—it requires skilful handling and constant attention in order to be free from endless trouble. And it is efficient in one respect only—roaring speed, which serves no practical purpose, is dangerous to life and limb, and is prohibited on the broad highway.

Again, like a speed machine, the sensation of mercurial travelling is short-lived; hence the limited demand for this class of machine. We say "limited demand" advisedly, because certain manufacturers have mistaken the public demand, and have heavy stocks of motor cycles on hand for which there are few buyers, and which are offered at reduced prices.

We have concentrated our knowledge and attention in producing a motor cycle fit for **all** roads and conditions—home and colonial—with power to take the stiffest hills, strength to withstand the hardest usage, efficiency and reliability to render a completely satisfactory service without hesitancy.

Our efforts have been rewarded with unqualified success—evidenced by the unbroken successes of the L.M.C. in hill-climbing contests, in endurance trials, in petrol consumption tests, and, finally, in the greatest of all tests—the service of the private owners, all of which express their delight and appreciation of the splendid behaviour of the L.M.C. on all occasions.

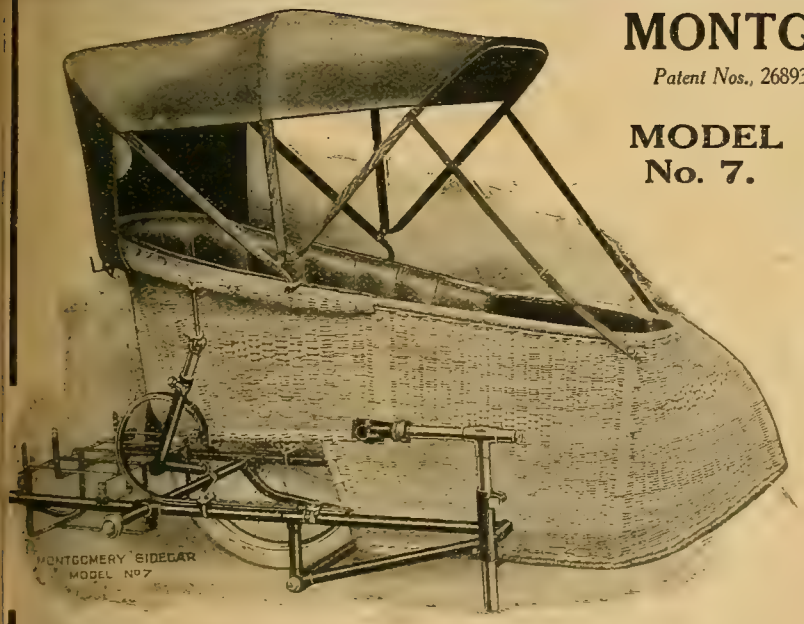
MONTGOMERY SIDECAR

Patent Nos., 26893/10, 26894/10, 26895/10. *Prov. Patent*, 24482.
Regd. Nos., 610486, 610485.



MODEL No. 7.

This is an entirely new model, produced in response to numerous enquiries for a sidecar of light construction for use with the standard 3½ h.p. motor cycle, but strong enough for hardest work, and which can be driven with confidence at the highest speed. Our registered design frame has enabled us to do this, and we strongly recommend it.

SPECIFICATION.—Code Word, "STATING."

CHASSIS.—New model register design girder frame, giving a wide margin of strength for use with machines capable of high speeds. Made of finest quality weldless steel tubing. Extended at back for luggage.

SPRINGS.—Double leaf "C" springs, finely tempered and enamelled black. Front of body supported on our well-known patent transverse foot spring.

BODY.—New pattern best quality wicker, with deep seat and ample leg room, providing most comfortable riding. Upholstered, in best style and material, red, green, or tan to order. Complete with cushion and coverall apron in motor twill.

WHEEL.—26 x 2¼in., black enamelled rim, specially strong dustproof hub, axle turned from the bar. Michelin beaded-edge motor cycle tyre, or to order.

MUDGUARD.—Large size, brought well down over the wheel, and firmly secured to the frame.

ATTACHMENTS.—New patent quick-detachable attachments, provided with double security locks and our latest type of back fitting, which enables the axle to be adjusted in perfect alignment with the ground.

LAMP BRACKET.—Fitted on frame in front of mudguard.

FINISH.—Best black enamel, or colour to order. Usual parts heavily plated.

WEIGHT.—About 78 lbs. **WIDTH.**—37in. overall, but will pass through 34in. doorway.

Price £12 0 0 as Specification.
„ £15 5 0 with Coach-built Body.
„ £15 5 0 with Art Cane Body.

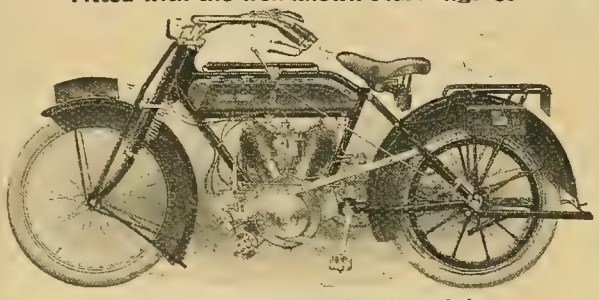
ROYAL RUBY

Fitted with the well-known J.A.P. Engines.



Copy of Unsolicited Testimonial.

The Manchester Wheelers' Club,
June 20th, 1913.

Dear Sirs,

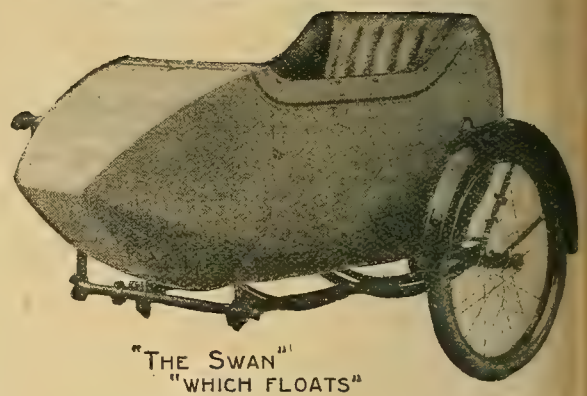
"In January last, I purchased from you one of your Royal Ruby 6 h.p. Models, with Coach-built Sidecar. I have now run considerably over 7,000 miles with this, and should like you to know how extremely pleased I am with it. I have never had a mechanical stop on the road, and could almost say never a misfire. It is the finest machine I have ever had the good fortune to ride, and I may say I have been riding motor cycles for over twelve years. If speed is wanted, well! 50 with sidecar and passenger, and 65 solo should be enough for most people, it is for me, and I can drop to 5 miles per hour on the top gear if necessary. It will be a pleasure to me to recommend your machines to any friend of mine, and if this letter is of any use to you, you have my permission to make what use of it you like. Thanking you for your courtesy to me in all our dealings, I am, Yours faithfully,

F. CURRIE."

Manufactured by

THE ROYAL RUBY CYCLE CO.,
RUBY WORKS,
Cannel Street, ANCOATS, MANCHESTER.

"THE SWAN."



"THE SWAN"
"WHICH FLOATS"

Because you have purchased a motor cycle with a good name, this does not necessarily justify your looking to the makers of that machine for your sidecar attachment. The design and construction of that motor cycle monopolised their every effort, their craft—their sidecar was an after thought with them—its construction a secondary consideration.

Does it not stand to reason, therefore, that we, who have devoted our whole time and thought to the production of the one thing—a perfect attachment—can in turn give you a sidecar that carries with it as good a name as does their motor cycle?—but the "Swan" bears out the truth of this statement.

Price of Sidecar £13 - 10 - 0.

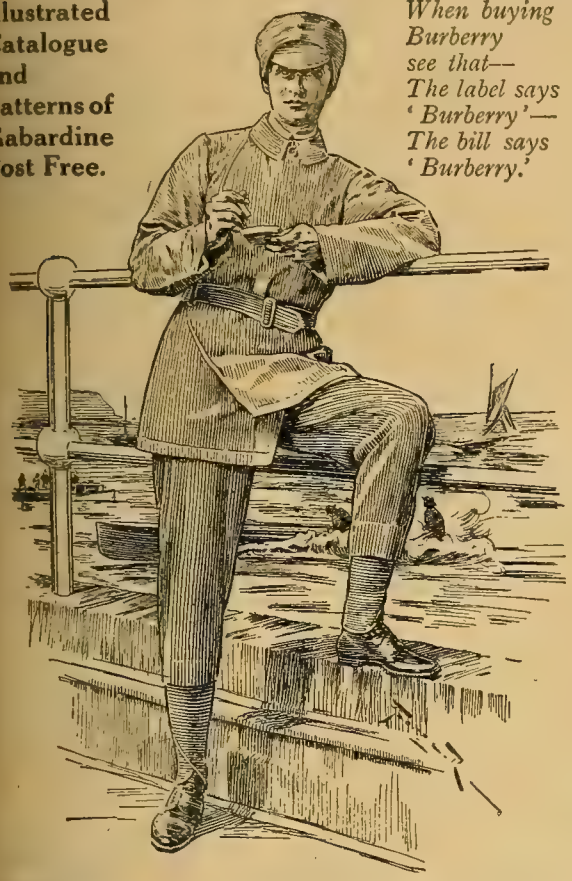
BURBERRY
TIELOCKEN COAT.

Illustrated Catalogue and Patterns of Gabardine Post Free.

When buying Burberry see that—The label says 'Burberry'—The bill says 'Burberry.'



BURBERRYS LATEST INVENTION for the Motor Cyclist or Motor Boatist—a double-breasted, buttonless coat, designed to provide unequalled security and comfort under the severest conditions.

BURBERRY WEAVE-PROOF GABARDINE, lined with proofed wool or camel-fleece, makes the Tielocken Coat a perfect safeguard against driving rain, chilling wind, dust, or spray.

LIGHTWEIGHT, YET WARM, Burberry Gabardine provides efficient protection against the worst weather vicissitudes, yet ventilates like ordinary cloth, thus preventing all danger of overheating or chill.

THE TIELOCKEN COAT, fastened with single strap-and-buckle, is easily put on or taken off. Worn with Trouserettes of Gabardine and Tielocken Gaiters, it supplies the finest protection available against the ill effects of exposure to wet or cold.

TIELOCKEN DUPLEX PROTECTORS, an application of the same principle, provide a four-fold yet airy safeguard of proofed Gabardine and proofed wool for keeping the knees and thighs dry in the heaviest rain.

PRICES: Tielocken Coat in Gabardine, lined proofed wool, 63/-; Gabardine Trouserettes, 31/6; Protectors, 15/-; Motor Cycle Cap, which can be readily transformed into a snug-fitting helmet, 15/-.

The Question of Hub Gears.

THE question of a change-speed device on motor cycles is one of paramount interest, and finality in design of this part of their construction is certainly far distant. Probably the most popular type in point of numbers fitted is the epicyclic ar in the hub. These gears really came into promi nce after the T.T. Race and Six Days' Trials of 11, where they came out, generally speaking, with ng colours, and ever since in the hands of the blic they have continued to give fairly satisfactory vice.

Our own experiences with hub gears not having en of the most satisfactory kind, we have made it special business in past reliability trials to observe critically the similar fitments on competitors' chines. We have found out that nearly all experi ed riders carefully abstain from using their clutches all. We have several times been informed that this the salvation of the gears, and, although in the ttish Trials just concluded fifteen machines so fitted ned gold medals, it must not be assumed that the ers had every cause to apply unstinted praise to their ange-speed hubs. One of their greatest drawbacks the time involved in withdrawing the wheel when ertaken by back tyre trouble, and this is a serious isance indeed. It should be quite possible to sign frames and gears so that this difficulty is overme. And it is also necessary to strengthen the pping power of the average rear fork end, or trouble e to twisting gears will inevitably come sooner or er.

The alleged drawback due to bouncing owing to the ight in the rear hub is, we think, exaggerated in the se of a touring machine. In racing the objection doubtedly applies. The gear striking rod and toggle int should in almost every case be made stronger, d should be kept as short as possible. These are e drawbacks of this type of gear. The advantages e that with an adjustable pulley very wide gear tios may be obtained, and this gear can be fitted to isting machines fairly easily, and, owing to their neficial effect, many an old $3\frac{1}{2}$ h.p. machine is now oudly drawing a sidecar with comparative ease.

All things considered, we are inclined to the belief at a counter-shaft gear is the more likely type to rvive, and that it will embody not less than three eeds, but in the meantime the hub gear will continue to hold sway. We believe that if the question of quick detachability of the rear wheel fitted with this type of gear were seriously tackled its popularity would receive an enormous fillip. And we also incline to the belief that the clutches fitted to the majority of hub gears are of insufficient surface for the loads they are often called upon to take up.

The Twin-cylinder Tendency.

IT is sufficient proof that our recent remarks concerning the growing popularity of multi-cylinder machines were not far short of the mark to refer readers to the current issue in which we describe two new twin-cylinder motor cycle engines by leading firms in the industry. We could go further at this moment and give names of other firms who are either experimenting or have under consideration the production of a multi-cylinder engined machine for 1914. Personally, we welcome the move as a tendency in the right direction. The old theory that double the number of working parts means a duplication of troubles with engines is now spent, and, though a rider may expect to have to devote a little extra attention to a twin machine, the benefits to be derived are, to most owners' minds, more than compensated for by the much smoother running, the fascination of an engine which "purrs," and the seeming absence of effort so noticeable with a multi-cylinder engine.

In connection with this multi-cylinder tendency, we notice with much satisfaction the originality which is being displayed in design. The copyist is always a year behind the times, and we do commend those designers who have the courage to depart from orthodox lines. The motor cycle engine has not yet reached that happy stage that it cannot be improved upon. In particular the life of bearings must be lengthened, and the question of lubrication opens up channels for improvement. Just as 1912 was a sidecar year, next year bids fair to be a twin-cylinder year. We have always been of the opinion that not enough attention has been devoted by the big manufacturers to multi-cylinder engines, and have held the opinion for a long time that some day or other they would come into their own. At any rate, between now and the date of the Olympia Show, readers may expect to learn of a number of new multi-cylinder machines, including not a few with horizontal engines.

SIDECARING FOR LADIES.

A NOVITIATE'S EXPERIENCES.

SOME little time ago I was consumed with a desire to drive a motor cycle, which, on the arrival of a 5-6 h.p. Clyno and sidecar, developed into a burning passion.

As a perfect novice, without any particular inherent faculty for matters mechanical, my heart ebbed rather low at the possibility of handling this fearsome-looking machine with, to me, such an apparent nest of complications. After one or two rides in the sidecar, when in the open country, I was persuaded to enter on my first drive.

Having been initiated into the mysteries of tickling the carburetter, I succeeded, after one or two attempts, in starting the engine by means of the kick-starter and was agreeably surprised and not a little proud of myself to hear the engine purring gently, and metaphorically champing at the bit, ready for the actual start.

I must confess that it was with great trepidation that I pushed down the low gear pedal—my feelings at the moment might well be compared with those of a person compelled to press the button for electrocuting himself—but, contrary to expectation, nothing happened save that the combination glided away like a young Rolls-Royce, and, after changing into high gear, we soon picked up speed, and I experienced that thrilling feeling of having managed it.

Getting Used to It.

For some miles I was quite content to run with the gas lever about a quarter open and spark lever half advanced, which gave us about twenty-five miles per hour, as the roads were winding, and I did not want to stain my reputation with a spill on the first ride.

Never before had I realised the real pleasure of having a throbbing fount of energy under one's control ready to respond to the smallest touch of a lever, and capable of doing a good forty miles per hour, or slowing down to an ordinary walking pace with such a range of control that makes one feel perfectly safe under all conditions.

Gradually I am acquiring the reason why of various things, and have obtained much useful advice by studying *The Motor Cycle* week by week, which I now look forward to with the pleasure known only to the devotees of a hobby.

It must be confessed that it took me some while to appreciate the necessity of retarding the spark when the machine slowed down up a steep hill, the paradox to me being that you advanced the spark for more power and more speed, and yet at the very time you wanted most power you had to retard. This problem caused me to enquire in my own mind what retarding and advancing are, and why they are necessary? A solution of which made matters quite clear.

Six Horse-power Quite Easy to Handle.

There was a time when I thought a lady could never tackle a heavy sidecar machine of nearly six horse-power, even if she could ride a lightweight, on account of it being so much more difficult to handle, but I am now quite convinced that a sidecar machine is easier for a lady, as she does not have to balance or do the hobby horse trick when starting and rounding greasy corners, and a heavier machine is steadier on bumpy roads. Again, I can arrange my skirt, then start the engine, and the machine glides off like a car,

The writer, Mrs. Montgomery Saxby, owner-driver of a 6 h.p. Clyno sidecar.

without performing a lot of gymnastic feats which, while being perhaps graceful in the male sex, are not exactly ideal from the feminine point of view.

A Suitable Costume.

A word as regards dress—exclusive to lady readers, of course. So far I have found the most satisfactory dress is a tweed costume which I had for push cycling, the skirt of which has a front panel. This panel I split on the left-hand side for about twelve inches, which allows the skirt to hang at each side nearly down to the ankle, well covering the cloth gaiters which I wear for warmth. When I leave the machine I fasten the split by means of buttons and button holes, which converts it into an ordinary skirt. A tight fitting bonnet with ends to tie under the chin completes the outfit.

I should very much like to see more ladies driving, as I feel sure they would enjoy their outings a lot more, and in the case of a sidecar machine they have every opportunity of being initiated into the gentle art.

OCCASIONAL COMMENTS
by "IXION"

Adjustable Belt Fasteners.

I wonder how many sidecar owners have formed the habit of using two adjustable fasteners in each belt? I have been lucky enough to find an absolutely reliable belt fastener in the Forward, of which I have only broken one sample in several years of hard work. These fasteners have three adjustable links, and the change from the longest to the shortest link permits me to vary my gear from 4 to 5 to 1 without touching the belt itself; I simply lower the pulley and change the fastener link. A tourist who is using a 3½ h.p. machine with a sidecar often requires a lower normal gear than 5 to 1, whether he has a three-speed gear or not. If he is content to use one fastener, he must cut the belt or change it for another belt to obtain his lowest ratio; but if he fits two adjustable fasteners in the belt, he can drop from 4 to 6, or even 6½ to 1, by simply lowering his pulley and exchanging the two long fastener links for two short ones. The only demerit in the practice is connected with the carriage of spare belts; a belt with two fasteners in it is even more awkward to furl up and pack away than a belt with one fastener—and that is saying something.

Front Wheel Carriers.

A well-loaded motor bicycle is not a pretty object, nor is it specially comfortable to ride. When a rider starts on a long tour, his rear carrier is loaded up to the height of the Eiffel Tower, and if he is one of the old-fashioned brigade who regard a kick start, with or without the use of the stand, as the mark of a novice, he is apt to vault a trifle low at times in his jump mounts, since he is not accustomed to the huge pack astern. I cannot help thinking that there would be a certain demand for front carriers, designed to hold the toolkit, at any rate; such an innovation would keep the toolbags a great deal cleaner than they are at present. Under the present system we are bound to get our hands into a filthy condition, even if we do no more than get out a spare plug and a spanner from the aft locker, for the bag and its straps are covered with mud or dust after thirty miles. Supposing that a small platform were mounted sturdily above the front wheel, the entire mechanical outfit of tools and spare parts could be packed there in a suitable bag, and would keep fairly clean, while the long distance tourist would have the rear of his machine left free for a flat case on the carrier, and two deep pannier bags, which would hold all his requirements for a longish jaunt. This would incidentally cure the existing troubles which arise so frequently when dust jams the lock of a small rear pannier bag.

The Durability of Cycle Cars.

As cycle cars are at present in the callow stage inseparable from the youth of every species of animal or motor, truth has often compelled me to make harsh and critical remarks about certain features of the industry as a whole, and individual products in particular. I am the more pleased that a recent experience empowers me to pay a very high tribute to a certain cycle car. While I was in the Isle of Man this summer, a unique opportunity came my way. I went out on a cycle car which had covered no less a distance than 15,000 miles; it was one of the very first Morgan runabouts. Its owner challenged me to put it to any test I could devise, and we instantly headed for Sulby Glen. This climb is a reef-scarred, boulder-strewn by-lane, a kind of a backstairs to the summit of Snaefell; the collar work continues for three miles or more, and commences with some very ripe gradient indeed—it is probably all of 1 in 3 on the inside of the two worst hairpins, which are so abrupt and narrow that all cars have to reverse to round them, and that only a very clever motor cyclist can make a clean ascent under Queenberry rules, *i.e.*, without using his inside leg as a pivot to haul his machine round on. We first took the Morgan down the precipice to see how its

SCOTTISH TRIALS. Mrs. Baxter on the way to Applecross. This lady handled her 6 h.p. twin Rex very dexterously.

Occasional Comments.—

brakes were wearing, and it was always well in hand, though occasionally squeaking showed that the lining was worn down far enough for the rivets to scrape on the drums. Then we turned it round and gave the big J.A.P. engine its head on bottom gear. I was more than a little doubtful of success, because this particular Morgan was fitted with racing gears, as all self-respecting machines should be in the T.T. week, and the lowest ratio was no less than 7½ to 1. We bounced up with the engine revving into a scream; in fact, we were going a little too fast for at the second and worst hairpin we made too much vertical progress, and not enough horizontal sweep, with the result that we had to jam the brakes on to avoid collision with the wall. So we let the machine slide back two or three yards, caught it on the clutch, and put it at the awesome bend afresh, restarting with ease from rest on the evil grade. This time we went at the hairpin more cannily, and scraped round with about two inches of steerage room to spare. Even thus it was conceivable we might meet our Waterloo higher up, for on the worst knuckle of the steep gradient, where the heavenward ascent touches its steepest, there is a gulley a foot deep to rest the weary horse; and it was scarcely policy to rush this on a low, light cycle car, so we dropped gently into the gulley with the clutch out, and then smashed the throttle open for the poor engine to re-gather its revs. on its racing gear—and it did so. Evidently the Morgan is a staunch example of a durable cycle car. I have driven others which would not tackle this particular climb in that brief prime which occurs when a motor has been well run in, and yet has not had time to wear.

Reflex Mirrors Becoming Compulsory.

Now that some of the local authorities have made red reflex mirrors compulsory within their jurisdiction, it would appear that the trade should supply these fitments as part of the standard specification for 1914. Those who have to purchase them should tread warily. Finding myself in one of the compulsory areas last week, I went to the principal motor bicycle agent, and asked for a red mirror. He produced one, but my half-crown was scarcely in his till before I began to grumble; he reassured me by pointing out upon it the trade mark of a firm deservedly honoured and trusted throughout the industry, and I strolled back to my hotel, musing. When I came to fit it, my misgivings were more than justified. Its spring clip was even weaker than it looked, and after I opened it enough to get it round the carrier tube, what little temper if ever possessed was obviously lost for ever. Noting its flimsy construction, I was careful only to utilise upon it one of those handy little two-inch King Dick spanners, but the tiny torque of this wee implement was more than enough to loosen the stud in its stem; and when, after nightfall, I rode out of the town, the miserable little contraption tumbled off, and I was stopped by the police. Hastily mustering to my memory a few stray reminiscences of amateur theatricals, I played simple Giles to perfection. As I absent-mindedly lit a weed, I caught a glistening eye beneath the helmet, and Robert was invited to have a smoke—Flor Cabbageo, from the left-hand side of the case, reserved for cabbies and men I wish to injure. He told me there was a shop in the next town, where they sold red mirrors, and I avoided that town by an ingenious detour, and cleared the dangerous area in safety. Now I am enquiring for a really substantial red mirror, mounted in a flanged ring, designed to be riveted to the tail of my back mudguard.

Exhaust Whistles.

My recent criticisms of exhaust whistles were not based on an exhaustive test of every whistle on the market—life is too short for my writing to be based on a comprehensive deduction. So those inventors and makers who have written angrily to me may save their "hot air" as the Yankees call it. I merely described my experience with a few leading makes, because those experiences brought into high relief certain principles which may guide the sanguine amateur in his purchases, and save him good coin of the realm. I have just succeeded in making my last expensive whistle work well. Its main weakness was the fact that carbon deposits, accumulating at a distance of nearly three feet from the engine, well back along a lengthy rear pipe, prevented the valve shutting, since the return spring was ridiculously weak. I made the whistle work by getting a nice Terry spring, in shape and dimensions resembling a Zeppelin airship, and substituting this for the wee coil supplied by the vendors The valve cannot resist this spring but, *per contra*, my poor fingers can scarcely get the valve open against its drag, and I am now looking for a trigger with a greater leverage wherewith to operate the tiresome beastie. In all humility I suggest that so long as motor cycles unfortunately retain pre-historic lubrication systems, with their inevitable consequence of a dirty exhaust, the ideal exhaust whistle should be set as far from the engine as possible, and should be mounted in a by-pass from the main exhaust pipe, so that its working parts do not suffer from a perpetual deposit. Otherwise they should certainly include an easily removable gauze filter, such as was employed on motor cars under the old method of feeding petrol by exhaust pressure.

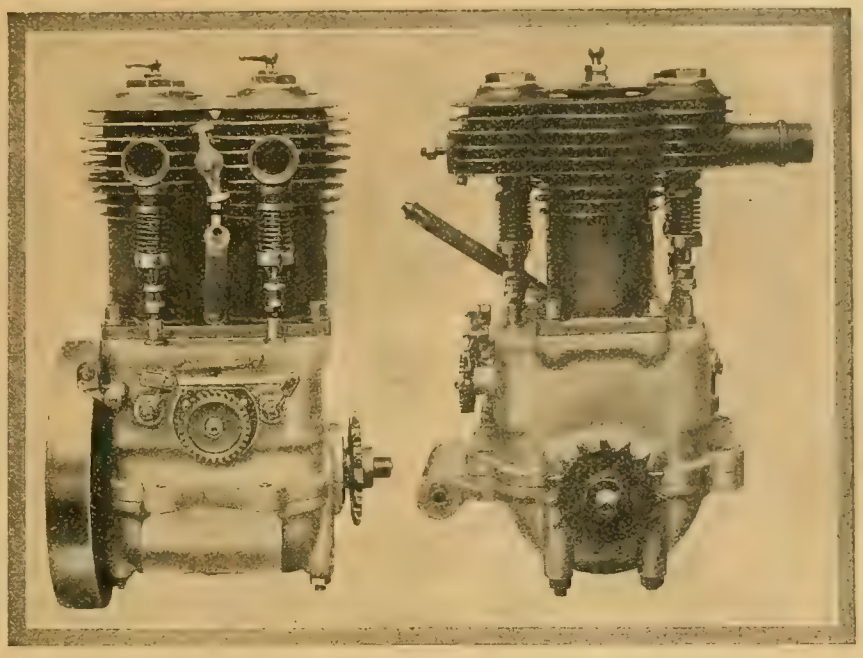
Mrs. A. T. Jenkins, who, with Miss Spink as passenger, drove through the Leeds M.C.C. reliability trial to Edinburgh and back last month. They received a great reception on arriving at the finish. The machine is a 1913 three-speed Triumph with Gloria sidecar.

A TWIN-CYLINDER TRIUMPH.

FEATURES: Side by side vertical engine of 4¼ h.p.; valves fore and aft; outside flywheel. To be adapted to a machine with chain and belt drive and three-speed counter-shaft gear.

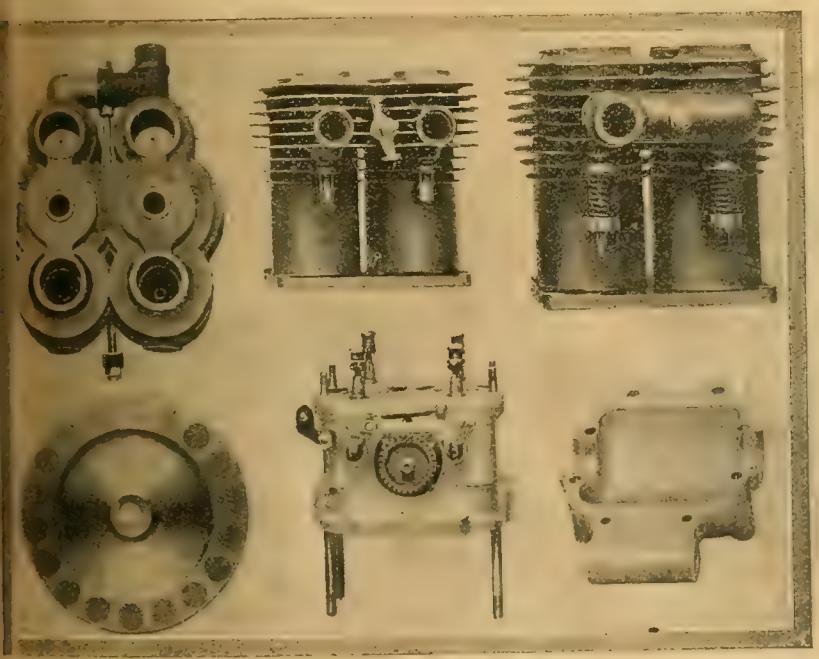
LTHOUGH it has been known for some time past that the Triumph Cycle Co., Ltd., Coventry, were experimenting a twin-cylinder engine of their own n and manufacture, it was not pated that an announcement would ade until towards show time; but week we are able to place before eaders an exclusive description and ations of a wonderfully clever original type of multi-cylinder e which the company in question evolved.

have long been cognisant of the that those responsible for the n of the Triumph have always a strong penchant for the vertical of twin-cylinder engine with double ngs. Experience with cars extend- over long distances has cultured view; consequently one may not be ised that this is the new type of cycle engine, which has now gone a long series of bench tests load, and has emerged with great ise. The next stage of its progress be exhaustive tests on the road. of the main advantages of the al type of twin engine is that e bearings of ample size may be and this is an important point, that even in these days, after years of experience with V type es, the big end bearing is the most rable point. Side by side vertical are not new to motor cycle prac- Old readers of this journal may ect the Werner and the Berkeley, those engines had enclosed fly- s.



Side and end views of the new 4¼ h.p. vertical twin-cylinder Triumph, with outside flywheel and valves fore and aft. The left hand illustration clearly shows the neat valve lifter.

But not only are the Triumph bearings of large dimensions, but they are further adjustable, and can be readily got at by removing the lower half of the crank case, as in many patterns of up-to-date cars. A motor cycle possessing this feature, however, will score over the car, for in case of necessity it would be possible to turn the whole machine upside down, and thus expose the crankshaft and its bearings as clearly as if they were on a bench. The engine is rated at 4¼ h.p., and, of course, mechanically-operated valves are used, situated fore and aft, the exhaust valves, naturally, being in the coolest position in front. The valves are operated by a single shaft placed in line with the frame, and driven by skew gearing from the crankshaft. The shaft itself has four cams (two at each end), the whole being cut from the solid. The central skew on the crankshaft is readily adjustable as to its position, so allowing an alteration of the valve timing, if need be. The magneto, which is driven by another skew gear from the rear end of the camshaft, is independently adjustable. Adjustable tappets are used, with fibre insertions in the top to reduce clatter. Ball bearings are used throughout the engine, with the exception of the small and big ends, which are of the plain bearing type. The crankshaft is formed out of a solid piece, the skew gear in the centre necessitating very accurate machining. The valves, which have heads measuring 1 5/16in. diameter, are of the ordinary type, and standard 3½ h.p. valve springs and cups are used. The cylinder is cast in one piece, and is as excellent a specimen of the foundry-worker's art as the standard 3½ h.p. cylinder, which is saying great deal. The radiating fins have been carefully



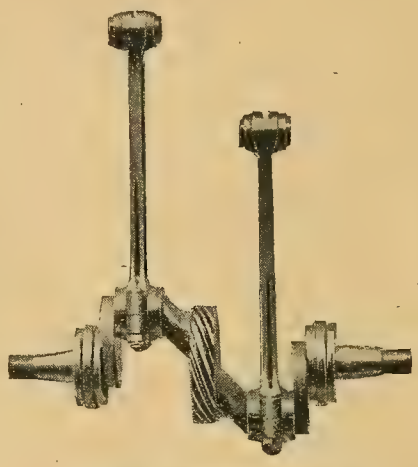
rts of the new Triumph twin. The top row of illustrations shows the single piece casting from ll ent aspects; bottom row, the flywheel with lead inserts, and top and bottom half of base chamber.

A Twin-cylinder Triumph.—

proportioned both as to the valve pockets and around the cylinders, and, of course, every opportunity has been taken to provide air passages between the cylinders to assist cooling.

On the first engine produced (which we examined in detail last week), the pistons rise and fall alternately, so that the firing is not absolutely even. This practice is adopted on many high-class cars, though one would imagine on first consideration that an engine which fired at equal intervals would give the smoothest running. One can, however, rely upon the Triumph engineers satisfying themselves before the new twin is marketed which system is the better. The lubrication of the bearings has received very careful consideration; not only are oil scoops provided at the bottom ends of the connecting rods, but channels are formed in the rod itself to conduct oil to the vital point. The pistons are of the flat-topped pattern, and are provided with a step cut ring top and bottom. The outside flywheel is of stamped steel with lead inserts. The valve lifting mechanism is of exceedingly neat design, the two levers being interconnected and having a beautifully smooth operation. As will be gathered from the illustration showing the square crank case with its horizontal division and the outside flywheel, advantage has been taken of the best car practice. In fact, briefly, the Triumph twin may be termed the embodiment of all that is good in a twin-cylinder car engine but with air-cooled cylinders. It is surely an attractive point to know that by removing the gudgeon pins and undoing the four nuts which hold the lower half of the crank case in position the crankshaft and connecting rods can be removed from the engine, leaving the top half *in situ*, the cylinders having first been removed.

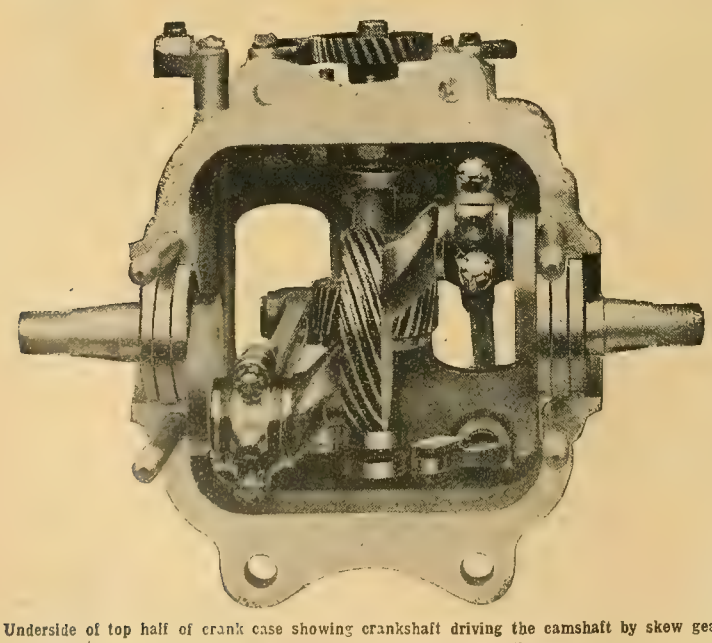
The engine having two cylinders facing the direction of travel necessitates a special design of frame. The engine, however, is so neat and compact that it does not look unduly wide. The new twin will be tested in conjunction with a new Triumph three-speed counter-shaft gear with chain drive from engine to counter-shaft and belt drive by large diameter pulley thereafter.



The twin-cylinder connecting rods and crankshaft.

At present, we are requested not to divulge the engine dimensions.

The advent of the Triumph twin engine will undoubtedly be hailed with delight; many are the letters we have received from readers imploring the Triumph Cycle Co. to produce a twin-cylinder engine of the same exquisite workmanship which is embodied in their world-famous 3½ h.p. single-cylinder machine. Readers may rely upon our keeping them in touch with developments in connection with this interesting and praiseworthy design, the originality of which will appeal to novice and expert alike.



Underside of top half of crank case showing crankshaft driving the camshaft by skew gearing. Observe the adjustable big end bearings and oil scoops.

SCOTTISH TRIAL ECHOES

W. Pratt's aluminium embossed numl plates were greatly admired. He al had his tank enamelled a delicate mau tint, and the general finish of his P. a M. was superb.

The little 2½ Connaught, which w fitted with a G.H. gear box, used ve heavy driving chains. Cocks admitted us that they were quite unnecessar heavy, but he meant to make certain being free from transmission troubl The running of this miniature two-stro engine was one of the surprises of t week.

The number of belts used up w appalling, and really could not have be necessary. One rider of a big variat geared mount fitted a new belt nea every day! He said he was runni them in preparatory to the English Days' Trial. But why so many?

Hub gears came in for a good deal abuse. Apart from frequent adjustme being necessary, hub gears, for import trials run to time schedules, have disadvantage that they take a considera time to refix the wheel after tyre troubl

The P. and M. riders' habits of cle ing up before entering controls was c tagious, nearly everybody following th example. "Not that we want to," one rider said to us, "but we look jolly shabby in comparison if we don'

W. C. Brandauer, who won the spe prize for private owners, is an Austri He described the course as very l that which he is accustomed to arou Vienna. He is a real enthusiast, has owned several Indians. Althou able to speak five languages fluently, could not master Gaelic in the short ti at his disposal.

One excellent feature of the Trials w the way the officials themselves u motor cycles to go round. The secret covered the whole route on his Bat, the official cars were reduced to an ab lute minimum. This is as it should for the dust was bad enough with cars to make it worse. Besides, mo cycles were far better able to get course than cars were, in many of sections.

We rather fancy that a far grea number would have got through ordinarily careful driving had been served. A great many riders were too prone to rely on impetus on th climbs rather than on a low gear rat Impetus rather fails as an assistant 1 in 3 hairpins!

Lionel Martin's impromptu hill-cli ing exhibitions on the Singer cy car during the last few days of Trials were quite a feature. He repai his axle trouble by Wednesday, and Thursday gave a fine exhibition Applecross, climbing the hill w three up. On Saturday he took f up Kenmore. Anyone who knows eit hill will appreciate what this means.

:ottish Trials Echoes.—

Which was the cycle car which shed s propeller-shaft descending a steep ıl through the driver applying his rear rakes so hard that the shaft slipped orward out of the axle? And was it ot a very smart repair that enabled im to check in correctly without losing arks?

The law concerning cut-outs is evi-ently not much observed in Scotland. o attempt to seal them was made, nd nearly everyone made the fullest se of them. But in some of the remoter parts of the journey the crackle was positive company. Our machine was not fitted with a cut-out, and we often wished it was, so strange was the Highland silence at times.

A slight amount of misunderstanding has been caused in some quarters by it having been announced that certain riders had gained gold medals, although published as having lost marks during the week. As a matter of fact, there were cases during the trials where riders who eventually won gold medals were posted at night as having lost marks, but on investigation later by the club these marks were restored to the riders on their entering a protest and sustaining it.

As there is no hotel at Applecross, competitors were treated to an *alfresco* meal by the seashore, but as the weather was tropical it was pleasant to be out of doors. One rather wonders how sufficient food for over one hundred hungry travellers was conveyed to this desolate spot, but there it was all right—another feather in the cap of the managing committee.

SCOTTISH SIX DAYS TRIALS.

(2) G. Featherstonhaugh and D. H. Noble, both riding 3½ h.p. Rovers, on Glendoe.

(3) A. U. R. Downie (2¾ h.p. A.J.S.) on the Bridge of Brown, Tomintoul.

(4) H. F. S. Morgan (8 h.p. Morgan) climbing Man Ratican, Glenelg.

(5) S. Wright (Humberette) in Glenelg.

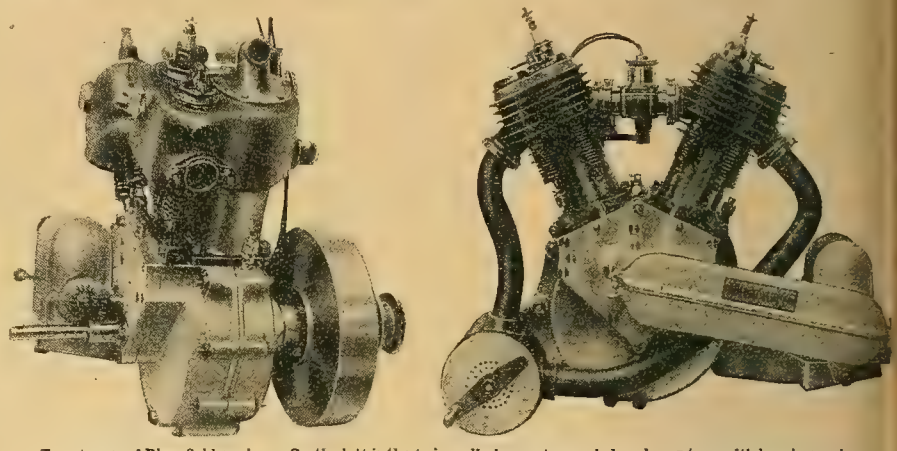
A NEW BLUMFIELD CYCLE CAR ENGINE.

ONE of the latest additions to the series of engines made by Blumfield, Ltd., of Lower Essex Street, Birmingham, is the 8-10 h.p. water-cooled cycle car engine. This is of the V twin type, with cylinders 81½ × 95 mm. bore and stroke = 991 c.c. The water outlets are clearly seen at the top of the cylinders, but they can also be taken from the sides if desired. The magneto platform is cast in one piece with the timing gear cover, and the armature is driven by bevel gearing from the half-time shaft. The crankshaft is extended in the front to take a starting handle, and, in addition to the inside bearing, is further supported in a long gun metal bearing bolted to the timing case. At the clutch end the crank case webs are lengthened and strengthened, and a bush inside the bearing takes the end thrust of the clutch when it is withdrawn.

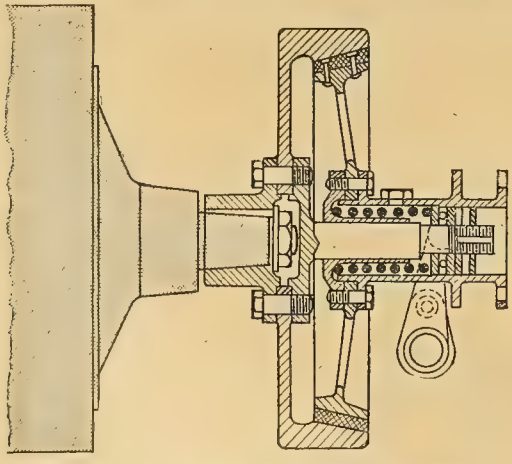
The engine is supplied with or without an exhaust valve lifter, and when furnished minus the lifter the valve tappets are adjustable. The connection for the carburetter is a reversible T piece, which enables the carburetter to be fitted either in front of or behind the cylinders.

The cone clutch is of the internal leather-to-metal type, and is provided with a Hoffmann ball bearing to take the end thrust of the clutch when the latter is withdrawn. Chrome leather is used to cover the clutch cone, and, owing to the nature of this kind of leather, it is said to run satisfactorily without constant dressing. The lever for operating the clutch is of hardened steel, and bears against the back end of the thimble shown, which is also hardened steel. To adjust the clutch spring without dismantling the clutch, a slot is cut in the thimble, through which is passed a cotter to prevent the adjusting nut from turning; the clutch is then turned while the nut is held, thus tightening or loosening the spring according t requirements.

As illustrated, the engine is intended for shaft driv but it is equally suitable for chain transmission, i which case it is fitted with a chain sprocket on a extension of the clutchshaft. One or two recer improvements have been made to the 5-6 h.p. twin ai cooled Blumfield engine, such as a new magnet platform, new silencer and arrangement of exhau pipes; these we illustrate. The magneto chain cov

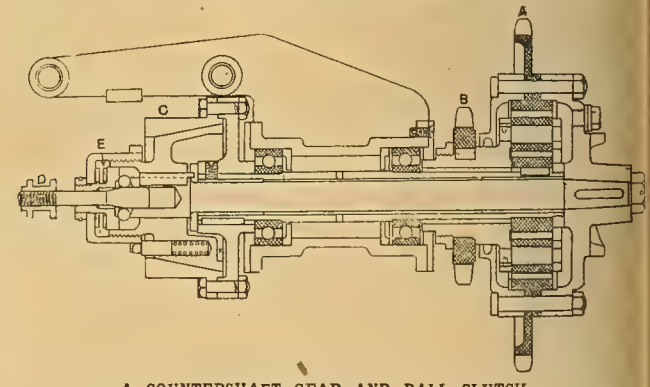


Two types of Blumfield engine. On the left is the twin-cylinder, water-cooled cycle car type with bevel gea drive to the magneto and cone clutch. Right, the twin-cylinder air-cooled motor cycle engine with chain-driven magneto.



The design of internal leather to metal clutch fitted to the new water-cooled Blumfield cycle car engine.

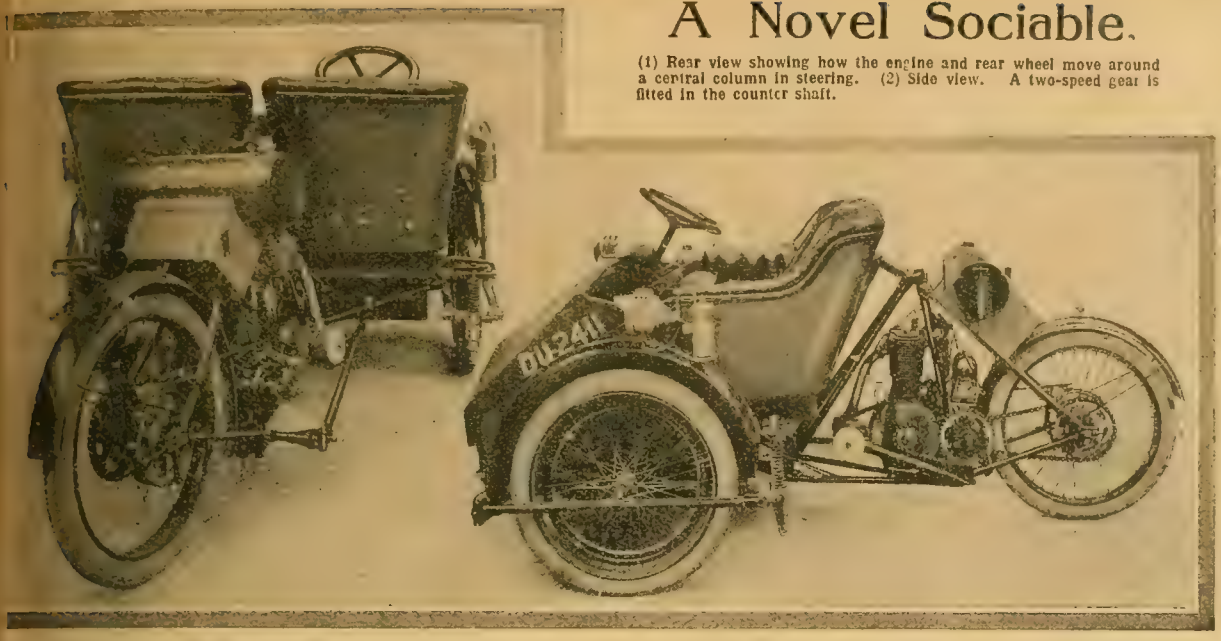
is divided horizontally in the centre, hinged at the re end, and fastened at the front by a hinged bolt an knurled nut. The top half can be instantaneous lifted up and hinged back. A cone formed on th timing cover and a corresponding cone in the ca where it fits over the driving sprocket renders the ca secure and prevents it from working sideways. Messr Blumfield, Ltd., are also at work on a four-cylind cycle car engine, the dimensions of which are 62 × 9 mm. = 1,088 c.c., which is expected to give abou 20 h.p. on test. From our inspection of the part this promises to be a fine piece of work indeed. W shall refer to the engine again very shortly. Incide tally, we may mention it is the usual practice of Messr Blumfield, Ltd., to file a record of the b.h.p. tests o every engine sent out, and none is allowed to pas without developing about double the nominal horse power at which the particular engine is listed.



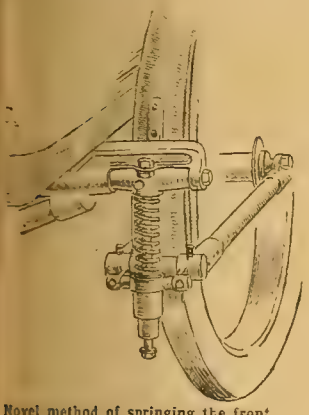
A COUNTERSHAFT GEAR AND BALL CLUTCH.
The above is a section of the gear fitted to the novel sociable described on page 1021.

A Novel Sociable.

(1) Rear view showing how the engine and rear wheel move around a central column in steering. (2) Side view. A two-speed gear is fitted in the counter shaft.

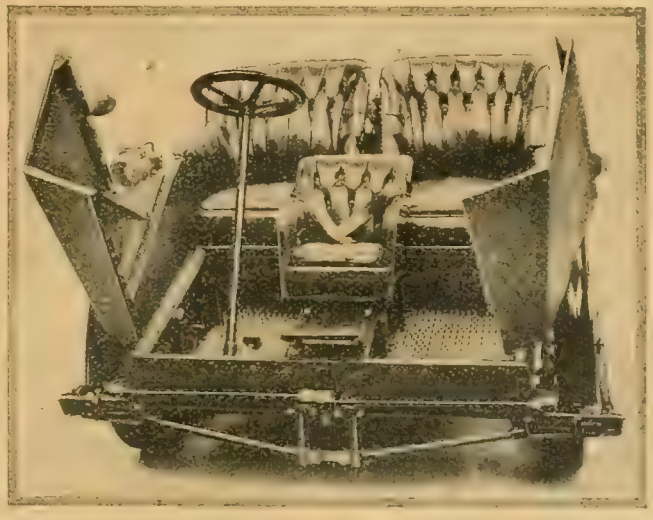


A FEW days ago we came across a very unusual type of sociable built by Mr. J. Dixon, of 43, Northumberland Road, Coventry, to his own ...ias. Probably the feature which first strikes the ...erver is that, though the machine is driven by a ...gle rear wheel, it is steered also entirely by the same wheel. Certain obvious advantages are inseparable with this system. For one thing, a very wide lock can be obtained, and, the front wheels being fixed, the full width between them can be used for bodywork. To obtain these advantages a good deal of ingenuity was required, but the difficulties have ...n successfully overcome and some other interesting ...tures included. The engine, a 4½ h.p. Condor, ...ves a two-speed epicyclic gear by means of a chain, ...d another chain conveys the power to the rear ...eel. The whole power unit is mounted on a frame ...ich also carries the rear wheel, and is pivoted on ...tay which slopes backwards and downwards. This ...r frame is connected by means of a tie rod to the ...ering gear, which consists of a pair of bevels oper...d by the usual hand wheel and giving a reduction ...3 to 1. The effect of the pivot being set on the ...pe is to cant slightly the top of the wheel inwards ...corners, a good point which we have never seen ...orporated in any previous design.



Novel method of springing the front wheels.

The gear is chiefly interesting in that it includes a ...tch operation patented by Mr. Dixon, and which is ...arly visible in the drawing on page 1020. It will be seen that a taper pin when drawn outwards forces a series of steel balls outwards, and by means of inclined planes wedges the clutch members apart. Our photograph gives a good idea of the rear springing device. Both front wheels are carried in tubular frames pivoted to the front frame member and suspended on coil springs at the rear end, giving the machine a very easy motion on the road. V rim brakes are fitted to each front wheel and operated by a hand lever between the seats, which also engages the high gear. Two pedals control the low gear and the rear band brake and exhaust lift respectively. The seats are placed side by side with a child's seat between, and are protected by a screen which opens outwards from the centre. The petrol and oil tank is carried over the rear wheel. The machine is well built and cleverly designed, and we spent quite an interesting hour examining its novel features.



Access to the seats is obtained from the front. A neat child's seat is fitted in the middle.

A NEW TWIN JAMES.

FEATURES:—500 c.c. Three-speed Gear Box and Chain Drive Throughout.

It is fairly well known that the single-cylinder James motor cycle is chiefly used for passenger work, and the makers, the James Cycle Co., Ltd., Greet, near Birmingham, have found that in consequence a solo rider barely considers this model when on the look out for a new mount. They have, therefore, introduced a lighter machine with a newly designed twin-cylinder engine which possesses several interesting features. Three of these new models will be entered for the A.C.U. Six Days' Trials, ridden by T. Pollock, P. O. S. Brown, and H. Graham Dixon, and these three riders will compete for the team prize. Two sidecars, driven by A. D. Arter and T. Stevens, will also take part.

The Engine and Gear Box.

The new machine, which we inspected a few days ago, has a twin V engine with cylinders at 55°, and a bore and stroke of 64 × 77 mm. = 496 c.c. A three-speed gear box, with multiple plate clutch, is fitted on the counter-shaft, and the transmission is by chain throughout, the chains being enclosed in metal cases. The gear box, clutch, kick starter, etc., although closely following the lines of those on the large single, are reduced in dimensions, and therefore are lighter; they are, however, lightened only in proportion to the reduced power of the engine, and only the highest grade steel procurable is used in the production of these parts. In the big single, the gear box is vertically placed, but the new twin has the gear box horizontal. The change speed quadrant is attached to the bottom tube, and a gate change is provided with a small lever like a car. The gear ratios are 5, 8½, and 13¼ to 1. The frame has a dropped top tube, triangulated front members, and flat section steel cantle supports the engine, gear box, footrests, and foot brake attachments, the magneto being mounted on a lug above the gear box. The distance from top of saddle to ground is 29in.

A Symmetrical Design.

A feature of the design is that the front cylinder and down tube are parallel, also the rear cylinder and seat tube, so that a symmetrical appearance is obtained.

The mudguards are four inches wide, and have side extensions front and rear. The wheels and tyres are 26 × 2¼, and spring footboards are fitted. The silencer is placed in front of the engine, and a long exhaust pipe extends from it on the left side of the machine to a point near the rear wheel centre. Other usual James features are incorporated, such as celluloid covered handle-bars, etc.

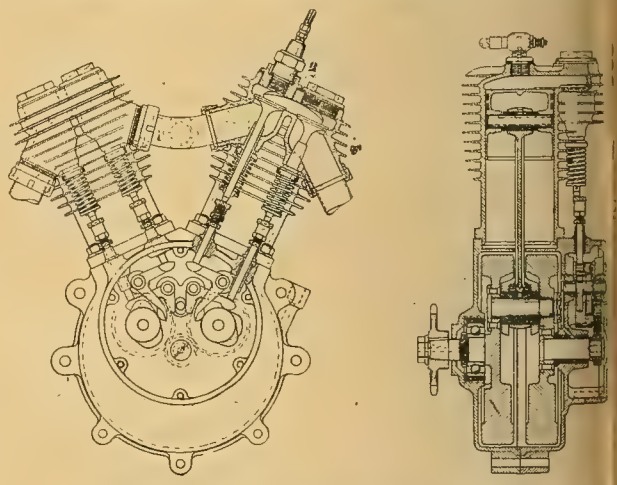
The V twin engine is neatly designed, and, as will be seen on reference to the sectional drawing, the inlet valve ports are cast at the same angle as the exhaust ports, which gives a wide and easy passage for the flow of the gases. The inlet pipe is curved downwards to allow it to accommodate itself to the somewhat unusual angle of the inlet passages. In the cylinder casting air passages are arranged between exhaust and inlet ports, as well as between the valve chamber and the cylinder, the aim being to secure uniformity in the casting and equal expansion of metal. The radiators are staggered around cylinder—now a recognised James feature.

An Easily Cleaned Timing Case.

The timing gear for each cylinder is arranged w one cam wheel, on which are two cam conto engaging rocking arms for inlet and exhaust valv The exhaust lifter mechanism is also enclosed in same case, and no lever protrudes, the cable and w being led direct to an opening on top of the ca The timing cover and rear portion of magneto ch case are one casting, and oil flows into the chain ca so keeping it well lubricated. The valve tappets adjustable, and the external portion of the tim case is quite smooth. The steel flywheels are sc with the shafts. The pistons have two rings ab the gudgeon pin and the pin is slightly tapered, secured by a third ring. Lubrication is by spl and the usual hand pump.

Novel Magneto Timing Device.

An interesting item is the adjustment provided the magneto timing. The chain wheel on the c shaft is slotted radially at two points, and attached a boss on the shaft end by nuts which screw on



The new 500 c.c. twin James engine in part section.

pins projecting from the boss and passing thro the slots. This arrangement allows the chain wheel be tightened relative to its shaft at any point wit the range provided by the slots, which is 90°. chain wheel on the magneto armature spindle is fi on a cone, but need not be disturbed for re-tim the spark.

Incidentally, we learnt that the introduction of t new model will not interfere with the rapid product of the passenger machine, as the James Co. are stalling new electrically-driven plant of about 150 h and extending the shops in the rear of their pres premises, where there is ample space for a build of 18,000 square feet area. The big single-cylin model already referred to has proved so satisfact this year that very little alteration will be made in design for 1914.

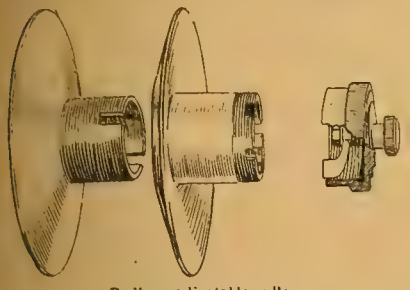
AMONG THE ACCESSORIES.

The Rodham Pulley.

A simple toolless adjustable pulley is in article which will always find a ready market, and such a device has just come to our notice. Our illustration is

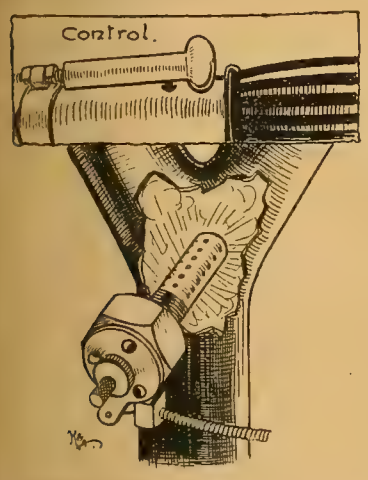


Rodham adjustable pulley.

self-explanatory, and it is only necessary to state that a steel jaw drops into two long slots and forms a sensibly strong locking device to prevent the two flanges rotating on each other. The pulley is well and solidly made, and may be obtained from W. H. Rodham and Co., Long Street, Stratford Road, Birmingham.

Speedler Air Inlet.

A novelty recently introduced by Messrs. Markt and Co., Ltd., of 98-100, Clerkenwell Road, E.C., is the Speedler, a small air inlet which is particularly well designed, and intended to be fitted in the case of a twin-cylinder, at any rate, in the induction pipe branch. It consists of a pipe with a hexagon at the top end. This pipe has six rows of seven holes each. The top of the nut is drilled and provided with a flat valve. The idea is that the air is injected through the small holes into the centre of the mixture, thereby assisting vaporisation,

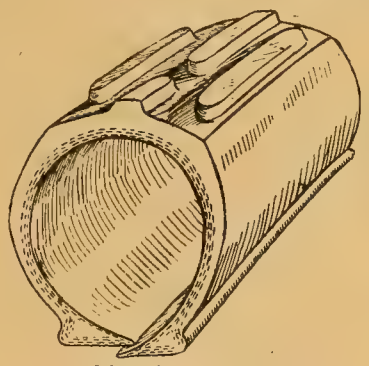


Messrs. Markt and Co's "Speedler" extra air inlet.

enabling one to obtain a more perfect mixture, and also acting as a cooling device, as when a hill is descended the driver can close the throttle, open the air valve and take cold air into the engine, at the same time using the engine as a brake. The spindle on which the valve turns is hollow, and is provided with a cap, and with the outfit is supplied a rubber tube. When it is thought necessary to decarbonise the engine this tube is fitted on to the end of the spindle, after the cap has been removed, the other end of the tube being allowed to dip into a cup of paraffin. The engine is then started up and paraffin is drawn up into the engine. This, the makers claim, will decarbonise the engine. The device should especially appeal to users of automatic carburetters who are not quite sure of obtaining sufficient air at high speeds. This is certainly a useful device which should find a ready sale. An improvement, however, might be made in the design of the control

A New John Bull Tyre.

We illustrate herewith the latest production of the Leicester Rubber Co., of the Granby Rubber Works, Leicester, which will be known as the "John Bull Rib-Stud Tyre," from the long rib-like studs of extra depth which compose the non-slipping tread. This tyre is



John Bull Rib-Stud Tyre.

made in one size, $26 \times 2\frac{3}{8}$ inches, to fit $2\frac{1}{4}$ inch rims, and is of the same highly compressed quality as the John Bull Cross Groove. The tyre is very substantial, but at the same time very flexible. We are about to make a test of one of these tyres and anticipate very satisfactory results, judging from its appearance and the "feel" of the rubber of which it is composed. The John Bull tyres used by George Brough were in perfect condition at the end of the Scottish Trials.

The Excelsior Plug.

This is a new form of plug which has been introduced by Mr. J. Henderson Meyer, 12, Lime Street, E.C. As will be seen from the accompanying illustration, the centre is hollow and in it is a ball valve. This ball allows a certain amount of air to be drawn into the cylinder, thereby keeping the plug clean and improving the mixture. Moreover, the top of the spindle is covered with gauze so that while dust cannot be drawn through, petrol can be injected at this point. In the case of the air drawn through the plug, causing the mixture to be too weak, the carburetter air inlet may be closed slightly.

The Baby Hood.

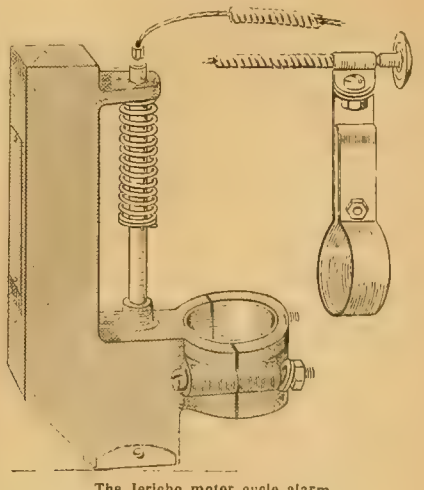
A novel accessory for the additional comfort of the sidecar passenger is the baby hood, which consists, as the name implies, of a small hood, and is fitted with a celluloid screen. The little hood

A storm-proof hood.

is made to fit over the passenger's head, and in cases where a storm apron is used it forms a complete protection.—H. R. Starke-Jones, Park House, Halifax.

The Jericho Horn

The device which we illustrate shows a new warning device known as the Jericho motor cycle horn, and sold by Messrs. G. H. Smith and Co. (London), Ltd., 12, Mortimer St., Great Portland Street, W. It is a very well made article, finished in aluminium, the admission of the exhaust gas to the whistle being governed by a valve.



The Jericho motor cycle alarm

LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Caps for Motor Cyclists.

Sir,—Why is it that suitable headgear has not yet been evolved for the motor cyclist? The ugly makeshift of turning one's cap the reverse way is handy for accommodating one's goggles, and offers less wind resistance, but it seems to me that the old type of close-fitting cap, similar to the cricket cap, only slightly fuller, is not only more suitable but even looks much better than the hideous, bulging modern affair. I fear we are hidebound by convention, even in the motor cycling world. M.R.C.S.

Cycle Cars v. Sidecars.

Sir,—*Re* the letter appearing in *The Motor Cycle* of July 24th from Messrs. Morgan Motor Co., Ltd., although not the original contributor of the letter they speak of, I, too, am firmly of the belief that had Barnes's Zenith been more fairly treated there would have been a different tale to tell. In other words, I do not believe the cycle car is as good as a first-class sidecar outfit in its present form, although I think it will come into its own later on. At present I plump for a sidecar combination all the time.

J. ROWLAND-ROUSE.

Are Three-wheelers Cycle Cars?

Sir,—Mr. Armstrong misunderstands me, and I must apologise to him for not having made my meaning more clear. I admit that in the C.C.C. hill-climb three-wheelers were allowed to compete among themselves. I grant that, as all times were published, they had the opportunity (of which they fully availed themselves, being first, second, fourth, and fifth) of showing their superiority on time. They had also the opportunity, as Mr. Armstrong reminds me, of winning the special award on Dr. Low's formula, provided that they could have attained about twice the speed of the fastest four-wheeler, a superiority which I am too modest to claim for the Morgan. The question of awards does not interest me, but, as a matter of principle, I wish to uphold the broad definition of the A.C.U. in the spirit as well as in the letter. H. F. S. MORGAN.

Fair Treatment.

Sir,—As a regular reader of your paper I have noticed many letters acknowledging generous treatment at the hands of motor cycle manufacturers. I should like to let you know my experience with the Enfield Cycle Co., Ltd. I purchased a 1912 second-hand sidecar machine this year, and, unfortunately, broke the spindle of my two-speed gear and cone of the front wheel on separate occasions, and on sending same to them had parts returned to me repaired free of charge within the week.

I think this was more than fair treatment, as I had no claim at all. I am quite satisfied with the combination, and add the usual disclaimer. C. H. KING.

Sir,—I am writing to give you particulars of a case which I think is worthy of publication under the above heading. About eighteen months ago I purchased a Cowey speedometer, which a short time ago got damaged in a fall due to a burst tyre. I sent the instrument to the makers and advised them of the circumstances, when to my great surprise I received it back (carriage paid) in a few days, with a new driving flex and wheel, etc., the invoice being marked "No charge." I might add that I have no interest whatever in the firm beyond being a satisfied user.

A. E. SHOWELL.

Nailsworth Ladder.

Sir,—Your mention in the issue of July 24th of the ascent by an Excelsior of the above-named villainous climb on Monday, July 21st, suggests to the writer that your readers may be interested to learn that 5-6 A.J.S. with sidecar and passenger made the ascent on the previous day (Sunday). I was one of the party of seven (as a passenger), and the machine in question was driven directly off the village High Street and swarmed to the top of the ladder without a stop. The driver of the successful machine had not previously seen this "freak" hill, and he was closely attended by two solo riders of the party, also on A.J.S. machines, all of which rushed the hill in fine style. The gradient, we understand, is 1 in 2¼, and we believe this is the first standard machine with sidecar and passenger to have conquered the "ladder." According to the natives, many have called, but have not left their card—at the top of the ladder. J.W.

Wear of Bearings.

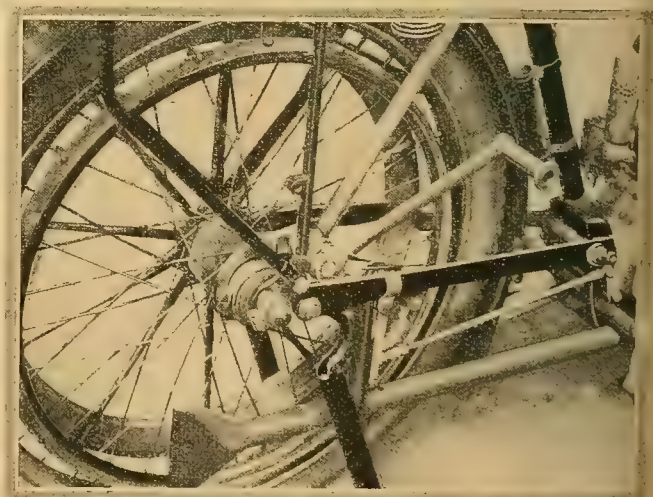
Sir,—Taking the article written by "A.M.I.C.E." to apply particularly to bearings as used in motor car and motor cycle engines, I questioned his seriousness in quoting lead as a suitable metal under *any* conditions of lubrication.

The letter in your issue of July 24th, in which he qualifies that statement, brings us into line.

What I would point out is that a hard metal may be most satisfactorily used, if cast so as to render it perfectly homogeneous, and without fear of undue wear on either the pin or the bush.

It is to a large extent the hard and soft places, caused by segregation in the casting process of an ordinary bush, which causes this trouble, together in many cases with inefficient lubrication.

The remarks as to roller and ball bearings are certainly justified, and they can be no help in the solution of the trouble. A.M.I.M.E.



A TRIUMPH KICK-STARTER.

We noticed the above new kick-starting apparatus on a works Triumph last week. Observe the absence of chains or small parts likely to need adjustment or attention.

In answering these advertisements it is desirable to mention "The Motor Cycle."

The Motor Cycle for Business Purposes.

Sir,—For many years I have been amused and amazed by the ridiculous statements made by novices both in letters in the motoring press and to their friends and acquaintances as to the cost of running both motor bicycles and motor cars. I mention the latter because, except for the same tendency to put the cost per mile of running these also far too low, the public might overlook the advantage of the motor bicycle from the point of view of cost.

I have now been running different motor bicycles and sidecars for many years (my present one, an 8 h.p. Zenith, in a few months only 5,000 miles; the one before, a Triumph with Zenith gear, in two years 25,000 miles; the previous one, a Triumph with Mabon clutch, 24,000 miles in two years), and I have taken the trouble to keep an accurate detailed cost per mile of running, but (and it is a very big but) I have included everything. On each machine I sold well, and avoided heavy depreciation (I got £45 for the Triumph-Gradua and sidecar after 25,000 miles over two years).

Now "Traveller" would have us believe that a Clyno and sidecar, which is one of the heaviest motor cycle combinations, can be run 196 miles for 5s. or just over .5d. per mile. The fact is that even with the much lighter and less expensive combinations referred to above, the actual cost is from 1½d. to 1¾d. per mile, using exactly the same extra Palmer cord tyres to which he refers, and that includes doing all my own running repairs and never employing a local garage, because if I cannot do the job myself it means the local man also has to go to the makers.

The figures of "Another Traveller" for a powerful twin are certainly not over-estimated. It cannot be run at less than 2d. a mile. Taking "T.H.B.A.'s" figures, his estimate is on the low side in many respects. Take his first item. He values his outfit at £100, and allows £15 depreciation in one year over 15,000 miles. I should like to know how many answers he would get if he advertised the outfit in your columns at £85 (no lower offers). I have an 8 h.p. 1913 Zenith with all the latest improvements, with the most expensive sidecar and accessories on the market and coach-built body, and it has only run 5,000 miles, and it cost well over £100. I will now take the first offer of £85, and be glad to get it. Then petrol; he might get fifty on a gallon with careful driving on a fixed run, but over a year this will be reduced to at least 40% or 20% more.

Tyres. In actual practice the driving tyre will run on the best average 2,000 miles, and if a good make will retread and go a similar distance, the front wheel 4,000 and the same after retread. The sidecar tyre, if castor wheel, should run the 15,000 without retread; if not castor wheel the same as front wheel tyre. The inner tubes with one spare would, if a good make, run the whole distance, or twice as far, so that "T.H.B.A." will have to bring his tyre cost over 15,000 miles up to £12 at least. He says belts (with luck) four. I should think so, too. Four belts in 15,000 miles, winter and summer, or 3,750 miles per belt. If "T.H.B.A." doubles this he might do it (also, with luck), but he must buy the right belts. Repairs, replacements, and spares, £5. This also wants doubling in 15,000 miles. The best 5-6 h.p. machine in the world run with a sidecar will want at least two complete overhauls at the maker's works, which will cost more than the amount stated, without home or local repairs; and, to be on the safe side, "T.H.B.A." should make his penny a mile twopence a mile at least to cover cleaning, lighting, special clothing and a hundred other small items which mount up.

I met a man only recently who tried to persuade me, as he had persuaded himself, that his motor car costing £480 cost him 2d. a mile to run all in. I pointed out that, taking the low figure of 20% depreciation, the cost of running for this item only over 12,000 miles was practically 2d. a mile. The fact still remains that a motor car to do the distance and work of a motor cycle and sidecar will cost from 6d. to 9d a mile, or if you employ a chauffeur it easily goes up to 1s. a mile, while a powerful motor cycle and sidecar can with care be run at 2d. a mile, and is then much the cheapest form of taking two people about the country, and is even cheaper for one, taking into consideration the amount of time saved over railway travelling from door to door, except over long fixed distances on main lines when the business is transacted near the station and there is no business to be picked up on the way or back. E. S. NEW.

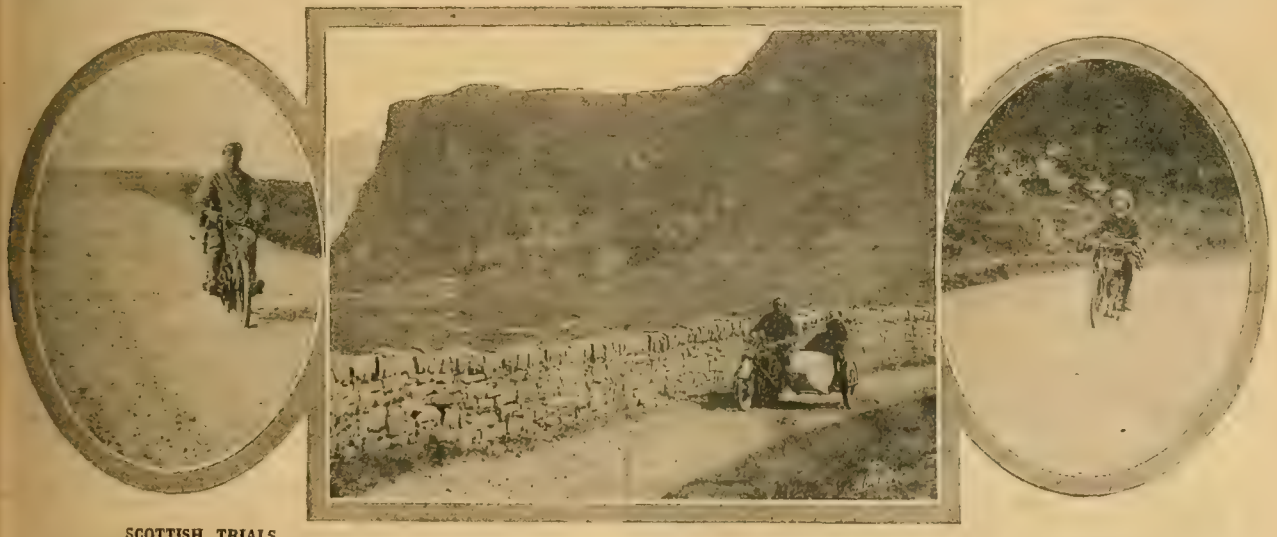
Bon Camaraderie!

Sir,—On June 22nd, near High Wycombe, I pulled up to assist a fellow motor cyclist riding a Matchless and sidecar going to Slough, about twelve miles off. One of his plugs was *hors de combat*. As he had no spare, of course I lent him mine. He took my address, promising to forward the plug in the morning. It seemed to me hardly necessary to ask for his card. However, I have never heard from him since. My only conclusion is I must have met with a wrong 'un. C. WARR.

Benzole.

Sir,—I am very much interested in the various letters dealing with benzole. I can get 90 m.p.g. out of my 1913 Triumph and sidecar with no alteration of carburetter and geared 5⅞ to 11¾ to 1.

In reference to "Hull's" letter of the 3rd ult., I have noticed that I use about the same or less air than with petrol. It struck me the other day that this might be that when using benzole the level is lower in the jet, and, therefore, with the same position of the gas lever you are really using less gas, as it would take more suction to draw it out of the jet, and, therefore, with the air lever in the same position as with petrol you are really using more. I would not go back to petrol for any money. H. L. GRAHAM.



SCOTTISH TRIALS.

(1) A Singer rider on the way to Strathpeffer. (2) D. S. Alexander (8 h.p. Williamson sidecar) on the first portion of Applecross. (3) F. C. North, one of the winning Ariel team in Glendoe.

Sir,—I also have been interested in reading the various opinions given in your valuable journal *re* benzole. I was also prejudiced against the use of it, but, like your correspondent "Hull," I am at last a convert. I happen to know the Doncaster correspondent, and he personally told me that benzole required more air than petrol. I did not find much difference, but of course my experience up to the present has been very limited. However, I will give you my experience. On Thursday, July 3rd, we had a reliability trial to Nottingham and back, and I determined to fill my tank with benzole and give it a trial on the above run, and I may say at once that I was agreeably impressed by its very flexible, sweet-running properties on the outward journey (seventy odd miles), which I accomplished on about half a gallon. I had noticed that some of your correspondents could not make their engines knock, and I tried all I knew to make mine knock, but without success, fortunately, not that my engine is given to this failing. But under exceptional circumstances it was possible; however, not on this occasion. On the return journey, not being able to obtain benzole, I filled up with half a gallon of Shell (not that there was any need to do this, as I had over half a gallon of benzole left). This gave a mixture of half and half, and I found the difference in running most marked, not nearly so good, and a friend riding a 3½ h.p. Rover, who also used benzole for the first time and mixed it with petrol, had the same experience as myself exactly. Now, with regard to the more air theory, I think I am in a position to give an opinion, inasmuch as I used one of my new twelve-jet carburetters, which you so kindly illustrated and described a short time ago. You will perhaps remember that the jets are opened one by one from the handle-bar control, and I found that, as with petrol, to run dead slowly, about seven to eight miles an hour, I had one or two jets open and very little air, and by opening out the air I could accelerate up to twenty miles an hour or so as required. Again, a friend riding a 6 h.p. twin Matchless (myself the 5 h.p. overhead) casually said to me as we were starting from a secret check, "Have a little flutter." I gave the nod, and off we went. I opened out all the twelve jets and full air, and my machine simply bounded away, leaving my opponent as if he was almost standing still, and he told me afterwards that he was doing over sixty himself. Poor chap! the result was a broken inlet valve, and as no spare was in evidence I had very reluctantly to leave him. As to the practically no carbon theory, I am not as yet quite convinced, but hope to find it less than on petrol. J. H. WILKINSON.

Dr. Low's Formula.

Sir,—I notice in last week's issue a letter referring to my formula, but Mr. Morgan writes so nicely that I scarcely like to worry you with another letter. I fear that if I replied at any length I might be accused of being interested in the Cycar, but this is by no means the case. In a hill-climb one's object in formula is to give an idea of the actual efficiency of each machine in lifting itself up the hill. Now I cannot help saying that if the particular machine referred to by Mr. Morgan had the efficiency for *this particular job* of the Cycar it would probably have climbed the hill pretty well as fast as he states. If one works out the propelling efficiencies on a few rough assumptions which there is no need to go into, it will be found that this is the case, and that, therefore, the formula represents effectiveness with reasonable accuracy. If Mr. Morgan thinks that it is better to include more points, such as general wear, then I must agree with him, and in this case one would naturally reduce the value of K; but in a *hill-climb* this is not fair, as one has to distinguish in the particular work the machine is asked to do. Let it by no means be thought that I am saying that one machine is better than the other of the two he mentioned; far from it, and, as an example, let me say that I myself have a car whose engine gives just under 135 h.p. on the brake, and that the pleasure of driving this car is out of all proportion to its undoubtedly very small over-all effectiveness.

A. W. LOW, A.C.G.I., D.Sc., ETC.

Factory Repairs and Agency Tinkerings.

Sir,—The remarks of "Ixion" in your issue of July 24th on this subject are rather too sweeping, though possibly not too severe when applied to some particular agents. All sheep in a flock are not black, and there are on the other side some agents who can do repairs as well as any manufacturer (except perhaps in so far as concerns the manufacture or supply of some new part).

We ourselves claim to do repairs quite efficiently, to any of the known makes of machines. We have taken pains to collect mechanics of the first order, both as regards skill and thoroughness, and in several cases our mechanics have been men selected for us from among their own workmen by the manufacturers whose agencies we represent. For instance, we have in our shops a qualified and recommended man from the Scott Engineering Co., and we have another one similarly selected and sent to us by the Matchless people. Again, we claim to have a Douglas mechanic in whose hands Messrs. Douglas Bros. would not be ashamed to put one of their machines for tuning-up.

In addition to picking the *personnel* of our workshops, we claim to use a correct system of getting work through, and of charging it on a just and equitable basis. We cannot guarantee to turn old machines into new ones, neither can a manufacturer, but we will undertake to guarantee that each job is done well, and, what is more, far quicker than is possible from the big works.

In justice to the white sheep of the agency flock we trust you will print this letter as a protest against "Ixion's" sweeping generalisation.

Second International Reliability Trial

ENGLAND v HOLLAND

THE second international English-Dutch reliability trial was held on August Bank Holiday, exactly a year since the date of the first trial held in Holland. It may be recalled that the inauguration of this popular international event was due primarily to the visit of a party of Dutch riders to the Isle of Man two years ago, and later to Messrs. A. Citroen and Ferwerda, of the Dutch Motor Cycle Club, offering a silver cup for international competition.

At the request of the Dutch M.C.C. last year *The Motor Cycle* received the British entries for the event, and there were so many that subsequently committees of clubs throughout the United Kingdom were appealed to to assist in selecting the eighteen riders (nine each amateur and trade) who should do duty for England. The visit to Holland proved most enjoyable, and one and all came away impressed for a lifetime with the hospitality and sportsmanship of the Dutchmen. The trial resulted in a surprise victory for Holland, owing mainly to an untimely trouble with an English rider's magneto.

Though, according to the rules, the second trial should have been held in the country which won on the first occasion, it was clear that the Dutchmen were bent upon a visit to England, and, therefore it was arranged that the 1913 event should be held in this country, and in case of a British victory, the final event for the silver trophy would be contested in the Netherlands next year.

The organisation of the 1913 trial devolved chiefly upon Mr. W. Cooper (Mr. Loughborough being too busily engaged in the work of organisation in connection with the A.C.U. Six Days' Trials). It must be said that Mr. Cooper has worked most enthusiastically, and the fact that his arduous duties resulted in such a successful event as last Monday's proved to be must be some recompense to him.

The British riders were most anxious to give their Dutch guests a right royal welcome in part return for the kindness and attention received last year, and accordingly a subscription list was opened to entertain the Dutchmen, and there was an excellent response.

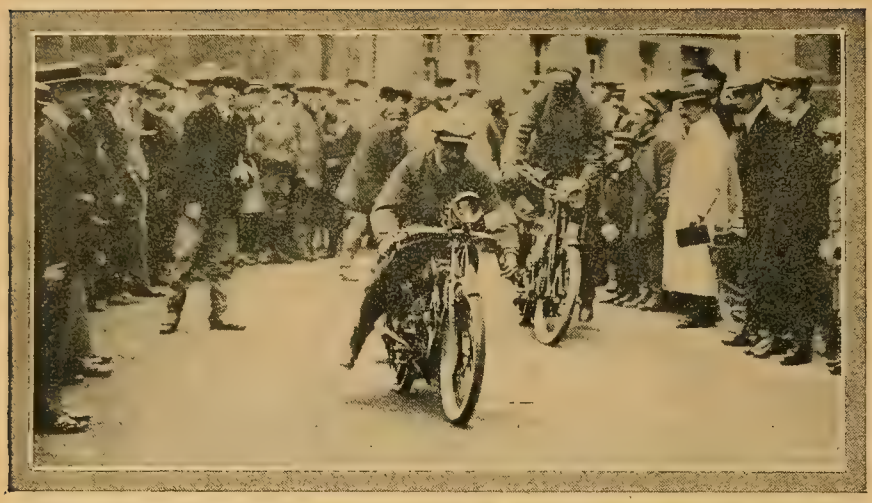
The proceedings opened on Saturday last, when, in the early hours, our visitors arrived at Harwich from the Hook, and, after breakfast, were escorted by members of the British teams and of the Ipswich and District M.C.C. to Brooklands. The journey proved a long and trying one, the Dutchmen not appreciating the twists in the road, besides which they especially complained of the dust and the tar, which made their eyes smart.

The B.A.R.C. had kindly invited the international teams to Brooklands, and it was not long before they were careering round the track. One or two expressed their astonishment at the immensity of the track. Many of the wary ones did not seem anxious to try their paces, preferring, apparently, to keep the tune in their engines. Therefore the action of the Rev. E. P. Greenhill, on his G.W.K., and Messrs. Bower and Barnes, on Zenith sidecars, in taking the Dutchmen round the track in turns was greatly appreciated.

Banquet at the R.A.C.

The next move was to the Imperial Hotel by train, and afterwards to the Royal Automobile Club for the official banquet, at which Mr. J. R. Nisbet presided. The speech-making was necessarily limited by reason of the late hour of arrival of the Dutch riders. After the usual loyal toasts the Chairman proposed "The motor cyclists of Holland," to which Mr. R. Toe Laer responded. The captains of the British teams, W. Pratt and F. Dover, followed with "The Dutch teams," their remarks causing considerable laughter. Mr. Citroen translated Mr. Dover's remarks for the benefit of those of his countrymen who did not understand English. Messrs. Citroen and Ferwerda (captains of the Dutch teams) proposed the English teams, Mr. Citroen's enthusiasm for the motor cycle being plainly evident when he pointed out that their suggestion of the international trial was mainly to develop the ideal machine. He wanted the event to become a per-

Some of the Dutch Team at Brooklands, which they inspected last Saturday, by invitation of the B.A.R.C.



THE FIRST MEN OFF. W. Cooper (2¾ h.p. Humber) and A. L. Versluijs (2¾ h.p. Eijsink) starting.

petual one, and if England did some day win the trophy, then another must be found. He mentioned that he had brought the trophy merely to "show" the Englishmen—a remark which caused some amusement.

In subsequent remarks Mr. Citroen paid a high tribute to the work of the Auto Cycle Union. He gave it as his opinion that the good work of the A.C.U. had a world wide effect upon the motor cycle, and the boom which was only beginning in Holland owed its origin mainly to the spade work of the A.C.U. He added that he believed that last year's Dutch trial was the forerunner of the Federation Internationale des Clubs Motocyclistes. The Dutch Club now had 700 members.

The Royal Dutch M.C.C.

In responding, Mr. Loughborough returned thanks for Mr. Citroen's flattering remarks, which he considered significant and sufficient incentive to Englishmen to support the A.C.U. in every way that lay in their power. He had been told that in Holland "Royal" was about to be applied to the Dutch M.C.C., so that at any rate Holland led in this respect. He assured the Dutch teams that they need not be afraid of the hairpins and the course which had been mentioned by the English captains.

Mr. Otto Thomas followed with the toast of "The Chairman," and spoke in flattering terms of the untiring energy of Mr. Nisbet in his work in developing not only motor cycles, but cycles and motor cars also. It was typical of Mr. Nisbet's work that whatever he did, he carried out thoroughly and without fuss. He devoted himself to sports in general from purely sporting motives, and his work was appreciated on all hands.

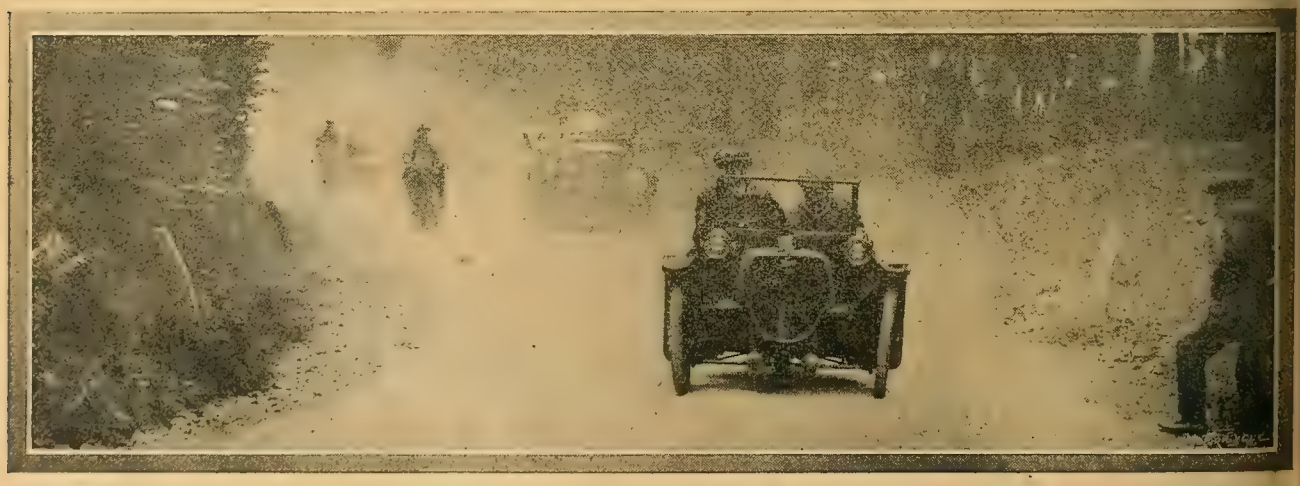
Mr. Nisbet briefly responded, and assured those present that it was sufficient reward for his labours that his work was appreciated. He had connected himself with all forms of sport, cricket, football, swimming, cycling, motor cycling, and the car world. He referred to the good work of Mr. Loughborough, and contended that the efficiency of his department accounted for the increase in the A.C.U. membership of 60 per month. Finally he gave away a manufacturer's "secret" in mentioning that at a meeting of the Manufacturers' Union, regarding competitions, it was unanimously agreed that the time was not ripe to abolish competitions, and, in short, the makers generally would support all events which the A.C.U., in its wisdom, thought fit to promote.

On Sunday the Dutch party trained to Brooklands to pick up their machines, their bags being looked after by W. A. Sale and W. Cooper. A late start was made, but nevertheless the run to Oxford was much enjoyed. Lunch was taken at the White Hart Hotel, Windsor, and tea at Henley. The Dutchmen expressed great admiration of the scenery along the Thames Valley. In the evening all the machines were stored at the Morris Garage, Oxford, and the finishing touches were made.

The Day of the Trial.

Monday opened dull and overcast, but the threatened rain fortunately did not materialise. The start was made at 9 a.m., quite a good crowd being present. Mr. Alec Ross acted in his usual capacity as starter, and Mr. J. H. Burley took the times. The teams, with their official numbers, are given hereunder:

E. 1. W. Cooper (2¾ Humber).
H. 2. A. L. Versluijs (2¾ Eijsink).
E. 3. F. A. Hardy (2¾ Douglas).
H. 4. J. H. Nieuwenhuijs (2¼ Vulkaan)
E. 5. Geoffrey Smith (2¾ Humber).
H. 6. J. van Frankenhuijsen (2¾ Douglas)
E. 7. F. Dover (3½ Premier).
H. 8. Joh. Ferwerda (5-6 F.N.).
E. 9. C. Lester (3½ P. and M.).
H. 10. J. M. Bergmans (4 Simplex).
E. 11. A. R. Abbott (3½ Rudge).
H. 12. A. Citroen, Kzn. (3½ Rudge Multi).
E. 13. C. W. Wilson (Morgan).
H. 14. Pseud "Eddy" (4 Simplex).
E. 15. R. G. Charlesworth (6 Zenith).
H. 16. S. Eweg (7 Indian).
E. 17. R. E. Guest (Matchless and sc.
H. 18. A. B. C. van Dongen (7 Indian and sc.)
E. 19. S. Wright (2¾ Humber).
H. 20. L. J. Knoops (2½ Eijsink).
E. 21. Reg. Holloway (2½ Premier).
H. 22. D. v.d. Mark (2¾ F.N.).
E. 23. W. B. Gibb (2¾ Douglas).
H. 24. Ijos Kerstens (2½ Vulkaan).
E. 25. W. Pratt (3½ P. and M.).
H. 26. J. C. Neurdenburg (3½ Rudge Multi).
E. 27. W. F. Newsome (3½ Triumph).



Competitors on Whitchurch Hill, C. W. Wilson (Morgan) leading.

J. M. Bergmans (4 h.p. Simplex), followed by Jos Kerstens (Vulkaan) and F. C. North (Ariel), on Station Hill, Wycombe.

28. A. Eijsink (3 Eijsink).
29. F. C. North (3½ Ariel).
30. P. N. Jelsma (3 Eijsink).
31. C. R. Collier (6 Matchless).
32. C. Witteveen (4½ James).
33. F. W. Barnes (6 Zenith).
34. P. Nieman (5-6 Simplex).
35. F. Smith (5-6 Clyno and sc.).
36. J. L. Geidt (6 Cyclonette three-wheeled cycle car).

Every chosen rider, according to programme, was present at the start, and as the teams had been fixed some weeks previously, this fact alone says something for the keenness with which the trial was fought out. Messrs. Cooper and Versluijs led off the ball on their Humber and Eijsink machines respectively, followed at minute intervals by the remainder. It was easily possible to distinguish the machines, as those from Holland carried orange number plates with black lettering, and the English machines carried green plates with white letters; a national flag also betokened the country of their origin. The route cards, which had been handed out the previous evening, did not disclose the true nature of the test, as reference to the test hills was carefully avoided.

First striking out to Shillingford, through Wallingford to Streatley and Pangbourne, the first hill was encountered, which is a long winding ascent. Here five Dutch competitors came to grief, making the sixth out to this point, as Van Dongen (7 Indian sc.) had to stop to make some trivial adjustment. The roads were frightfully dusty, and, owing to the continued drought, were extremely loose; in fact, the stones at certain points on the route made riding very difficult, and tested the skill of the Dutch riders, who were not used to this sort of work, to the utmost.

Failures at Nap and Kop Hills.

A long ascent out of High Wycombe and Nap Hill proved two teasers, especially to the Dutchmen. The last-mentioned hill was covered with loose stones, and is a narrow and winding ascent of single figure gradient. Here Mr. T. W. Loughborough, the clerk of the course, was busy noting down failures, and a long list he was able to compile, though only one was an English competitor, viz., A. R. Abbott, who was suffering from a slipping clutch. Kop Hill, Princes Risborough, was the test of the day, and here Mr. J. R. Nisbet, the judge, was stationed. No fewer than ten of the Dutchmen found it too stiff for their machines, Mr. Geidt's cycle car having to be pushed nearly all the way. As Pink Hill was descended, it further meant negotiating the half bend at the hill foot, and as it had to be taken on the run a great many heaved a sigh of relief when the top of Kop Hill was reached. We observed that the surface of the hill had deteriorated. The poor performances of the Dutch riders on the test hills was the result of not being geared low enough, and also not having had enough experience in the successful manipulation of the air lever in hill climbing. We noticed that quite a good number did not know what to do when their machines started to slow

F. W. Barnes (6 h.p. Zenith), followed by J. C. Neurdenburg (3½ h.p. Rudge), on Kop Hill.

A. Eijsink (3 h.p. Eijsink), the only Dutch rider to gain a gold medal.

Second International Reliability Trial.—

down. They get no practice on steep hills in Holland. A. Eijsink, on a machine of his own make, with outside flywheel, made a splendid ascent, and J. C. Neurdenburg (5½ Rudge) also shone conspicuously. A. Citroen had very bad luck in getting on to the very top of the hill over the worst gradient, and then being obliged to dismount. A. B. C. Van Dongen's 7 Indian sc. was climbing the hill at a splendid bat when it ran out of petrol. It appears that he had missed the course at one point, but how this was possible it is difficult to explain, as we can testify to the excellent marking of the route by Mr. W. A. Sale and another. Scores of arrows were used, and just as a reminder cards bearing "Links Houden" (Keep to the left) were constantly encountered. The loose stony surfaces were telling a tale upon the tyres, for quite a number experienced troubles. The Englishmen were riding most consistently, and were climbing the hills in first-rate style. R. E. Guest had to stop to fasten the locknut of his clutch, but the most serious trouble to the English team was when W. Cooper retired at the foot of Kop Hill, owing to the axle of his Mark 6 Armstrong gear twisting and breaking the fork end. Cooper had had the new type of gear fitted to an old frame, and the necessary anchor plates had unfortunately been omitted. This cost the British team eighty marks.

British Victory Assured.

The final stage of the morning run was through Wendover to Tring. Lunch was taken at the Rose and Crown Hotel, and there was some very close running to the time schedule at this point. One did not need to discuss experiences long to come to the conclusion that a British victory was practically assured, this year, at any rate. After an hour-and-a-half's wait, the competitors were sent off in the same order as at the start, the first hill being Ivinghoe, which was a stumbling block to those who had found previous hills too much for them. The course lay through Dunstable, Hockliffe, Leighton Buzzard, occasional up-grades and sharp bends being encountered, but there was little from this point to the finish, which was *viâ* Aylesbury and Thame, to worry any of the riders, and on the afternoon's run, except for one hill, the Dutch riders gained a good idea of the average English road. J. H. Nieuwenhuijs was riding along very comfortably on his Vulcaan-Terrot in front of us when his pulley dropped in the roadway; Fred Dover and ourselves only just missed running over it.

Owing to the fact that the course had been kept secret, there were not a great many spectators to witness the trial. Frank Smith had to ride forty miles with a flat back tyre, whilst the rear cylinder plug of Geoffrey Smith's 2¾ h.p. Humber ceased sparking on two or three occasions, and the rider had perforce to burn away the carbon as he rode along by making a spark gap between the end of the wire and the top of the plug. As it happened, this proved a valuable tip for him, for on time he was the nearest of all the competitors with 10⅘s. error, and gained several awards. When the results were made known at 7.30 p.m., after all the officials had met, it was found that the English victory was a pronounced one, the home team losing ninety-one marks compared to the Dutch team's 546.

BRITISH TEAM.

GOLD MEDAL WINNERS.

F. A. Hardy (2¾ Douglas).
Geoffrey Smith (2¾ Humber).
F. Dover (3½ Premier).
C. Lester (3½ P. and M.)
C. W. Wilson (Morgan).
R. G. Charlesworth (Zenith).
S. Wright (2¾ Humber).
Reg. Holloway (2½ Premier).
W. B. Gibb (2¾ Douglas).
W. Pratt (3½ P. and M.)
W. F. Newsome (3½ Triumph).
F. C. North (3½ Ariel).
C. R. Collier (6 Matchless).
F. W. Barnes (6 Zenith).
Frank Smith (5-6 Clyno sc.)

SILVER MEDAL WINNERS.

A. R. Abbott (3½ Rudge).
R. E. Guest (8 Matchless sc.)

DUTCH TEAM.

GOLD MEDAL WINNER.

A. Eijsink (3 Eijsink).

SILVER MEDAL WINNERS.

A. L. Versluijs (2½ Eijsink).
Joh. Ferwerda (5-6 F.N.)
A. Citroen (3½ Rudge Multi).
L. J. Knoops (2½ Eijsink).
D. v. d. Mark (2¾ F.N.)
J. C. Neurdenburg (3½ Rudge Multi)
P. Nieman (5-6 Simplex).

RESERVES.

SILVER MEDALS FOR NON-STOP PERFORMANCE.

W. B. Little (3½ Premier).
P. Newbold (6 Zenith).
Rex G. Mundy (3½ Triumph).
D. H. Noble (3½ Rover).
D. Arter (3½ James).

The complete results are as follow:

SPECIAL AWARDS.

SILVER CUP, presented by *The Moto Cycle*, for the best performance by trade rider, Dutch or English, W. B Gibb (2¾ h.p. Douglas).

SILVER TROPHY, presented by th Cycle and Motor Cycle Manufacturer and Traders' Union, for the best pe formance by an English private owne Geoffrey Smith (2¾ h.p. Humber).

SILVER CUP, presented by Mr. H. A Boom, for best performance by a Dutc rider A. Eijsink (3 Eijsink).

SILVER N.M.V. PLAQUE D'HONNEU for best performance by an Englis private owner, Geoffrey Smith (2¾ Hun ber).

BRONZE N.M.V. PLAQUE D'HONNEU for best performance by an Englis trade rider, W. B. Gibb (2¾ Douglas).

SILVER N.M.V. MEDAL D'HONNEU for the best performance by a Dutc private owner, A. Citroen (3½ Rudge Multi).

BRONZE N.M.V. MEDAL D'HONNEU for the best performance by a Dutc trade rider, A. Eijsink (3 Eijsink).

SILVER MEDAL, presented by Mr. A Citroen, for best performance by a English rider, Geoffrey Smith (Humber

SILVER MEDAL, for best performance b a Dutch rider on a Dutch machine, A Eijsink (3 Eijsink).

On Tuesday the riders visited Coventr (travelling *viâ* Stratford and Warwick at the invitation of the Coventry an Warwickshire Motor Club, and Messr Rudge-Whitworth, Ltd., at the sam time invited the teams to luncheon. Th Mayor of Coventry (Col. Wyley, V.D took the chair at the dinner, and subse quently a move was made to the Empir Theatre to see a film of the previous day trial. The Rudge and Triumph com panies added to the batch of souvenir received the previous day. On Wednes day morning the final stage was entere upon, the Dutch riders being escorted t Harwich, and given a hearty send off, a voting the trip a most enjoyable one.

TIME TO LIGHT LAMPS.

Aug. 7th	... ...	8.37 p.m.
,, 9th	... ...	8.33 ,,
,, 11th	... ...	8.30 ,,
,, 13th	... ...	8.26 ,,

"Object" or Policeman.

The following amusing paragraph has been sent to us by a reader residing in Natal: Charged with riding at an excessive speed, and asked why he had not stopped when ordered to by a policeman, a motor cyclist told the Court that "he saw an 'object' as he passed, but did not know it was a policeman."

New Racing Lightweight.

We hear that a racing F.N. lightweight will shortly be seen on the track. So many fine performances have recently been put up with engines of small cylinder capacity that it will be interesting to see how this shaft-driven machine fares against its rivals in the 350 c.c. class. The cubic capacity of the F.N. is only 296 c.c.

Hill-climb in the Midlands.

An open hill-climb will be held by the Sutton Coldfield and Mid-Warwickshire A.C. on the same date (in October) as the open reliability trial. The principal award will be the Levis Cup, kindly presented by Messrs. Butterfield Bros. There will be a fast and slow climb and a special prize for the slowest time of the day. It is hoped to make this event as popular as the Colmore Cup trial organised by the same club.

Special Prizes in Six Days' Trials.

The following special prizes have been offered, to qualify for any of which a competitor must have completed the trial:

(A.) A prize for the best performance by a team of three entered or nominated by a manufacturer, provided at least five teams are nominated.

(B.) A prize, offered by His Worship the Mayor of Carlisle, for the best performance by a team nominated by and members of an affiliated club, provided at least five teams are nominated.

(C.) A prize to each member of the winning team in the International Touring Trial.

(D.) A prize, offered by the Cumberland and County M.C.C., for the best performance in Division I. (Motor cycles).

(E.) A prize, offered by Mr. J. Wheatley, for the best performance in Division I. (Sidecars and three-wheeled cycle cars.)

(F.) A prize, offered by the Electrical Engineering and Motoring Co., Carlisle, for the best performance in Division III. (Four-wheeled cycle cars.)

FUTURE EVENTS.

Aug. 9.—B.M.C.R.C. Race Meeting.
,, 9.—Brookdale M.C.C. One Day Trial for Club Teams.
,, 9.—Liverpool A.C.C. Open Trial.
,, 9.—Nottingham and District M.C.C. Open One Day Trials.
,, 9.—Herts. County A.C. Open Hill-climb at Kop Hill.

,, 20.—Streatham M.C.C. Open Speed Trials at Brighton.

Reliability Trial in Italy.

The Circuito del Colle di Sestrieres took place last week, a distance of 310 kilometres being covered over various passes of the Alps near Turin. Bai Badino's performance was very meritorious. The following finished to schedule time: Pierino Alberto (3½ Borgo), Meldi (3½ Borgo), Cossu (3½ Triumph), Borgo (3½ Borgo), Fea Paolo (3½ Triumph), Tarlarini Enrico (3½ Sarolea), Bai Badino (2¾ Douglas), Scales (8 Zenith sc.), Bechis (3½ Singer), and Pregliasco (3½ Aetos).

SPECIAL FEATURES:

ANGLO-DUTCH TRIAL.
VICTORY OF BRITISH TEAM.
TWO NEW TWIN ENGINES.
ENTRIES FOR SIX DAYS' TRIALS.

Anglo-Dutch Trials.

The following additional subscriptions have been received:

Dutch Trial Souvenirs.

Our visitors from Holland have returned with many souvenirs of their trip, thanks to the initiative of Mr Frank Hardy and the kindness of the firms he approached. The following gave souvenirs:

The Anglo-American Oil Co., Ltd.
Horlick's Malted Milk Co.
Hutchinson Tyre Co.
R. Surridge and Co.
Stanley Belt Fastener Co.
F. E. Baker, Ltd.
Butterfield's (Levis)
Zenith Motors, Ltd.
British Petroleum Co., Ltd.
Rudge-Whitworth, Ltd.
Triumph Cycle Co., Ltd.
Bowden Wire Ltd.

ANGLO-DUTCH TRIAL C. Lester (3½ h.p. P. and M.), followed by a Simplex rider, on Shillingford Bridge.

M.C.C. Standard Reliability and Hill-climbing Trial.

THIS event was run off on Saturday and Monday last, starting and finishing at Hungerford, on the Bath Road. Of an entry of twenty-nine, there were three non-starters, and of these R. B. Clark had the misfortune to collide with a tramcar on the way to the start and break his thigh. The starters were:

W. P. Tippett (3½ h.p. Humber) and L. A. Bees (4 h.p. L.M.C.) on the lower bend of Porlock.

Rider and Machine.	Gear and No. of Speeds.
L. A. Baddeley (3½ h.p. P. and M.)	P. and M. 2-speed.
S. Tharp (3½ h.p. Triumph)	Sturmey 3-speed.
R. F. L. Crossman, R.N. (8 h.p. Zenith)	Zenith-Gradua.
G. T. Gray (5 h.p. Rudge)	Rudge Multi.
K. A. MacDonald (3½ h.p. Singer)	Sturmey 3-speed.
B. A. Hill (7 h.p. Indian)	Indian 2-speed.
E. A. Colliver (7 h.p. Indian)	Indian 2-speed.
C. Percival (2¾ h.p. Douglas)	Douglas 2-speed.
C. Macbeth (2¾ h.p. Douglas)	Douglas 2-speed.
S. G. Frost (2¾ h.p. Douglas)	Douglas 2-speed.
D. W. Popplewell (3½ h.p. Triumph)	Sturmey 3-speed.
H. A. Cooper (3½ h.p. Bradbury)	Sturmey 3-speed.
J. D. Drysdale (5 h.p. Hazlewood)	Armstrong 3-speed.
A. T. Stanton (3½ h.p. Bradbury)	Sturmey 2-speed.
M. C. Breese (3½ h.p. B.S.A.)	B.S.A. 2-speed.
R. M. Marians (3½ h.p. P. and M.)	P. and M. 2-speed.
H. Karslake (3½ h.p. Rover)	Armstrong 3-speed.
H. F. Edwards (6 h.p. Enfield)	Enfield 2-speed.
L. A. Bees (4 h.p. L.M.C.)	L.M.C. 2-speed.
W. P. Tippett (3½ h.p. Humber)	Sturmey 3-speed.
E. Kickham (2¾ h.p. Douglas)	Douglas 2-speed.
G. H. S. Letchworth (5 h.p. Rudge Sidecar)	Rudge Multi.
R. C. Davis (5-6 h.p. Clyno Sidecar)	Clyno 3-speed.
H. G. R. Slingo (5-6 h.p. Clyno Sidecar)	Clyno 3-speed.
A. J. Dixon (3½ h.p. Singer)	Sturmey 2-speed.
L. Martin (10 h.p. Singer Car)	Singer 3-speed.

The rules were exceedingly simple, being in effect that to make a standard performance a machine had to climb Porlock Hill at not less than a given speed and make a clean ascent of this hill, also Lynmouth, Barbrook, and Countisbury hills.

Saturday's Outward Route.

The route for Saturday was from Hungerford to Bridgwater, Minehead, Porlock, Lynmouth, Barbrook Mill, Watersmeet, and back to Lynmouth. The return journey was made *viâ* Lynmouth to Porlock, and then following the outward route, but in the reverse direction.

On the way down Baddeley had a nasty skid in Trowbridge, and Crossman suffered continuous tyre troubles, which eventually put him out of the running. In the neighbourhood of Philip St. Norton the dust was appalling, and everyone was soon looking like a miller.

After an excellent lunch at the Bristol Hotel, Bridgwater, a move was made for Porlock Hill, and competitors were timed on the run, over about 1,400 yards of the steepest portion.

Observations on Porlock Hill.

Observations showed that Baddeley assisted at the first corner, and Tharp assisted at both corners. Colliver fell at the first corner and was helped away. MacDonald fell, and made a clean ascent afterwards, being particularly good at the second corner. Percival fell, and afterwards legged heavily at the second corner. Alan Hill was very good. Macbeth failed at the first corner. Popplewell was good. Frost was splendid, and was easily fastest of the smaller machines. Drysdale fell. Stanton assisted with foot at the first corner, and was slow on the second corner. Breese legged, and failed on the second corner. Gray was fast. Marians stopped on both corners. Karslake was good. Edwards assisted at the first corner, and was very good at the second corner. Bees was baulked by Tippett on the first corner. Kickham was quite fast. Letchworth failed below the first bend with one mighty conk. Davis passed Martin on the first corner. Cooper skidded, but made a clean ascent. Slingo was good, but cut the second corner close. Dixon was good, and Martin was very good. At the top of the hill Breese experienced tyre trouble, and was late at Lynmouth.

After tea at Lynmouth, the hill had to be taken with cool engines, and all made good ascents excepting Macbeth, who ran alongside, above the first corner. Frost and Breese were very fine. The hill was in very good condition, which perhaps accounted for so many making clean ascents. A move was then made for Barbrook Hill, near which Edwards broke a chain

Barbrook Hill.

On this hill Baddeley skidded in the stones halfway up and fell. Sharp, Gray, MacDonald, Alan Hill, Colliver, and Percival were good, Macbeth ran, Frost skidded after climbing the steepest part and ran up the bank, Popplewell, Cooper, Drysdale, and Stanton were good, Breese nearly got up when his belt commenced to slip and he had to assist with his feet, Marians was slow, Edwards and Bees good, Dixon was fast, Tippett good, Kickham easily fastest and steady, Davis was not happy but his machine was going very well, Slingo good but not so fast as Davis, and Martin very fine.

Everyone then went on to Lynmouth for the finish of the day. Sunday was spent in visiting and admiring the local beauty spots, and all were in high spirits. The competition was voted a great success, and the idea that the event should combine a holiday and a competition was being carried out to perfection. The weather experienced was perfect throughout, and with the details carefully thought out by L. A. Baddeley, who had charge of the trial, everything was quite successful. This was the third year of the standard trial and hill-climb and the first time

H. G. R. Slingo (5 Clyno sc.) on the second bend of Porlock.

fine weather has been experienced. Instead of deep mud, thick dust and stones were the order of the day on hills.

Monday morning was cloudy and a young gale was blowing down Countisbury Hill. To decide the winners of the cups this hill had to be climbed at varying speeds, according to the classes in which the riders were entered. The time errors in seconds were :

Baddeley, 26⅝s. fast	Stanton, 10⅜s. fast
Tharp, 24⅛s. slow	Breese, 30s. fast
Crossman, 22⅖s. fast	Marians, 9⅘s. fast
Gray, 3s slow	Edwards, 5⅝s. slow
MacDonald, 54⅛s. fast	Bees, 35⅛s. slow
Alan Hill, 53⅛s. slow	Tippett, 6⅜s. fast
Colliver, 3⅛s. slow	Kickham, 16⅘s. fast
Percival, 102s. fast	Davis, 8⅖s. fast
Macbeth, 9s. slow	Slingo, 2⅖s. fast
Frost, 33⅛s. fast	Dixon, 22⅖s. slow
Popplewell, 64⅛s. slow	Martin, 0⅜s. slow
Cooper, 20s. slow	Karslake, 0⅜s. slow
Drysdale, 38⅜s. slow	

The distance timed was one mile of the steepest portion, with an average gradient of about 1 in 7. The run over Exmoor was trying, in consequence of the high wind, but it was soon over and forgotten. After leaving Minehead, punctures came thick and fast. Gray, Alan Hill, Davis, Kickham, and Martin, all fell victims, and to vary the monotony Hill had a choked carburetter. After leaving Bridgwater, Macbeth and Percival experienced trouble with their engines quite close together, but got going again after some delay. Then some speed was put on to get time in hand for a cup of tea at Trowbridge, and again Crossman fell a victim to the puncture fiend, a hefty three-inch nail doing the trick.

Finishing to Schedule Time.

After Marlborough, and quite close to the finish, Breese had another puncture, and rode the last two miles on the rim so as to finish to time. The following completed the course in time for an award :

L. A. Baddeley (P. and M.)	A. T. Stanton (Bradbury)
S. Sharp (Triumph)	M. C. Breese (B.S.A.)
G. T. Gray (Rudge)	R. M. Marians (P. and M.)
K. A. MacDonald (Singer)	H. Karslake (Rover)
B. Alan Hill (Indian)	H. F. Edwards (Enfield)
E. A. Colliver (Indian)	L. A. Bees (L.M.C.)
C. Percival (Douglas)	W. P. Tippett (Humber)
G. Macbeth (Douglas)	E. Kickham (Douglas)
S. G. Frost (Douglas)	R. C. Davis (Clyno sc.)
D. W. Popplewell (Triumph)	H. G. R. Slingo (Clyno sc.)
H. A. Cooper (Bradbury)	A. J. Dixon (Singer)
J. D. Drysdale (Hazlewood)	L. Martin (Singer c.c.)

In addition to the above the following finished to time, but had not completed the course : R. F. L. Crossman, R.N. (Zenith) and G. H. S. Letchworth (Rudge sc.). Subject to confirmation by the committee, the silver cup for the best performance on a solo mount goes to H. Karslake (3½ Rover).

In consequence of the passenger class not attracting sufficient entries the cup for this class falls through, the best performance being made by L. Martin (10 h.p. Singer).

SPEED TRIALS AT WIMBORNE.

The Bournemouth and District M.C.C. will hold their second annual open speed trials at Canford Park, Wimborne, on Wednesday, September 3rd, commencing at 1 p.m.

There will be the following classes :

Class I.—To 350 c.c.

Class II.—351 to 600 c.c.

Class III.—351 to 600 c.c., for riders who have never won an award in a motor cycle race.

Class IV.—To 1,000 c.c.

Class V.—Sidecars to 650 c.c.

Class VI.—Sidecars and three-wheeled cycle cars to 1,000 c.c., and four-wheeled cycle cars to 1,100 c.c.

The competition will be run off on the knock-out principle. The latest date for entries is August 25th, or at double fees August 27th

W. B. Tippett (Humber) and L. A. Bees (L.M.C.) further round the first corner (see previous page). The former, as will be seen, is in the act of skidding.

Final Regulations for the A.C.U. Six Days' Trials.

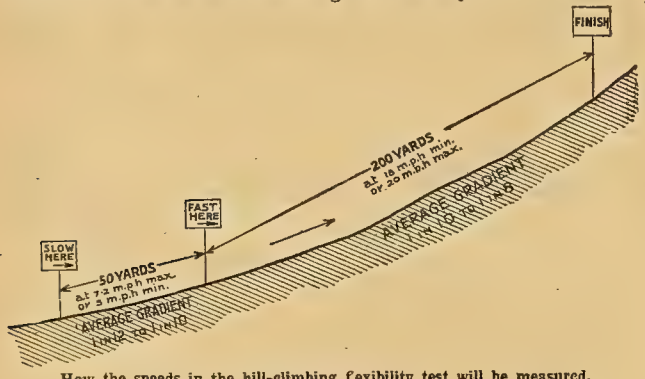
The Conditions for the Flexibility Test.

THE A.C.U. have issued the final regulations for the Six Days' Trials which commence at Carlisle on August 18th. They state that: 1. All machines entered for the trial, with their drivers and passengers, must be at the official storage depôt, the Skating Rink, Carlisle, not later than 9 a.m., Sunday, August 17th. Late arrivals may be disqualified. The competing machines will then be examined for compliance with the regulations as to classification, equipment and numbering; drivers, passengers, and machines, will be weighed, and frames, engines, and gear boxes sealed. Spare parts, packed in a separate receptacle, must be declared on the form that will be provided, and the receptacles will be sealed. Petrol and oil tanks should be filled prior to presentation of the machine.

2. Engines may not be started at any time during the trial within the storage depôt, nor may any replenishment of oil or petrol be made therein.

Competitors are earnestly requested to take every possible precaution against damaging the floor of the Skating Rink either by leakage of oil or otherwise.

3. Competitors only will be allowed to enter the storage depôt; passengers, friends, attendants, or trade representatives are expressly excluded at all times. A competitor will not be allowed to enter the storage depôt until fifteen minutes before his time to start, when any adjustment should be made within the building, and the machine then wheeled outside into the order of starting for the day.



FINISH
200 YARDS at 18 m.p.h. min. or 20 m.p.h. max.
FAST HERE
SLOW HERE
50 YARDS at 7.2 m.p.h. max. or 5 m.p.h. min.
AVERAGE GRADIENT 1 in 12 to 1 in 16
AVERAGE GRADIENT 1 in 12 to 1 in 16

How the speeds in the hill-climbing flexibility test will be measured.

4. Drive considerately in Carlisle. The schedule times are each day calculated from and to a point indicated by a notice board outside the town of Carlisle. Three minutes, both morning and evening, will be allowed between this point and the depôt. Therefore, at the start of each day's run, competitors will be despatched three minutes in front of schedule time, and, at the finish of each day, they should arrive at the above point at scheduled finishing time, and at the depôt three minutes later.

5. Spare parts, as defined in Prelim. Reg. 15, must not be made use of unless carried on the machine from the commencement of the trial. A breach of this regulation may involve disqualification.

6. Any competitor who may be prosecuted at law for excessive speed may, if the stewards are satisfied that he did drive at an excessive speed, be disqualified.

7. Marks will be awarded for the Flexibility and Speed Trials as follows:

The total number of marks that can be earned for the Flexibility and Speed Tests is 100. The Flexibility Trial will give a measure of *Acceleration* (25 marks), and, in conjunction with the Speed Trial, will also give measures of *Flexibility* (25 marks) and *General Utility* (25 marks). The Speed Trial alone will give a measure of *Speed* (25 marks).

The maximum number of marks of 25 under each of the above four headings is to be gained by driving over the slow portion of the Flexibility Trial at, at most, 7.2 m.p.h., and the fast portion at, at least, 18 m.p.h., and by attaining an average speed in the Speed Trial in accordance with the following table:

	Div. 1. Motor Cycles.					Div. 2. Sidecars and Three-wheeled Cycle Cars.				Div. 3. Four-wheeled Cycle Cars.	
Class	A	B	C	D	E	F	G	H	I	J	K
Engine capacity, c.c.	275	350	500	750	1000	350	500	750	1000	750	1100
Speed, m.p.h.	25	33.33	35.7	38.5	41.7	22.7	27.8	31.25	35.7	27.8	33.33

The length of the Speed Trial will be one kilometre, flying start.

The relation between Acceleration, Flexibility, General Utility, and Speed is expressed by the following formula, in which T_1 is the average speed in the Speed Trial, T_2 in the slow portion, T_3 in the fast portion of the Flexibility Trial:

		Max. Marks.
A. Speed	$=T_1$	25
B. Acceleration	$=\frac{T_3}{T_2}$	25
C. Flexibility	$=\frac{T_1^2}{T_2}$	25
D. General Utility	$=\frac{T_1{}_2}{T_2}$	25
		100

A competitor who fails in the Flexibility Trial or obtains less than the following minima will be credited with marks as follows for B, C, and D combined:
Div. 1, a min'm of 60 mks.
" 2, " " 55 "
" 3, " " 50 "

In the Flexibility Trial nothing is to be gained by driving at an average speed slower than 5 m.p.h., or faster than 20 m.p.h., in the slow and fast portions respectively. If a competitor stop in the Flexibility Trial, he will be allowed one more attempt; touching the ground with the feet will constitute a stop.

8. Marks will be deducted as follows:

(A.) Deviation from Schedule.

For starting late either in the morning or after the luncheon interval—one mark for every minute or part of a minute.

For passing any point of the route, eight minutes in the case of motor bicycles, or ten minutes in the case of passenger machines, in advance of or behind schedule time for that point—one mark for each of the said eight or ten minutes, and one mark per minute or part of a minute in excess of the said eight or ten minutes; provided that a deduction of marks under this regulation shall not be made more than once for any competitor in any morning or afternoon's run, and the maximum loss of marks due to deviation from schedule shall be limited to twenty in any one day.

(B.) Stopping in a Non-stop Section.

For stopping in a non-stop section—each stop four marks. The non-stop-sections are indicated on the profile and sketch maps, and will also be indicated on the road by means of notice boards. The road wheels coming to rest, except for exigencies of traffic, duly reported, or any breach of Prelim. Reg. 29, constitutes a stop.

(C.) Use of Spare Parts.

For each spare part taken from the spare parts receptacle—one mark.

(D.) Appearance.

For an excessively dirty or untidy machine or driver—one mark each day.

(E.) Defective Condition.

On account of the defective condition of any competing machine—not exceeding ten marks.

9. All official notices will be posted at the Central Hotel, Carlisle.

The Mont Cenis hill-climb took place on the 3rd inst., and resulted as below. A description and contour section of the Mont Cenis Pass were given in the issue of July 17th. The hill is over fourteen miles in length, with a maximum gradient of 1 in 10.

TOURING CLASS.—Iguera (Borgo), 22m. 58⅘s.

RACING CLASS.—250 c.c. : Semeria (S.I.A.M.T., 28m. 27⅕s. 350 c.c. : Riva (Motosacoche), 24m. 11s. 500 c.c. : Ponti (Motosacoche), 22m. 34⅗s. (fastest time of the day).

THE SCOTTISH TRIALS.

JUDGES' REPORT.

The report of the judges on the Scottish Trials has now been issued, and it contains the names of four additional gold medal winners. These are V. Busby (3½ h.p. Ariel), Mrs. Baxter (6 h.p. Rex), T. T. Laker (3¾ h.p. Elswick), and J. Steel (3½ h.p. B.S.A.). The judges are of opinion that a very much larger number of competitors would have won gold medals had they all adopted a more careful style of driving, especially on the numerous hairpin corners. They lay emphasis on the fact that broken frames were far too common, and suggest that in future it should be made impossible for a competitor to gain a gold medal if he finishes with a broken frame. Sidecar chassis also come in for castigation on account of weakness, but they point out that it was the newcomers to these trials who were the chief sufferers, as those who had been through before were able to anticipate weak spots and guard against them. They also point out that the twisting about and gymnastic performances of the passengers on hills should not be necessary, and contrast it with the normal position assumed by riders in the cycle cars.

The judges state that of the finishers only four changed their exhaust valves, which they characterise as a great improvement on past years, and they also find a word of praise for the really admirable behaviour of the competitors throughout the trials.

We have received a letter from Mrs. Hardee saying that she would like to convey her thanks to Sam Wright for his kindness in bringing her into Grantown on the last day but one of the trials after her bad smash caused by the bursting of her rear tyre. Many readers will be glad to hear that Mrs. Hardee has suffered no bad effects from her fall.

INTERNATIONAL CUP RACE IN FRANCE.

The race organised by the Automobile Club de la Sarthe for motor bicycles, sidecars, and cycle cars was held on Monday last, the day preceding the car event. The motor bicycles had to cover 201½ miles, six circuits of the course, and the sidecars and cycle cars 167½ miles. There were three classes for motor bicycles—250, 350, and 500 c.c.—two for sidecars—500 and 1,000 c.c.—and the awards were a cup for best time of the day, two challenge cups (one for motor bicycles and one for sidecars and cycle cars), and a silver medal for the winner of each class. There were forty-nine entries, and the whole of the competitors in each class wore different coloured armlets, and were started together from 8.30 a.m. onwards. The start of the circuit was situated on the main road from Mans to Tours at Hunaudières, and here were the grand stands and replenishment depots, where all petrol, oil, and replacement parts had to be taken up, and at no other part of the course.

Woodhouse, an Englishman, on a Clément, 500 c.c., led off the ball at 8.30 a.m., and the only other English rider was Greame Fenton, also on a Clément, in the 350 c.c. class. Woodhouse won his class, and the 500 c.c. sidecar class was won by a French rider of a B.S.A. The results were:

MOTOR BICYCLES.

350 c.c., Guilloreau (Terrot); 500 c.c., Woodhouse (Clément).

SIDECARS.

500 c.c., Delauné (3½ h.p. B.S.A.); 1,000 c.c., Vanella (7 h.p. Indian).

CYCLE CARS.

1,100 c.c., weight limited, Violet-Bogey; 1,100 c.c., weight unlimited, Ronteix.

It will be noticed that the French divide the cycle cars into two classes by weight, the limited class being 350 kilos = 770 lbs.

(1) A group of competitors starting. (2) J. W. Woodhouse (3½ h.p. Clement-M.A.G.), who won the 500 c.c. event.

BROOKLANDS AUGUST MEETING.

TWO solo motor cycle events, a sidecar race, and a cycle car race, all handicaps, were included in the Brooklands Racing Club's August Bank Holiday programme and, as usual, the two former were characterised by enormous fields. The Thirteenth Long Motor Cycle Handicap attracted no less than forty-one entries, of which thirty-three faced the starter, whilst in the Short Race thirty-seven out of fifty came forward. With so many machines on the track, it was naturally quite impossible accurately to trace the give and take of the races. A feature of the meeting was the congestion in the paddock and the large crowd on the test hill; the public appeared to greatly enjoy the racing, which was favoured by brilliant weather.

THE THIRTEENTH LONG MOTOR CYCLE HANDICAP. Distance, 8½ miles. Runners:

Rider and machine.	mm.	c.c.	H'cap. m. s.
Sidney George (2-cyl. Indian)	82½ × 93	994	scr.
E. Remington (2 Matchless)	90 × 77½	986	0 12
G. E. Stanley (1 Singer)	85 × 88	499	0 39
A. J. Brewin (2 Zenith)	90 × 77½	986	0 39
L. Hill (1 Rudge)	85 × 88	499	0 48
A. J. McDonagh (1 Rudge)	85 × 88	499	0 48
C. G. Pullin (1 Rudge)	85 × 88	499	0 48
H. A. Collier (2 Matchless)	64 × 77	496	0 54
Percy Butler (2 Scott)	2¾" × 2½"	486	0 54
J. Cocker (1 Singer)	85 × 88	499	1 3
L. G. Brown (1 Corah)	90 × 77½	493	1 24
Kenneth Holden (1 B.S.A.)	85 × 88	499	1 24
J. R. Haswell (1 Triumph)	85 × 88	499	1 24
S. Yano (1 Triumph)	85 × 88	499	1 36
J. A. Manners-Smith (1 Triumph)	85 × 88	499	1 36
George Roberts (1 Rudge)	85 × 88	499	1 36
G. W. Miller (1 Grandex-Precision)	85 × 88	499	1 36
J. W. Tollady (1 Singer)	85 × 88	499	1 36
R. B. Pullin (1 Rudge)	85 × 88	499	1 36
V. E. Horsman (1 Singer)	85 × 88	499	1 36
P. Brewster (2 Zenith)	70 × 54½	419	1 36
Noël H. Brown (1 Indian)	82½ × 93	497	1 36
E. N. Openshaw (1 Triumph)	85 × 88	499	1 36
F. G. Edmond (2 Humber)	60 × 60	340	2 6
W. A. Jacobs (1 Singer)	69 × 93	348	2 6
J. P. Le Grand (1 Singer)	69 × 93	348	2 6
H. Martin (2 Martin)	60 × 61	344	2 6
S. Halsall (1 Veloce)	76 × 76	345	2 33
M. Heinzel (2 N.S.U.)	54.4 × 75	349	2 33
E. E. Elwell (2 Douglas)	61 × 60	350	3 3
C. Starace (2 N.S.U.)	52 × 75	318	3 3
R. J. Bell (1 N.S.U.)	58 × 72	190	3 54

This resulted in an easy win by forty yards for Elwell (Douglas), who averaged a speed of 53½ m.p.h. Second, V. E. Horsman (Singer); third, P. Brewster (Zenith). H. Collier retired with a broken valve.

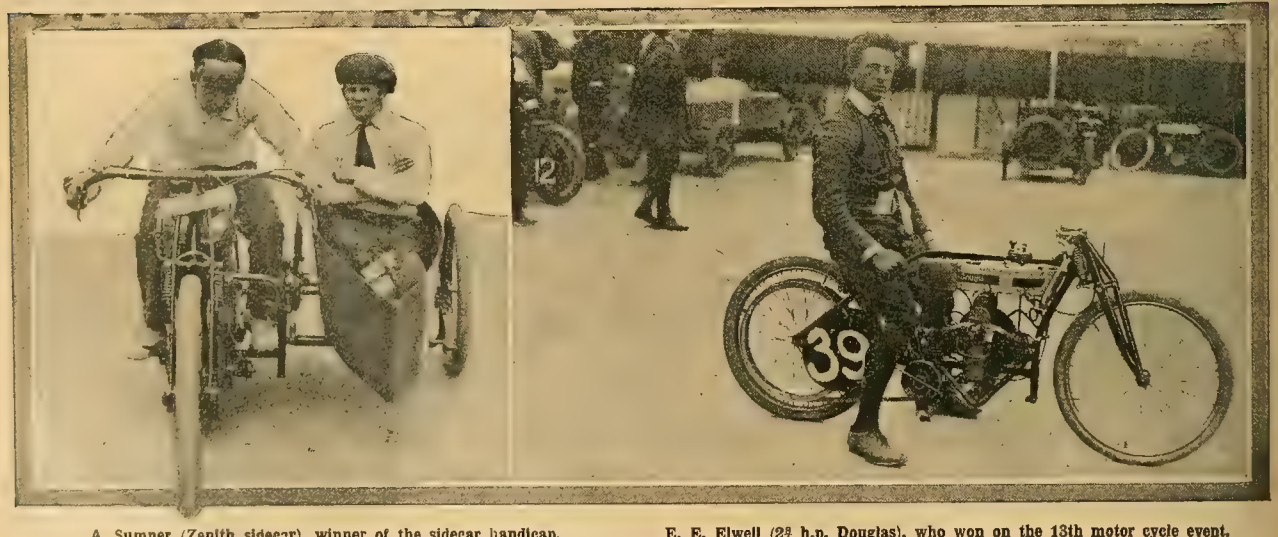
THE SIXTEENTH SHORT MOTOR CYCLE HANDICAP. Distance, 6¾ miles. Runners:

Rider and machine.	mm.	c.c.	H'cap. m. s.
Sidney George (2-cyl. Indian)	82½ × 93	994	scr.
G. E. Stanley (1 Singer)	85 × 88	499	0 26
A. J. Brewin (2 Zenith)	90 × 77½	986	0 26
L. Hill (1 Rudge)	85 × 88	499	0 32
A. J. McDonagh (1 Rudge)	85 × 88	499	0 32
H. A. Collier (2 Matchless)	64 × 77	496	0 36
J. Cocker (1 Singer)	85 × 88	499	0 42
L. G. Brown (1 Corah)	90 × 77½	493	0 56
Kenneth Holden (1 B.S.A.)	85 × 88	499	0 56
J. R. Haswell (1 Triumph)	85 × 88	499	0 56
S. Yano (1 Triumph)	85 × 88	499	1 4
J. A. Manners-Smith (1 Triumph)	85 × 88	499	1 4
George Roberts (1 Rudge)	85 × 88	499	1 4
G. W. Miller (1 Grandex-Precision)	85 × 88	499	1 4
J. W. Tollady (1 Singer)	85 × 88	499	1 4
H. Jepson (1 Zenith)	90 × 77½	493	1 4
W. J. Startin (2 Ivy)	60 × 76	430	1 4
P. Brewster (2 Zenith)	70 × 54½	419	1 4
R. B. Pullin (1 Rudge)	85 × 88	499	1 4
E. N. Openshaw (1 Triumph)	85 × 88	499	1 4
G. L. Haydon (1 Calthorpe)	70 × 90	346	1 4
J. E. Bird (1 Singer)	85 × 88	499	1 4
V. E. Horsman (1 Singer)	85 × 88	499	1 4
F. G. Edmond (2 Humber)	60 × 60	340	1 24
W. A. Jacobs (1 Singer)	69 × 93	348	1 24
J. P. Le Grand (1 Singer)	69 × 93	348	1 24
H. Martin (2 Martin)	60 × 61	344	1 24
G. Syme (1 Triumph)	85 × 88	499	1 24
S. Halsall (1 Veloce)	76 × 76	345	1 42
Max Heinzel (2 N.S.U.)	54.4 × 75	349	1 42
C. Starace (2 N.S.U.)	52 × 75	318	2 2
E. E. Elwell (2 Douglas)	61 × 60	350	2 2
W. H. Buckeridge (2 Douglas)	61 × 60	350	2 2
George Graff (2 Douglas)	61 × 60	350	2 2
G. S. Woodman (2 Douglas)	61 × 60	350	2 2
R. J. Bell (1 N.S.U.)	58 × 72	190	2 36

The result was a runaway win for Holden (B.S.A.), who was first home by 150 yards from A. J. Brewin (Zenith), and J. W. Tollady (Singer), the two latter being neck and neck; Stanley fourth and Jepson a close fifth. Speed, 65½ m.p.h. Buckeridge (Douglas) broke a driving chain.

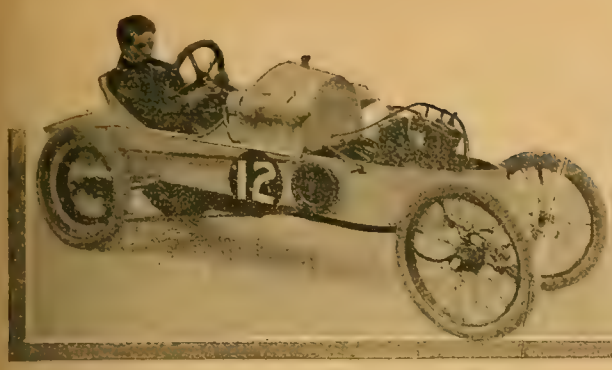
THE AUGUST SIDECAR HANDICAP. Runners:

A. J. Luce (2-cyl. Zenith)	90 × 77½	986	0 0
A. J. Brewin (2-cyl. Zenith)	90 × 77½	986	0 0
G. E. Stanley (1-cyl. Singer)	85 × 88	499	0 8
Kenneth Holden (1-cyl. B.S.A.)	85 × 88	499	0 36
H. Jepson (1-cyl. Zenith)	90 × 77½	493	0 40
A. Sumner (1-cyl. Zenith)	85 × 88	499	0 40
S. F. Garratt (1-cyl. Zenith)	85 × 88	499	0 40
V. E. Horsman (1-cyl. Singer)	85 × 88	499	0 40
J. Baxter (1-cyl. Armstrong-Villiers)	74½ × 80	348	1 38

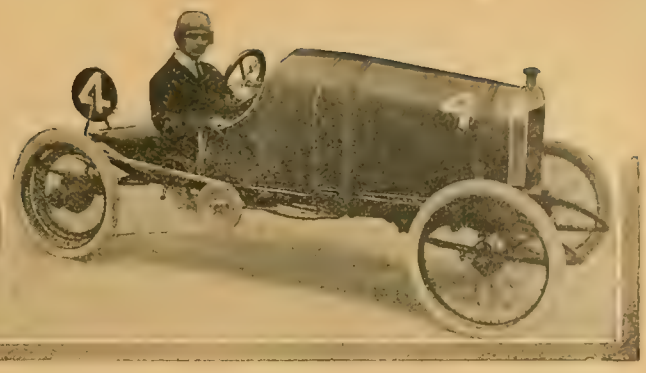


A. Sumner (Zenith sidecar), winner of the sidecar handicap.

E. E. Elwell (2¾ h.p. Douglas), who won on the 13th motor cycle event.



The Dew, runabout which won the second cycle car handicap.



D. C. Bolton on a new cycle car of his own construction with water-cooled Precision engine.

Before many minutes' running the result of this race was a foregone conclusion, as Sumner's Zenith was obviously the fastest machine and Jepson's the next. These two finished in that order, separated by 150 yards, with 300 yards between second and Kenneth Holden (B.S.A.) third; fourth, Luce (Zenith); fifth, Stanley (Singer); sixth, Garrett (Zenith). Baxter (Armstrong-Villiers) had trouble which caused him to stop in the second lap. Speed, 51¼ m.p.h. Some of the sidecars were laughable, one being a mere skeleton framework with a board for the passenger to sit on and a tubular footrest.

THE SECOND CYCLE CAR HANDICAP. Distance, 5⅝ miles. Starters:

B. Haywood (Singer)	63× 88	1,096	scr.	
G. W. Hands (Calthorpe) ...	62× 90	1,088	0	6
J. T. Wood (G.W.K.)	86× 92	1,058	0	18
D. C. Bolton (Bolton)	85× 96	1,090	0	18
G. Bullock (Winco)	86× 93	1,080	0	24
F. H. Ronksley (G.N.)	84× 98	1,086	0	32
C. M. Whitehead (G.N.) ...	84× 98	1,086	0	40
J. F. Buckingham (Chota) ...	89×120	747	1	16
A. E. T. Collins (Chota) ...	89×120	747	1	16
R. V. Patterson (Chota) ...	89×120	747	1	16
H. E. Dew (D.E.W.)	85× 85	964	1	20

The D.E.W. proved a very speedy little machine, and held the lead from start to finish, the only other machine showing any signs of challenging it being the Singer. Result:

1. H. E. Dew (D.E.W.).
2. B. Haywood (Singer).
3. J. T. Wood (G.W.K.).

Speed, 53½ m.p.h.

BIRMINGHAM TO EDINBURGH AND BACK RUN.

Twenty-five members of the Birmingham Club started for Edinburgh at two o'clock Saturday morning. Thick fogs and intense cold were the only objectionable features of the night ride. The course taken for the outward journey was *via* Nottingham and Worksop, joining the usual London-Edinburgh course at Doncaster; total mileage of the outward journey, 329 miles. Breakfast and luncheon stops were made at Doncaster and Appleby respectively, and it speaks well for the reliability of present day machines that all twenty-five reached Edinburgh inside the gold medal margin.

The only cycle car was the Alldays Midget, which performed creditably. There were seven sidecar turnouts and all finished well up to time at Edinburgh. There were no incidents of importance.

At 2 a.m. on August 4th, the first competitor was started from the Rossleigh Garage on the return journey of 295 miles, and as competitors were not allowed to touch their machines until half an hour before the start, many had a difficulty in getting away, and were seen scattered along the streets of Edinburgh making adjustments.

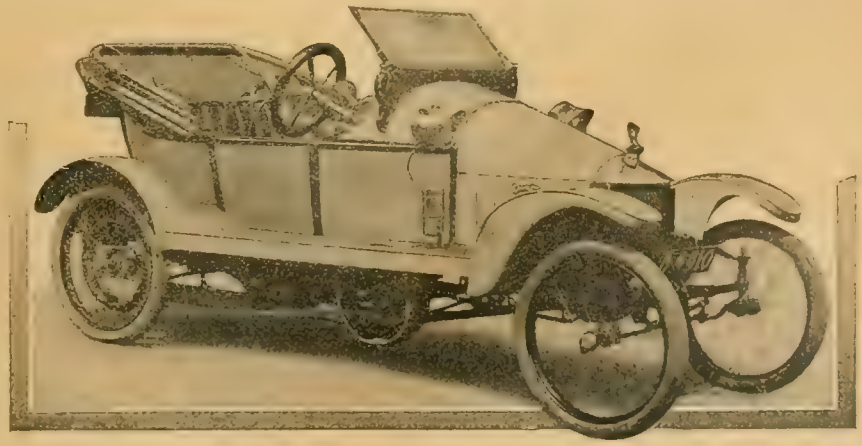
The morning was fine, and no fogs were encountered, the only drawback being the succession of acute bends between Edinburgh and Galashiels, which are dangerous in the dark. The breakfast stop was at Carlisle, where nearly all the riders arrived on time. The going was good the whole way, but on Shap T. Pollock (James) was encountered with his engine out of the frame, and T. Blumfield (Kerry-Abingdon) pushing his machine into Kendal.

Dinner was taken at Warrington, and competitors were glad to have passed through Preston and Wigan, with the awful paving and bumpy streets. The finish of the competition was at Streetly, and the following finished within the time stipulated to qualify for a gold medal:

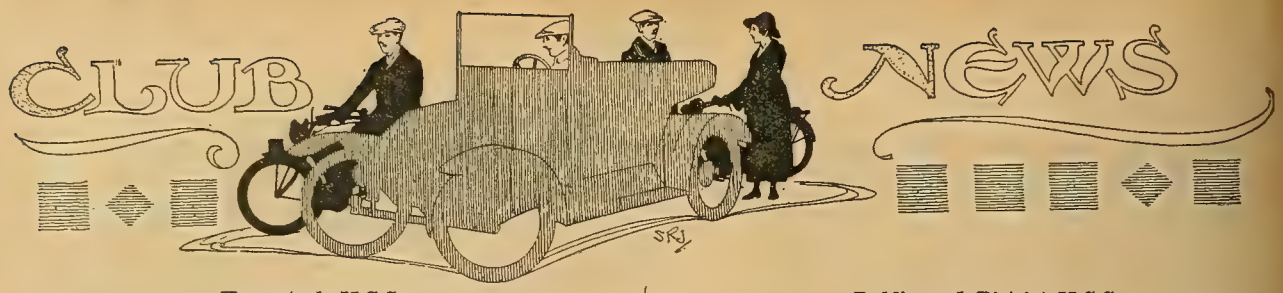
T. Silver (3½ Quadrant sc.)
H. Silver (3½ Quadrant sc.)
H. Ball (3½ Triumph)
S. C. Perryman (3½ Quadrant)
D. Brown (3½ Rover)
S. A. Rowlandson (3½ Rudge)
A. Young (3½ Abingdon)
E. H. Baker (3½ Monarch)
R. W. Duke (3½ Rover)
T. Pollock (3½ James)
C. Wilson (3½ Quadrant)
T. Peck (3½ Ivy)
J. Alldays (Alldays-Midget)
A. W. Sarsons (3½ Sun)
H. Hopkins (3½ Abingdon)
G. Dixon (3½ James sc.)
R. W. Lovegrove (3½ Raglan)
E. Longton (3½ Alldays sc.)
G. A. Lovegrove (3½ Raglan)
G. N. Norris (3½ Raglan)

Three teams finished complete, viz., the James, Quadrant, and Raglan.

D. Brown (Rover) rode for five hundred miles with his frame broken, and did remarkably well to get through.



An example of the Peerless cycle car which has a water-cooled engine. It is made by the Peerless Motor Company, Birmingham.



Haverstock M.C.C.

A garden party will be held at the Mitre, Barnet, on the 14th inst., when all motor cyclists will be welcome. Admission free.

Westmorland M.C.C.

The hill-climb which was to have taken place on the 21st inst. has, owing to the A.C.U. Six Days' Trials, been postponed till the 28th inst.

Essex M.C.C.

The twenty-four hours' ride from Woodford to York and back will take place on August 29th and 30th, starting from Snaresbrook at 7 p.m.

The route will be the same as in previous years, *viâ* Epping, Cambridge, and Alconbury Hill, where the Great North Road is joined, and then on through Grantham, Doncaster, and Ferrybridge to York.

Entry forms and full particulars may be obtained upon application to the hon. secretary, Mr. Harold Fuller, 51, Pulteney Road, South Woodford.

Ripon and District M.C.C.

Speed trials were held on the 26th ult. Results:

Single-cylinders (on formula).—1, A. S. Wells (3½ h.p. Rudge); 2, N. Barker (3½ h.p. Humber); 3, J. H. Taylor (3½ h.p. Triumph). Winner's speed, 59½ m.p.h.

Unlimited (on time).—1, A. S. Wells (3½ h.p. Rudge); 2, F. W. Taylor (3½ h.p. Rudge); 3, J. H. Taylor (3½ h.p. Triumph). Winner's speed, 60 m.p.h.

Passenger Class (on formula).—1, F. W. Taylor (3½ h.p. Rudge); 2, J. H. Taylor (3½ h.p. Triumph); 3, C. Kay (3½ h.p. Bradbury). Winner's speed, 43½ m.p.h.

Colchester and District M.C.

The results of the speed event held at Dedham on the 24th ult. were as follows, distance half-mile, flying start:

Tourist Trophy Class.—Mark Head (3½ h.p. T.T. Zenith), 29⅕s.; R. F. Richards (3½ h.p. T.T. Rudge), 30⅗s.; F. Braithwaite (3½ h.p. T.T. Rudge), 30⅗s.

Roadster Class.—R. F. Richards (3½ Rudge Multi), 37⅕s.; R. Armes (3½ h.p. Swift), 38⅕s.; Crosby (3½ h.p. Swift), 39⅕s.

Any machine up to 1,000 c.c.—Mark Head (3½ h.p. T.T. Zenith), 28⅕s.; D. W. Popplewell (3½ h.p. T.T. Singer), 30s.; F. Braithwaite (3½ h.p. T.T. Rudge), 30s.

Exeter and District M.C.C.

A twenty-four hour reliability trial took place from Exeter to London, from London to Plymouth (*via* Exeter), and from Plymouth back to Exeter, a distance of four hundred miles, on the 25th and 26th ult., for a cup and gold medal presented by Mr. E. Gould.

A very good entry was obtained, and eighteen competitors started from the London Inn Square, Exeter, at 8.30 on the Friday night. The riders experienced grand weather until within about twenty miles of Staines, where they encountered a heavy mist.

Mr. Gwynne (of the Motor Cycling Club) checked the times of the competitors on Staines Bridge, where thirteen arrived to time. After a wait of an hour and a quarter at the Bridge House Hotel a fresh start was made for the West. Twelve competitors arrived at Plymouth punctually. Twelve competitors finished to time. Results:

1. S. Saunders (Rudge), error 7m. 25s. Gould cup.
2. L. Mogridge (Mead-Precision), error 10m. 54s. Gold medal.

On the 23th and 30th of this month the club are holding another twenty-four hour reliability trial for a cup presented by Mr. E. J. Hancock, of Exeter. The course will be round the coast of Devon and Cornwall.

Dublin and District M.C.C.

The open reliability trial from Dublin to Glengarriffe and back took place on Saturday and Monday. The start took place from Inchicore Bridge at 6.30 a.m. on Saturday.

Oxford M.C.C.

The results of the reliability trial to Llandudno and back, which took place on the 5th and 7th ult., are now available: Winner of the bridge set, presented by the Birmingham Small Arms Co., Ltd., H. G. Watson, total error 5m. 2s.; gold medals, W. A. Mathews, F. L. K. Loxley, C. B. C. Loxley, and R. C. Davis; silver medal, C. J. Bellamy.

Public School M.C.C.

There was a run from London to Brighton and back recently. The members who joined the run should be commended for the punctuality of their attendance and arrival at Brighton. The running of Mr. Max Cremetti's lightweight Hazlewood was worthy of special note. He appeared to have no difficulty in maintaining the pace set by the big twin cycles and the performance of his machine was in every way praiseworthy.

York County M.C.C.

The second quarterly trials arranged by the above club were held recently. The course was *viâ* Harewood, Harrogate, Ripley, Pateley Bridge, Greenhow Bank, Grassington, Cracoe, Winterburn, and Malham, where competitors had an hour's stop for tea. The return journey was *viâ* Eshton, Skipton, Addingham, Otley, Harewood, and Moortown. The weather was fine, and two-thirds of the competitors completed the course to schedule time and without an involuntary stop. No mechanical breakdowns were reported, punctures being the main cause of failures. The roads in places were extremely rough.

Neville Newton (Rudge), winner of the Chesterfield M.C.C. Speed Trials last Saturday.

Club News.—

Islington and District M.C.C.

The result of the above club's non-stop reliability run, which took place on the 20th ult., was as follows: 1, H. Ward (4¼ Precision sc.), error 5 marks; 2, A. Uglow (2¾ Douglas), 7; 3, A. G. Peppercorn (3½ Bradbury); 10; 4, H. Thomas (3½ Triumph sc.); 5, A. A. Frith (6 Zenith); 6, F. Beck (3½ Ariel sc.).

Cumberland County M.C.C.

On July 26th a hill-climb was held on Whinlatter Pass. Results :

Singles.—1, W. B. Little (3½ Premier); 2, J. W. Moffet (3½ Singer); 3, W. T. Tiffen (3½ B.S.A.)

Twins.—1, R. M. Chaplow (2¾ Humber); 2, J. Glaister (5-6 Matchless); 3, W. Wilkinson (5-6 Clyno).

Fastest time of the day, W. B. Little (3½ Premier).

The annual trial to Harrogate and back took place on the 27th ult. The journey was made *viâ* Kendal, Settle, and Skipton in glorious weather. The Hilton Robinson Challenge Cup for solo machines was won by W. B. Little (3½ Premier); 2, J. W. Moffet (3½ Singer); 3, E. F. Gilbanks (3½ Rover). Other machines to lose no marks except on time were : G. Rutherford (2¾ Sunbeam), J. Robinson (2¾ N.U.T.), and J. Glaister (3½ Bradbury). The captain's cup for sidecar machines was won by W. Wilkinson (5-6 Clyno).

North Staffordshire M.C.

The reliability run for the President's Trophy Cup, given by Mr. James Cadman, was held on the 27th ult., over a course of approximately 180 miles.

Starting from Whitmore, the course lay through Market Drayton, Shrewsbury, Welshpool, Llanfair, Dinas Mawddwy, Bala (lunch stop), Lake Vyrnwy, Llanfylin, Oswestry, Ellesmere, Whitchurch, Audlem, Woore, and Whitmore.

The trial was run on the "go as you please" principle, there being no penalty for stops; but an average of 20 m.p.h., based on the shortest distance, had to be kept up. This was rendered most difficult, especially between Dinas Mawddwy and Bala, and from Bala to Lake Vyrnwy. The tracks ridden over could not be called roads; but, nevertheless, they were excellent tests for any motor cycle; every hundred yards between Bala and Lake Vyrnwy, gulleys were met ranging about six inches in depth.

Winners : H. Madeley (5-6 Rudge Multi), J. Sproston (2¾ Sunbeam), F. Tagg (3¾ Scott), G. Tagg (2¾ Douglas), and H. W. Teeton (3½ James).

Essex M.C.

The annual ride to York and back will take place on August 29th and 30th.

Cheltenham M.C.C.

The second of a series of reliability trials in connection with the Williams Cup was held on the 18th inst. Results :

Full marks (silver award).—A. W. Golesworthy (3½ Triumph sc.), W. B. Gibb (2¾ Douglas), and T. R. Trotter (3½ B.S.A.).

Non-stops were made by R. Moxon (2¾ Sunbeam), T. E. Farmer (2¾ Calthorpe), S. A. Sperry (3½ S.A.S.-Precision sc.), and F. Aguss (5 Rex sc.).

Walthamstow M.C.

A reliability trial of 250 miles was held from London to Yarmouth and back. The following competitors completed the distance to schedule and qualified for awards :

J. W. Percival (8 Chater-Lea sc.), W. A. Briggs (8 Chater-Lea sc.), D. Fairhead (7 Indian sc.), T. Danaher (4 Indian sc.), J. H. Kerr (6 N.S.U. sc.), H. J. Beal (4 L.M.C.), F. W. Applebee (3½ B.S.A.), and A. T. Peppercorn (3½ Bradbury).

Leicester and District M.C.C.

A very successful hill-climb was held at Nevile Holt Hill, near Market Harborough, on the 24th ult. The following is a list of the results :

Touring Class (up to 560 c.c.).—1, F. Snowden (3½ Rudge Multi); 2, H. W. Fowkes (3½ Green-Precision).

T.T. Class (up to 560 c.c.).—1, M. H. Simpson (3½ Rudge); 2, T. Nedham (3½ Martin-Jap); 3, J. J. Simpson (3½ Rudge).

Open Class (up to 1,000 c.c.).—1, T. Nedham (3½ Martin-Jap); 2, W. J. Glover (3½ Rover); 3, R. Wainwright (3½ Campion-Precision).

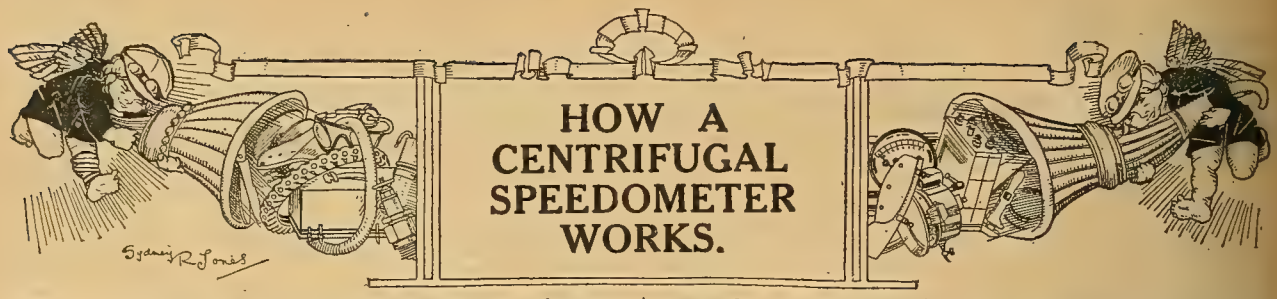
Sidecar Class.—1, H. W. Fowkes (3½ Green-Precision); 2, W. H. Chapman (5-6 A.J.S.); 3, F. Snowden (3½ Rudge Multi).

Handicap Class.—1, W. J. Glover (3½ Rover); 2, R. Wainwright (3½ Campion-Precision); 3, E. Folwell (3½ B.S.A.).

The fastest time of the day was made by M. H. Simpson, on a 3½ T.T. Rudge.

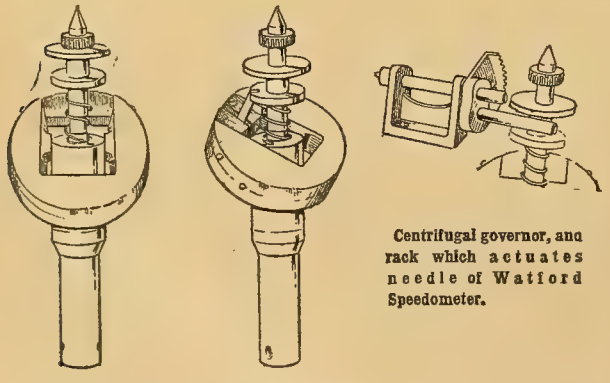
A reliability trial was held on the 17th inst. over a secret course of fifty-five miles. No watches or speedometers were allowed. The results were : 1, R. Wainwright (3½ Campion-Precision); 2, E. Folwell (3½ B.S.A.); 3, Harold Petty (3½ Singer).

A group of competitors leaving Thurso in the Scottish Trials. Among others may be seen G. L. Fletcher (Douglas), S. T. Tessier (Bat) A. U. R. Downie (A.J.S.), Mrs. Baxter (Rex) and W. Peatt (P. and M.)



HOW A CENTRIFUGAL SPEEDOMETER WORKS.

FOR the past two years I have been using a Watford speedometer, made by Nicole, Nielsen and Co. As it was one of their earliest motor cycle models, they wrote to me the other day and asked me to call at their works in Watford and have it tested. My visit proved so interesting that I am recording some of my impressions. Some of our readers may be ignorant of the very simple principle on which centrifugal speedometers work. The first sketch shows the heart of the mechanism, namely, a centrifugal governor. The long spindle has a socket and cotter hole at its thick end by which it is attached to the driving-shaft. The lower cone runs in a ball bearing, and the upper point is also the cone of a ball bearing, which is less than 9-32in. in diameter, *i.e.*, much smaller than a threepenny bit; this cone is hardly larger than the tip of a carburetter float needle. Midway up the spindle, a heavy white metal disc is swung on two pins; one side of it is anchored by a tiny flat link to the sliding collar. A small spring threaded over the spindle normally presses this collar up towards the top of the spindle; the collar thus hauls on the link joining it to the white metal disc, and causes this disc to assume a tilted position when the mechanism is at rest, as shown below. But when the gears on the front hub set the driving-shaft spinning, the spindle



Centrifugal governor, and rack which actuates needle of Watford Speedometer.

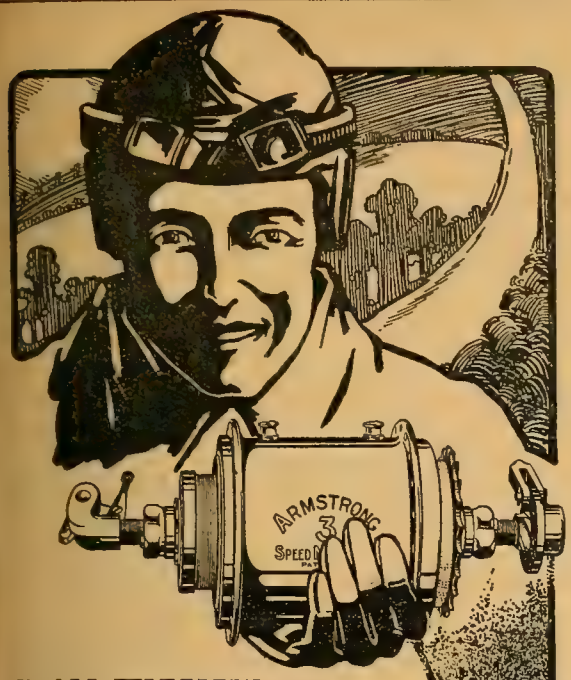
spins too, being rigidly connected to the driving-shaft; and the faster the spindle spins, the more the white metal disc tends to assume a horizontal position, see second sketch, for centrifugal force acts upon it, just as it does on the stone tied to a string which the village urchin swings round his head. Thus the collar D rises and falls in exact proportion to the speed of the machine. Its changes of position are easily registered by the needle on the dial by means of the small rack, illustrated, which is bolted inside the speedometer casing. This consists of a bracket carrying a spindle on which a toothed rack is eccentrically mounted; and the toothed rack carries a rod, which lies between the flanges of the sliding collar. Thus the *vertical* motion of the centrifugal governor is converted into an *oscillating* motion, capable of being registered by a needle on a dial. The mileage discs, whether "trip" or "season," are operated by clock work from the tiny pinion just below the tip of the spindle, which drives clock wheels geared with figured dials, of which one digit shows through the orifices cut in the face of the instrument. It is interesting to notice that the reduction between the driving spindle and the mileage dials read by the rider is no less than 3,720 to 1, and is obtained by two worm and two toothed reductions.

Testing the Speedometer.

The whole of the myriad tiny parts utilised in the instruments are made at the Watford works, the bearing balls being the only detail bought ready made. The parts are counted for store and issuing purposes by a counting machine, and are assembled by girls. After assembling, the instruments go into the inspectors' room, where they are closely scrutinised before calibration. The testing stand is most interesting. It consists of a huge stand, on which is mounted a number of master speedometers and extra driving-shafts, all driven at exactly the same speed, while steel friction discs afford the necessary reductions for testing an instrument's accuracy at any speed from 1 to 100 m.p.h. The readings of these master dials are tested daily against the best stop watches. As each instrument passes the mechanical inspector, it is coupled up to the calibrating stand, and run against the master dials. If it shows the least deviation from their readings, or if its needle waggles, it is sent back. I was given a first-class stop watch, and the run of the room, with permission to select any freshly assembled speedometer I saw on the trays, couple it to the running shafts, and test it both against the watch and the master dials. I soon found that there could be no question of inaccuracy, other than that arising from the tyres of motor bicycles being of incorrect diameter.

The equipment of machines required to manufacture such a small accessory would astonish any inexperienced visitor. For instance, the grinding machines are as large and heavy as those used for grinding the crankshaft of a six-cylinder engine. The vibration arising from smaller and lighter machines would render it impossible to work down to the accurate limits required for such delicate work. Two men are completely occupied in making and tempering the tiny springs supporting the governor collars, so large is the output. Some interesting side lines emanating from the same factory included a colossal electric syren for dock use, and a taximeter designed to defeat the ingenuity of any "cabby."

IXION.



Still WINNING!!!

—the HUB GEAR scores every time! We like competitions because every one means still another RECORD for the World-famous

"ARMSTRONG" MOTOGEAR

—Expert riders always choose The ARMSTRONG—results tell WHY!—Note these results in the

SCOTTISH 6 DAYS' TRIALS

¶ Of the 115 entries, 19 machines were fitted with ARMSTRONG 3-speed GEARS, and out of these

11 GAINED GOLD MEDALS!!

¶ The machines fitted with ARMSTRONG MOTOGEARS gaining GOLD MEDALS were

MORE THAN DOUBLE ANY OTHER MAKE!

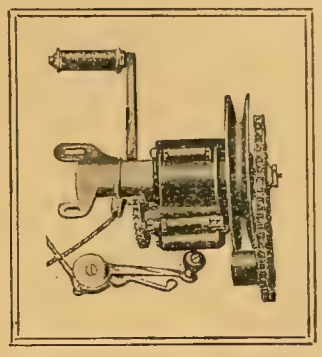
Won on an Ariel machine fitted with "The Armstrong" MOTOGEAR!! —How's that for efficiency and reliability? Keep your eyes on the English 6 Days' Trials!!

The ARMSTRONG 3-Speed GEAR Co., Ltd., BIRMINGHAM.

FIRST AND BEST

R.H.S.

Bowden Two-speed Gear



Enthusiastic Users.

It may be that the fact that the Bowden Gear has not been very prominently used in competitions, and that, comparatively, there are few met with on the road, has been detrimentally construed by the motor cycling public. The simple truth is that our chief business is the manufacture of BOWDEN CONTROLS, and the magnitude of this business is such as to practically monopolise the manufacturing facilities at our command. The Gear itself, in conception, design, and construction is really excellent, and the testimony below is a sample of very many received from users of the Gear.

Bishops Auckland,
19/7/13.

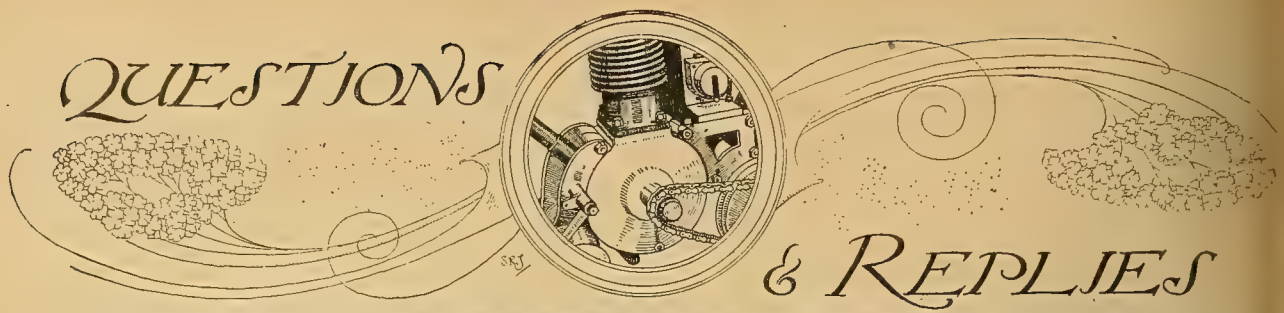
Dear Sirs,

.....I must say in the whole of my motor cycling experience I have never before met with such prompt and generous treatment. As regards the gear, I think it is perfection, and whilst being very simple in construction, it is very effective and very strong. I am recommending it to my friends. Yours faithfully,

F.H.

The gear fits to existing machines; in the chain-belt transmission, an 8in. pulley is embodied; and the price is £10 10 0. Complete gears, with special brackets for fitting to Triumph, Bradbury, B.S.A., etc., with engine sprocket bored, at £11.

Bowden Wire Ltd., Pratt Street, Camden Town, London.



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Petrol Consumption Formula.

I shall be obliged if you will send me a formula for working out the petrol consumption test for sidecar and solo machines running together. The weight of machine and rider and the distance covered are known, and all machines were served with the same quantity of petrol.—J.J.C.

We recommend the following formula (the A.C.U.):

$$\frac{W \times M \times X}{P}$$

W = total weight; M = miles covered; P = petrol (in ozs.); $X = \frac{C - 200}{1600} + 1$; C = cubic capacity.

Correct Method of Driving.

I am an interested reader of your paper, and shall be much obliged if you will answer me the following questions: (1.) What jet in a B. and B. carburetter would you recommend for an 85×85 single-cylinder 4 h.p. J.A.P. engine? (2.) My machine starts better and quicker when I do not flood the carburetter than when I do. What is the reason of this, and is there something wrong? (3.) My engine is inclined to knock when starting and when slowing down for corners. I have put a new belt on, and it is a bit tight. Will this be the reason? (4.) Which method do you recommend for steadying down to turn bad corners, to lift the exhaust valve or use the magneto switch?—G.W.T.

(1.) The best size jet for all-round work for the engine you mention is No. 32. (2.) The probable reason why your machine starts better when you do not flood the carburetter is that you have probably too rich a mixture when it is flooded, and require more air. (3.) Your belt being too tight is quite a likely reason for the engine knocking after slowing down. It is not necessary to run a rubber belt as tight as a leather one, and it is better for the belt and the engine to have a certain amount of slackness, provided no slip takes place. (4.) The correct way to drive in slowing down at a corner is to shut your throttle and avoid using the exhaust lifter as much as possible, as the valves last infinitely longer when this course is adopted.

Crossing London.

I shall be obliged if you will kindly send me (1) the best way from Colwyn Bay to Lambeth, S.E., and (2) the same from Cheadle, Staffs, in both cases avoiding all possible traffic, especially in London.—C.W.S.S.

Your best routes would be as follows: (1.) Colwyn Bay, St. Asaph, Wrexham, Whitchurch, Wellington, Bridgnorth, Kidderminster, Bromsgrove, Headless Cross, Alcester, Stratford-on-Avon, Banbury, Buckingham, Aylesbury, Amersham, Uxbridge, continue towards London as far as the G.W.R. bridge beyond Southall, and here turn right, following the road marked in blue on the R.A.C. Official Map of Recommended Routes Round London (which can be obtained from these offices, price 1s. 7d., post free) until you get to Kingston. Go up Kingston Hill and continue absolutely straight on through Wandsworth, Clapham, and Kennington to Lambeth. There is a deal of traffic from Clapham onwards which is not avoidable. (2.) To get from Lambeth to Cheadle, make your exit by the same route by which you entered London, and follow the blue road as far as Barnet, then go through St. Albans, Dunstable, Towcester, Weedon, Daventry, along Watling Street till you reach a point just beyond the village of Weeford, near Lichfield, then go through Abbots Bromley, Uttoxeter, and Cheadle.

Engine Running Hot.

I would be glad if you could diagnose a trouble which I have experienced recently with my 2¾ twin 1913 motor cycle. It has done about 1,600 miles, and I had it dismantled for the purpose of removing what carbon deposit there might be. On re-assembling it I find that it heats right over the crank case and timing gear, and even the magneto and inlet pipes become very warm. The carburetter is certainly giving too rich a mixture, and I am having this remedied, but the peculiar thing is that the heat seems to generate in the front cylinder and work backwards.—SCOTSMAN.

Unless the engine is actually overheating there is no cause for you to worry. The heat in the crank case may be solely through conduction. It may be due, however, to the piston rings not fitting properly and allowing the charge to leak into the crank case. We presume, of course, that the engine is not losing power on hills. This is really the only overheating which need worry you. Examine the fit of the piston rings carefully.

The above reproduction is from a postcard received last week which bears the following inscription on the back: "With the compliments of the Motor Club of S. Joao d'El Rey, Minas Geraes, Brazil."

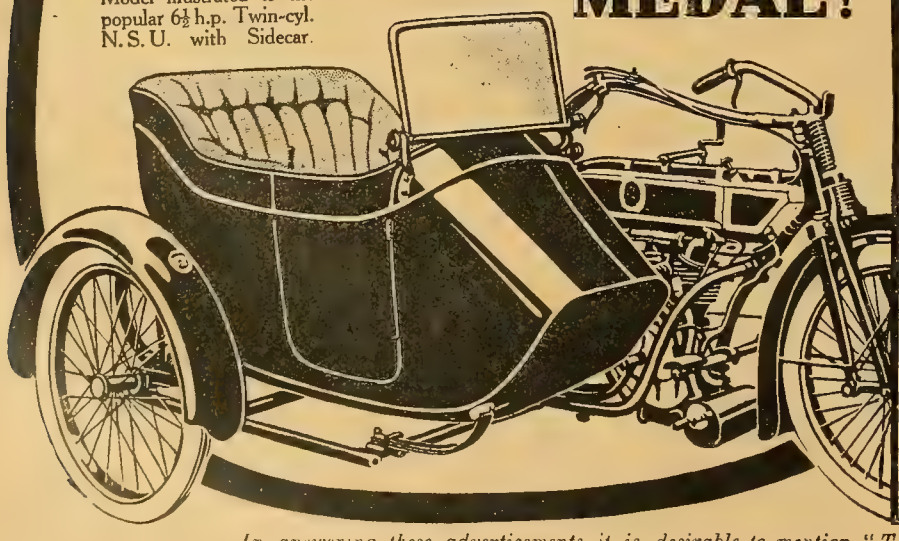
N.S.U.

Another GOLD MEDAL!

Model illustrated is the popular 6½ h.p. Twin-cyl. N.S.U. with Sidecar.



The Essex M.C. Club's Run from London to Yarmouth provided another opportunity for the N.S.U. to prove its reliability, Mr. J. C. Kerr, riding a 6½ h.p. Twin-cylinder N.S.U. and Sidecar, securing a GOLD MEDAL.

MODELS:

2 h.p. Single cylinder, with adjustable pulley	£34
3 h.p. ditto ditto	£43
3 h.p. Twin cylinder, with adjustable pulley	£45
6½ h.p. ditto ditto	£58

The N.S.U. TWO-SPEED GEAR AND FREE ENGINE PULLEY is ideal for sidecar and hill work. Ask one who knows! Fits almost any machine.

Stephen Raynes, winner of the Hutton shield in the Sheffield and Hallamshire M.C.C. reliability trial to Holyhead and back, a distance of 316½ miles. He rode a 1910 pattern Triumph and finished without losing a single mark.

Pre-ignition and Oil Leakage.

[?] I am in trouble with my 3½ h.p. 1910 Rex. This machine will go up a long hill at a good pace, but suddenly stops. I have the feeling during this stopping that something is sticking in the engine. The queer part is that it will start away again all right without waiting more than one minute. This is repeated at each long hill. The crank case leaks oil freely, but the trouble manifests itself even with the exhaust smoking badly. I have had the engine down to try and cure the oil leakage. I put the engine together hurriedly again, and it did not stop all that day. Before fitting the cylinder again on this occasion I filed the end of the piston rings slightly; even then they caused some trouble in getting them into the cylinder. I am now disappointed to find that, after taking down again to pack the crank case and cylinder joint, it develops this stopping trouble again. The engine does not overheat to any serious extent. Gear about 5 to 1; bearings in good order. The machine does about 25 m.p.h. on the level, with a slight opening of the throttle and three-parts air. Can you advise me on this? Would you suggest further filing of the rings? The connecting rod has been recently straightened correctly. Another trouble is that I cannot cure oil leaking at the cylinder joint. Repairers have tried without success. The lip of the cylinder has too small chips front and rear of cylinder.—D.A.R.

Without examination it is almost impossible to locate your trouble, but in all probability it is caused by pre-ignition. A particle of carbon or small sharp metal edge will often become incandescent when the throttle is opened for any distance, and will cause a stoppage very like a seize, though of course the engine will still be free. Clean out the cylinder head, valve pockets, and piston. If you suspect a partial seizure, a bearing may be too tight. Try liberal lubrication. It is possible, but unlikely, that the rings are too tight. The chips out of the cylinder base would probably account for the oil leakage. However, if the base of the cylinder and top of crank case are quite flat a paper and gold size joint should prevent leakage. The trouble may be due to too much pressure in the crank case owing to a faulty or small release valve.

Crossing to Germany.

[?] I am anticipating spending a week's holiday on a motor cycle tour in Germany, travelling *viâ* Harwich to the Hook of Holland. Noticing that you give some excellent replies to readers, I shall be glad if you could advise me: (1.) What would be the cost of conveying a motor cycle from Harwich to the Hook of Holland? I am not a member of the A.A. and M.U. or A.C.U. Also, how can one procure a licence, number plates, etc., when travelling on the Continent? (2.) What is the etiquette of the road for Holland and Germany? (3.) Could you suggest a reliable guide book, or books, for use in Holland and Rhineland?—S. J. H.

The Hook of Holland is certainly one of the best routes for reaching Germany. Motor cycles are taken across for 4s. 6d., or 10s. 6d. with sidecar attached. (1.) We should strongly advise you to become a member of the A.C.U. (89, Pall Mall, S.W.), or the A.A. and M.U. (Fanum House, Whitcombe Street, W.), and get the touring department of one of these institutions to work out your route for you. They will also arrange about your licence. (2.) In Holland and Germany all vehicles keep to the right. (3.) Baedekers are about the best guides you can purchase.

Licences for Petrol Storage.

[?] I have taken out an Excise licence for the sale of petrol. The Excise authorities approve of the place of storage, and the Sanitary Inspector for the local authority also approves of the storage arrangements but claims that I ought to take out a licence to store petrol under the Petroleum Act, 1871. Will you kindly tell me if it is necessary to take out a 5s. licence from the local district council for the storage of petrol? The locality in which I reside is a scattered village of 1,200 people, and I have less than sixty gallons stored in two-gallon tins.—J.S.

We have submitted your letter to our legal adviser, who replies as follows: "I gather that your correspondent sells petrol. If this is so, then in addition to the Excise licence for the sale of petrol he must take out a licence from the local authority. The fact that he does not store more than sixty gallons and that these are stored in two-gallon tins makes no difference, as the regulations exempting persons from the necessity of taking out a licence from the local authority do not apply where the petrol is kept wholly or partly for sale."

EXPERIENCES WANTED.

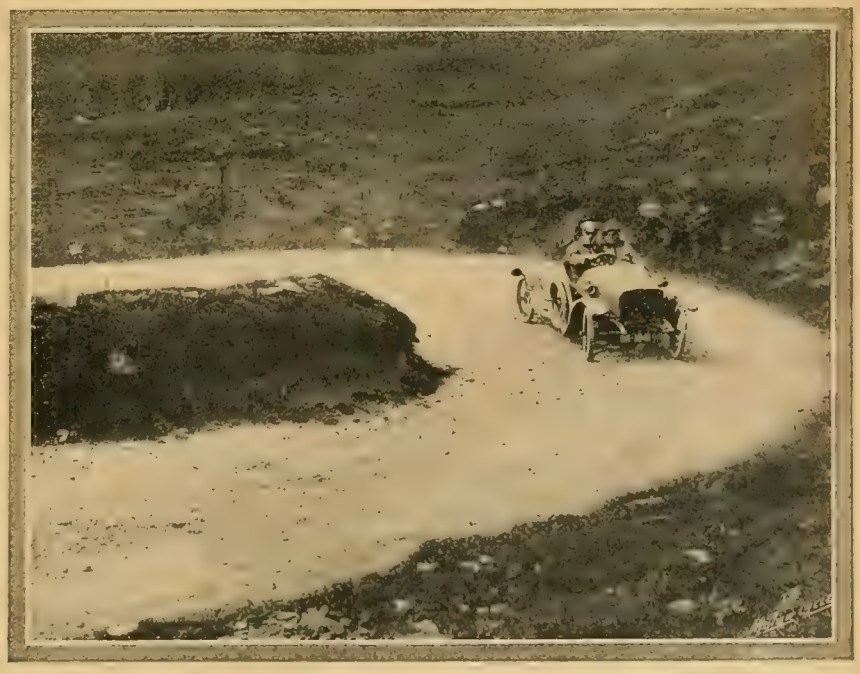
"F.G." (Erdington).—Wear of Clincher De Luxe tyres, No. 238.

"Colonial" (Surrey).—Levis two-stroke, and its suitability for South African roads.

"W.H.J." (Bagshot).—3 h.p. Royal Enfield. Lubrication and firmness of cylinder holding down bolts.

"J.H." (Petersfield).—F.N. or similar English machine. 4-5 h.p. for sidecar or solo work. Reliability, consumption, etc.

If "D.H.B." and "W.F.E." will comply with our regulations and forward stamped addressed envelope they will receive answers to their questions.



SCOTTISH SIX DAYS' TRIALS.
J. Y. Wood (8 h.p. G.W.K.) on the first bend of Amulree. Mr. Wood was awarded the special prize for the best performance on a passenger motor cycle.

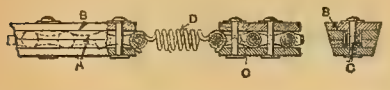
PATENTS

BY

ERIC W. WALFORD, F.C.I.P.A.

A Composite Driving Belt.

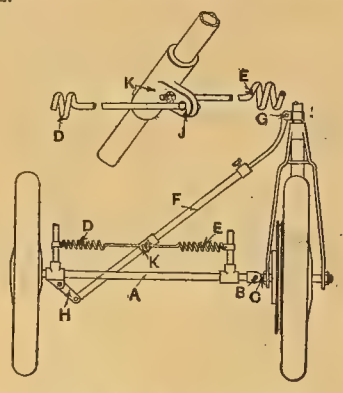
The chief objection to chain-drive as employed on motor cycles is its lack of elasticity, and the same failing arises in those composite transmitters which are built up on a chain foundation. The inventors of the constructions shown state that this difficulty is overcome, in a



motor belt, if this is made in three parts connected together by springs. Accordingly they employ a roller chain A, to which are attached friction surfaces B, the rivets C for which pass between the chain links. Three lengths are employed, connected together by springs D, the chain preventing stretch and fracture, whilst one spring connection is always available to absorb the engine shocks.—A. E. Lowenthal and T. Bettney, No. 13,172, 1912.

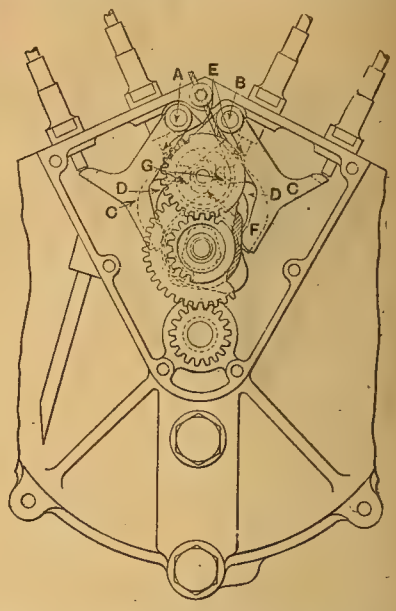
A Sprung Sidecar Axle.

The axle A is pivoted at B to the rear lug C fixed to the frame of the machine. It is therefore free to rise and fall in relation to the latter, and this movement takes place under the restraint of springs D and E. A diagonal stay F is provided, which is pivoted at G to the machine at one end, and at the other end is attached to a link H having a pivotal connection with the axle A. The springs D E are attached to frame members of the sidecar, and can slide through a lug J on a collar K fixed to the diagonal stay F. On the axle lifting, the link H yields to the movement, and the spring E, being stretched, absorbs the shock, the spring D absorbing the jar in the reverse direction.—T. D. Sinclair, No. 10,033, 1912.



Valve Operating Mechanism.

For twin-cylinder engines a single inlet and a single exhaust cam are used, and there are employed a pair of forked rockers pivoted at A and B. The outer half of each rocker is T-headed, the upper end engaging the exhaust valve tappet, whilst the lower end engages the exhaust cam, and the other half of each rocking lever is curved at the extreme ends engaging inlet valve cam, whilst at about mid point of their length they



engage the inlet valve tappets E. Compression release mechanism is also combined with the valve mechanism, and for lifting the exhaust valve the cam F is rotated, engaging the noses G on the rockers.—J. A. Prestwich, No. 22,135, 1912.

Notice of Removal.

We are informed by Messrs. Crescent Motors, Ltd., that they have now moved to larger works, and that now all communications should be addressed to them to Britannia Works, Rolfe Street, Smethwick, Birmingham.

Cycle Car Agency.

Messrs. Averies-Ponette, Ltd., Englefield Green, Surrey, inform us that they are anxious to appoint a selling agency for the London district for their cycle cars. Any firm interested should write Messrs. Averies-Ponette, Ltd.

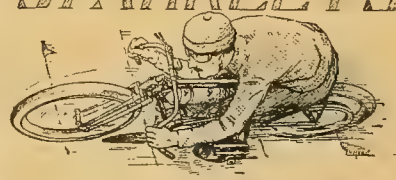
Records and Tyres.

When E. B. Ware broke eight records in the recent six hours' race at Brooklands on his Zenith and sidecar, he was riding on Clincher "Dreadnought" tyres, which, despite the severe strain to which they were subjected, gave no trouble.

Rubber Goods for Motor Cyclists.

A visit to the works of Messrs. Alfred Roberts and Sons, Ltd., St. Mary's Row, Birmingham, a few days ago was full of interest. This firm is putting up boxes of rubber washers for motor cycle generators moulded to suit Lucas, P. and H., and other lamp generators. The Roberts moulded tyre cover with compressed tread is a well-made article. The casing is impregnated with rubber in every fibre and moulded under great pressure. It is supplied in 26 × 2¼ and 2½ sizes only. The same firm supplies an excellent butted air tube, and a big variety of rubber goods suitable for the motor cyclist's use.

SPARKLETS



Record-breaking Sidecar.

The sidecar attached to E. B. Ware's Zenith at Brooklands on July 16th was a Middleton. It was purchased more than a year ago from Middleton's Motor Works, Stroud Green Road, Finsbury Park, N., and was an ordinary model.

A Variable Decompressor.

We hear that Messrs. G. H. Smith and Co. (London), Ltd., 12, Mortimer Street, Great Portland Street, W., have been appointed sole London distributers of the Clayton adjustable decompressor and valve cap. This is a very neat fitment, and should prove of use on early pattern motor cycles.

For Premier Riders.

The Premier Cycle Co., Ltd., organised a run for riders of Premier motor cycles on a recent Sunday from Catford to Eastbourne and back, lunch being taken at Eastbourne, the party being the firm's guests. Forty-four Premier machines turned out, and the majority of them were fitted with sidecars, some of these combinations carrying as many as four passengers. The outing proved a great success in every way.

Tyres in Irish End-to-end.

We are informed by the Hutchinson Tyre Co. that in the recent Irish End-to-end run over fifty per cent. of the finishers rode machines fitted with this make of tyre. Between them, riders of Hutchinsons secured the President's prize, team prize, C. and M.M. and T. prize, and twelve medals.

Tube Bags.

We recently illustrated in our "Accessories" columns a very useful fitment in the shape of a leather bag for carrying spare tubes. We then mentioned that this had been introduced by Messrs. Maude's Motor Mart. We are now informed by the St. Edmund Motor Co., Northampton, that the provisional patent for this device is their property, and that Messrs. Bramson, Kent and Co. are appointed wholesale distributing agents.

Catalogues Received.

The latest leaflet published by Auto-Carriers, Ferry Works, Thames Ditton, entitled "The £100 Cycle Car."

Brown Bros., Ltd., Great Eastern Street, E.C., send us a most comprehensive list of tools and accessories. The exact weight of the paper used in printing the 1913 issue was 64 tons 14 cwts.

Villiers Eng. Co., Ltd., Blakenhall, Wolverhampton (The Villiers power unit for motor cycles); The Service Co., Ltd., 292-293, High Holborn, E.C. (13th edition of "The Motor Cyclists' Buyers' Guide." This book has 102 illustrations of various accessories); The Priory Accessories Co., Priory Mill, Coventry (motor cycle accessories).

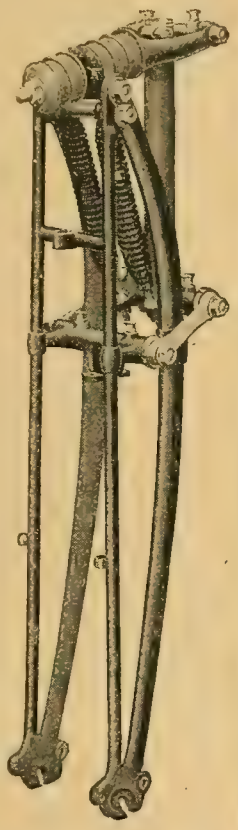
THE "BRAMPTON BI-FLEX" Spring Fork

Absorbs both vertical and horizontal shocks

Other makes absorb shocks in one direction only—generally vertically.



In the Brampton Bi-flex Fork the girder is attached to the bottom of the steering column by links, and a pair of springs absorb vertical shocks. The top of the girder is not held by links, but cushioned between two sets of rubber buffers, and moves backwards or forwards under horizontal shocks. These two movements taking place simultaneously absorb all shocks, the buffers damping out any tendency to bounce.

The bearing surfaces are large, and adjustment is provided to take up wear in the links.

This fork gives a high degree of comfort unobtainable by any other make, whilst two years of continuous testing have proved its reliability and durability.

Descriptive pamphlet free on request.

BRAMPTON BROS: LTD., Oliver St: Works, Birmingham.

If

You want to break records—if you want to win competitions, or if you would be free of all lubrication troubles when touring use

STERNOL

Elite Oil

The Ideal Motor Cycle Oil.

Sternol Elite Oil enables you to get every ounce of power from the motor by lubricating perfectly—completely: it does not gum or soot up—is economical in use and unaffected by temperature variations.

Ask for Sternol Elite and *insist* on getting it.

STERNOL (Stern-Sonneborn Oil Co., Ltd.) 56, Royal London House, Finsbury Sq., London, E.C.

"About five months ago my repairers, Messrs. Skeel, of Cambridge, fitted an Endrick Decompressor to my 1912 Bradbury, with the result that I have almost forgotten—sometimes I do forget—that the machine has such a thing as an exhaust lifter on the handle-bar. I always run with a sidecar on my round and the comfort of your Decompressor has to be known to be realised. I have started with 34 stone up at a sharp walking pace by means of your Decompressor, and am but a novice at riding."

(Signed), L. Gwillim Davies, M.D., Lavernock, Histon, Cambridge. June 19/1913.

Flexibility.

It is reported that a famous actor, on being asked to spell Shakespeare, promptly replied "R-u-i-n." To paraphrase his remark, we might assert that Flexibility spells Perfection. This is true, because the perfectly flexible engine is yet to seek, and probably so long as motor cycle engines are in the main confined to the two and one cylinder varieties, perfection is a long way off. When it is called to mind that car designers have gone to six and even eight cylinders to attain the ideal of flexibility, it will readily be seen how difficult is the task of the motor cycle engine designer to produce in his limited space a reliable, even turning motor under variations of load. It is not sufficient to produce an engine that will turn as slowly as two hundred and as high as five thousand revolutions a minute. This does not constitute flexibility, though some people appear to think it does. What is wanted is the motor that will give out ample power at widely different speeds.

The assistance of a variable change of gear goes a great way to assist a well-designed engine to attain its ideal, but even the use of a low ratio of gearing has its limitations, and then the balance of the engine and the method of its feeding with gas begins to count. Indeed, it is probably more a question of good carburation than balance to get a motor to run really slowly and at the same time propel a load, and it is very gratifying to see that the question of carburation in motor cycle engines is now receiving an amount of attention that it has until lately sadly lacked.

Recognising the need for encouragement in this direction, the A.C.U. has inaugurated a radical departure in the Six Days' Trials to be held in the North next week. This is none other than a flexibility test, pure and simple, over 250 yards of road with an upward gradient averaging 1 in 10. The machines will be expected to cover the first fifty yards at a speed not exceeding 7.2 m.p.h., and the remaining 200 yards at not less than 18 m.p.h.

At first sight these tests may not appear easy to perform on the up gradient selected, but we write with knowledge that officials of the A.C.U. have themselves passed these tests on a well-known 2¾ h.p. single machine and a single-geared 6 h.p. twin. We should like to emphasise to the full our approval of such tests, as we know they are of a nature to improve the breed of motor cycles far more than the mere letting of them to climb prodigious gradients.

British Supremacy.

IN studying the results of recent important competitions at home and abroad, one cannot fail to be struck by the undoubted supremacy of British motor cycles. In this country, with but a few exceptions, the home-made machine is universal. This also is the case with respect to most of the colonies, Canada being the exception, and the British machine is rapidly gaining popularity on the Continent. It was only natural that the British machine should predominate in the Manx Tourist Trophy Races the—"blue riband" of the motor cycling world, and, that being the case, it was to be expected that the winners of these races should be found amongst the home products. In the Senior Race, only one make of machine that was not British is found amongst those who got through, that being a machine which has been for years on the British market. In the Junior Race, one continental machine again appears in addition to the British makes.

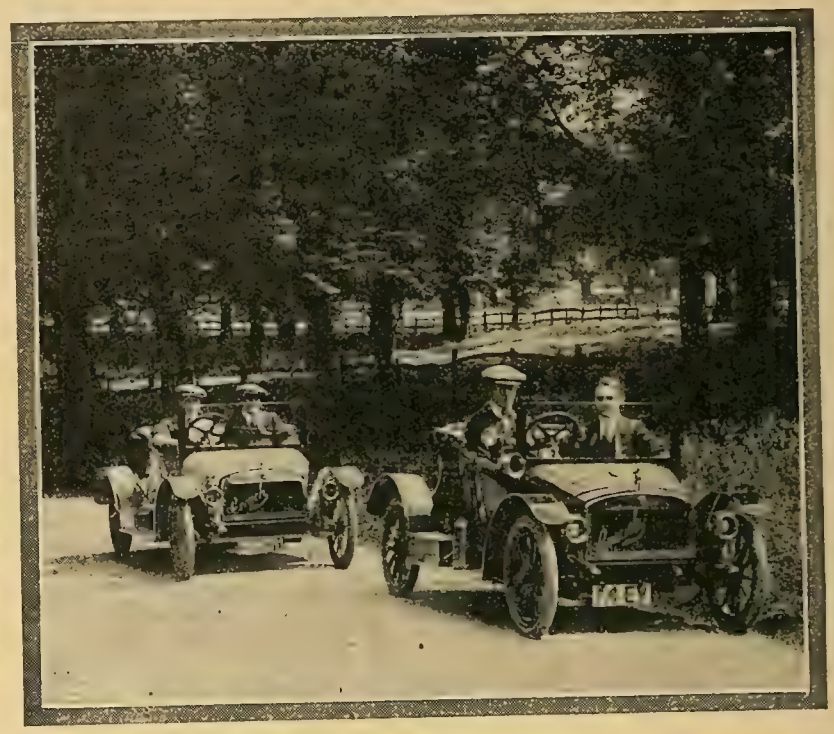
Turning now to the races which have been recently held on the Continent, it is gratifying to find that much the same state of things prevails, and we notice that not British riders only, but the continental cracks pin their faith to the English machine to a very large extent. Undoubtedly the most important of these races is the Grand Prix, recently held on the Picardie Circuit. Here, in the 500 c.c. class, British occupied the first four places, and there were in fact but three foreign machines in the first twelve. In the smaller class, 350 c.c, the English machines were not so prominent as usual, taking the fourth place only, but the first three machines were partly of British design.

More recently still, the Spanish T.T. Race, as it has been called, from Bilbao to San Sebastian and back, has furnished ample proof of British superiority, all the finishing machines in both classes with but one exception being English. The Spaniards to a man in the 500 c.c. class were upon English mounts. And last of all the English-Dutch Trial has ended in an overwhelming victory for Britain and British machines.

This, so far as it goes, is eminently satisfactory, and great credit is due to our English designers and workmen; but they must not rest on their laurels if they are to retain this position. The rear springing question will have to be gone into very carefully in the near future; lubrication must be made more certain and more effective, and should depend less upon the skill of the rider.

An Experience of a New Cycle Car.

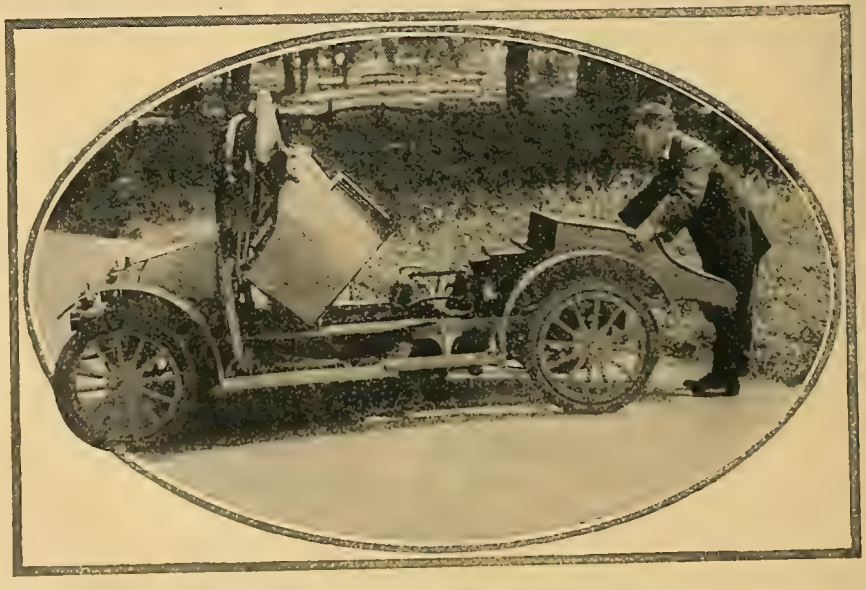
IT is some time since we had the pleasure of a run on a Crouch Carette, and Mr. J. W. F. Crouch, jun., last week, having two finished models ready for delivery to customers, kindly invited us to sample their running. Both were exceedingly smart-looking cars, fitted up complete, one finished in vermilion red and the other in French grey. The first car was built specially to the order of Mr. Taylor, of Messrs. E. S. Thomas and Co., Great Titchfield Street, London, and was named the "Pink Cat." We drove the last-mentioned car on the outward run, which was a short trip to Kenilworth, thence to Stoneleigh Hill, and what impressed us most particularly was the absence of noise, due to the engine being placed at the rear of the seats. Owner-drivers of cars with engines in front become accustomed to a certain amount of clatter from the valve tappets, but in the Crouch and G.W.K. this is strikingly absent. To those, therefore, who do not object to the seats being placed well forward to enable the engine to be disposed behind the seats, this construction possesses a decided advantage. Except for a little clutch slip, due to the newness of the cars, the two Crouches behaved themselves admirably, starting easily and pulling well on hills. Even on the lowest gear, engine vibration was noticeably absent.



Two new Crouch Carettes ready to be delivered to customers.

The comfort of the car left little to be desired, and the steering is very light indeed, giving even a stranger to a Crouch a feeling of confidence from the start. We changed driving seats on the return journey, the French grey car, which had had a week's running, proving slightly the faster and the better pulling car of the two. Among the features of the Crouch Carette is the door on either side, so that the driver may get out of the car without disturbing the passenger, and also the folding seat to render the engine, gear box, and transmission readily accessible. It is the work of a couple of minutes to open the doors and fold up the driving seats on their hinges, and then remove the tailboard and thus expose the whole of the working parts. The single chain drive provides a very smooth transmission.

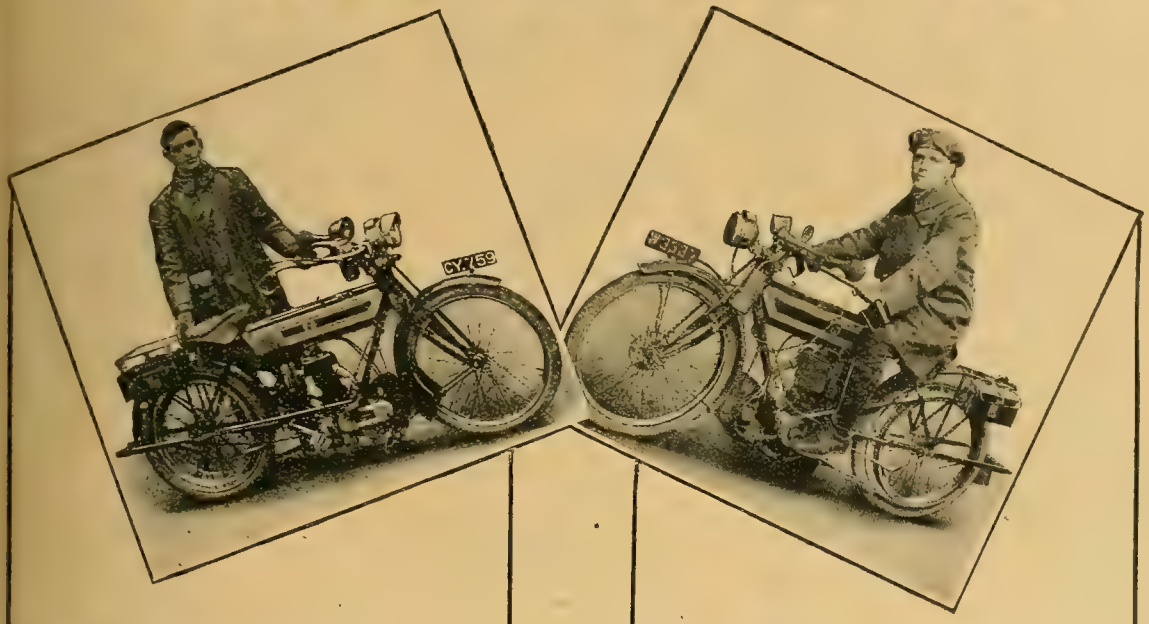
By the way, Mr. Crouch, having read our remarks on the need for differential gears for cycle cars, decided to dispense with these as an experiment, and according locked up the axle so that it ran solidly. He tells us that he found no evil effects from the use of the solid axle, in fact, it was almost impossible to detect that the differential effect on corners was absent. He is, however, of the opinion that when reversing and turning corners sharply tyre wear would be likely to be excessive, and for this reason he will continue to use differentials.



Showing the extreme accessibility of the Crouch. One minute suffices to fold up the seat and remove the rear portion, so exposing the engine, gear-box, and transmission.

Remarkable Reliability of the

TRIUMPH



Mr. T. Evans, Winner of GOLD MEDAL, in the Aberavon, Port Talbot, 230 Miles' Reliability Trial, on his 3½ Triumph.

Mr. Stephen Raynes, winner of the Sheffield to Holyhead and back, Reliability Trial for the Hutton Shield, 316 miles, on his 3½ Triumph, without loss of a single mark.

Anglo-Dutch Trial.

W. F. Newsome, 3½ Triumph .. .. .. GOLD MEDAL.
R. G. Mundy, 3½ Triumph .. .. SILVER MEDAL.

OCCASIONAL COMMENTS

BY "IXION"

The Variable Jet Carburetter.

I feel considerable sympathy with the contents of "Autobore's" eulogistic letter anent the variable jet two-lever carburetter, as opposed to the genuine automatic type. He must plainly understand that the welfare of the industry depends upon the 99% of motor cyclists who are duffers, rather than upon the 1% who are engineers and driving experts. I have ridden thousands of miles with such a carburetter as he describes, and, ranking myself as a driver of some skill and experience, I prefer it to most types. Here is the reason why I took my last sample of this type off my machine: I was driving a different carburetter every week, often on different engines, and I found that the "mixture"—to revive a term of much meaning in the era of the surface carburetter—was excessively tricky. It varied not a little with the diverse jet adventures—perhaps more so then than with the 1913 model, which I have not had time to test. In my work of reporting trials as a journalist, or of competing in them in my private capacity on occasions, I found it a great nuisance to be uncertain as to where my air lever should be set for any given emergency, and so off came the variable jet two-lever in favour of a fixed jet two-lever, which was fractionally more efficient than any genuine automatic which I have tried. All this applies *a fortiori* to the raw novice, for whom the first machine at any rate cannot possibly be too simple. But I find that, except when I am in the mood for trying to do something difficult rather well, I prefer the automatic type for my own riding. At this present moment I am snatching a brief vacation at a very crowded and hilly holiday resort. I brought two carburetters with me, a fixed jet two-lever and an automatic. *Rubesco referens*—if you like; but I find that for lazily dodging the inebriated tripper, and the nut, who peers into the face of his flapper, the world forgetting and by the world forgot, I infinitely prefer the single lever type.

Engine "Revving" and Bearing Wear.

I am quite as discontented as "H.U." (page 958 in the issue of July 24th) with our present system of engine lubrication; but I think he is guilty of gross exaggeration when he insinuates that the average engine requires new big end and gudgeon pin bearings after so short a distance as 2,000 miles. A year or two ago, I found an engine of well-known make which certainly wanted a new big end bearing after every 2,000 miles spell, but it was a new engine, and it was the design of the bearing, rather than the system of lubrication, which made such early replacements advisable. I should say that, even in clumsy hands, the high-class modern engine is capable of doing a good 6,000 miles before the big end bearing gets noticeably sloppy. His insinuation, added to certain other complaints of a similar nature, led me to seek out two novice owners in my vicinity who bought leading 3½ h.p. machines early in 1912 and are still running them after mileages of about 11,000 and 13,000 miles respectively. We took these engines down completely, and in neither case was a new big end urgently necessary. In one case, the gudgeon pin bush was perfect; in the other, by a curious factor of which I am ignorant, the oilways had acted as a matrix, and had engraved themselves on the opposing surfaces. I confess that I cannot understand all this talk of worn gudgeon pin bushes, for my own ex-

MEMBERS OF THE ENGLISH TEAM CLIMBING KOP HILL.

W. F. Newsome (3½ h.p. Triumph with Philipson pulley) about to pass a Dutch rider.

Occasional Comments.—

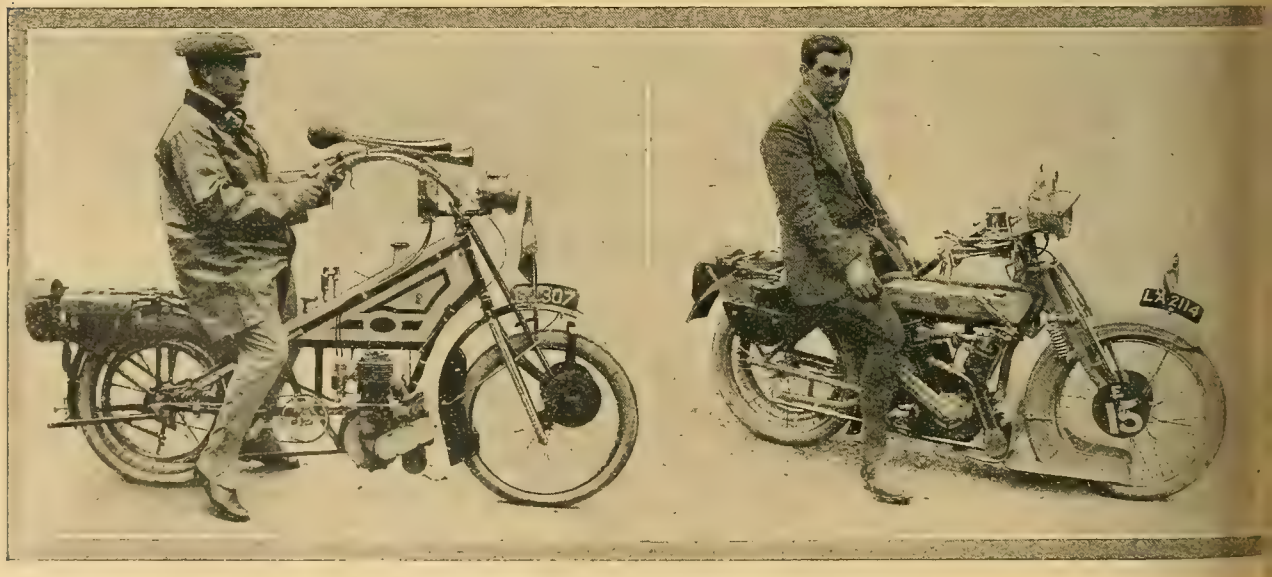
perience is that the little end is the last part of an engine to show appreciable wear. Some years ago I bought a light 5 h.p. twin for a novice friend, and within 100 miles of taking it over, he seized it so badly that the looped ends of the connecting rods, into which the big end bushes are driven, had pulled out oval, and the bushes themselves were recovered in the form of powder from the crank case; yet the gudgeon pin bushes were in such good order that we replaced them *in situ* when we repaired the engine. I should estimate, therefore, that the average life of a big end bearing is well over 6,000 miles, and that the little end bush is good for two seasons at least. In spite of this, I am, of course, an enthusiast for the W.D. or other sound system of forced lubrication. Has not my next door neighbour an inexpensive car which has done five years' hard work without asking for any of its engine bushes to be attended to at all? This may be due to a variety of causes, but certainly one of these causes is the more satisfactory system of lubrication which obtains on cars.

Tyre Holes Under Patches.

Trying for once to assume a purely judicial and dispassionate attitude, notoriously a difficult matter for us Irishmen, I must confess that my correspondents have made out an excellent plea for a verdict of guilty. There appears to be little room for doubt that holes do gape and split and widen under patches in prolonged wear, until a further air leak is set up as the hole extends towards the edge of the patch. We commit the future to the tyre makers and menders—they must try to make this impossible, if they can. In the meantime, we must take temporary measures in two directions: first, we must try to make our patches adhere evenly throughout their entire contact area; we must solution every square millimetre of that portion of the wounded tube which comes under the patch, and we must use one of the handy little spring presses now sold for holding patches in position while they are drying out; if such a press is employed, great care must be taken to prevent any surplus solution from trickling through into the interior of the tube. Secondly, we must study the best ways of removing an old patch, under which a puncture hole has split and extended. Benzole is not recommended; petrol is good; benzoline is apparently better: but above all a little judicious application of heat is very helpful. The heat may be obtained from the iron of the guidwife in the nearest cottage, but is usually to be obtained from the finless waist of the cylinder barrel. There we must leave the matter for the moment. It is a weakness of little moment to men who do not run their tubes to destruction, for my enquiries have not revealed a single instance of a hole splitting to overlap a patch within three months of its application thereto.

The Best Carrier Straps.

From the littered condition of highroads at holiday times, and from various lists and advertisements of articles lost or found, it is obvious that many motor cyclists do not know how to attach luggage to a carrier in a secure fashion. In my time I have lost nearly every imaginable part of my machine, excluding the engine, but at last I have learnt how to tour in comfort without continually twisting my wrist behind me to discover if my kit is still safely aboard. I have utterly abandoned the long narrow straps sold by most dealers and used by most riders, and I have adopted what is practically a leather belt as a carrier strap. I use two, or even three, long, broad, flat straps usually as much as 3in. wide, and only thin enough to enable them to pass between the tops of the pannier toolbags and the tubular sidebars of the carrier. I own a proper punch, with which I stamp clean round holes along the whole length of the belt or strap: if this is not done at the outset, a knife is sure to be used, sooner or later, and with disastrous results. Two of these belt-straps will grip a small handbag and a suit of oilies as in a vice.



EXAMPLES OF ENGLISH AND DUTCH MOTOR CYCLES.

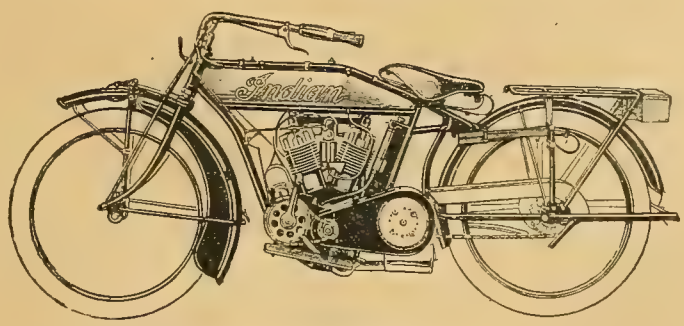
J. M. Bergmans, 4 h.p. Simplex the huge handle-bars of which are a feature.

R. G. Charlesworth, who successfully rode a new pattern Zenith with 6 h.p. M.A.G. engine.

There is no mistaking the power of the Silent Red

Indian

it is where it should be—right in the engine. Riders of Indian motor cycles have that confidence which comes from possessing a machine of absolute dependability. Indian credentials are not mythical, but consist of brilliant performances and the annexing of innumerable records the world over. Investigate the Indian.



Indian machines comprise 3½ h.p. Single and 7 h.p. Twin models. Both are fitted with the well-known chain transmission.

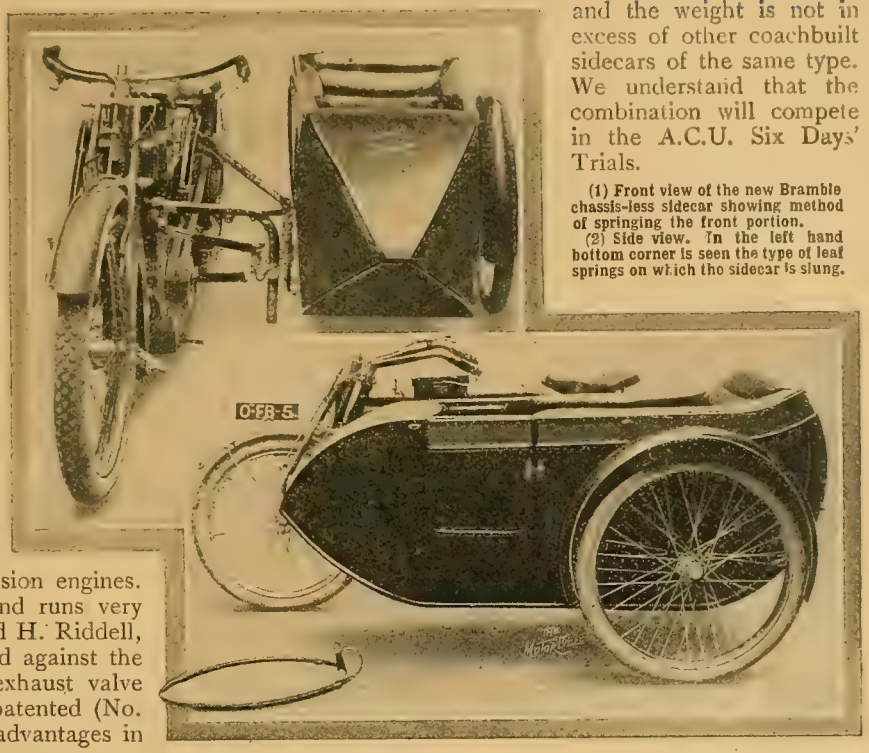
A NOVEL SIDECAR.

WE recently had a short but pleasant run in one of the latest Bramble sidecars. This has practically no chassis in the usual acceptation of the term, the necessary channel steel frame being entirely hidden by the sidecar body. This frame is underslung, in the rear by springs such as that shown separately in the lower photograph, and in the front by two small spiral springs. Four-point suspension is employed. The sidecar is well upholstered and comfortable, it has a roomy box below the seat, and the combination steers very well, it being possible to drive without touching the handles. The machine to which the sidecar was attached consisted of a Matchless frame to which was fitted one of the latest 8 h.p. Precision engines. This engine is distinctly powerful and runs very cool; after some miles at a fair speed H. Riddell, the driver, was able to hold his hand against the cylinder without discomfort. The exhaust valve lifter is very neat. The sidecar is patented (No. 4,357, 1913), and possesses many advantages in the way of easy cleaning and neat appearance, and the weight is not in excess of other coachbuilt sidecars of the same type. We understand that the combination will compete in the A.C.U. Six Days' Trials.



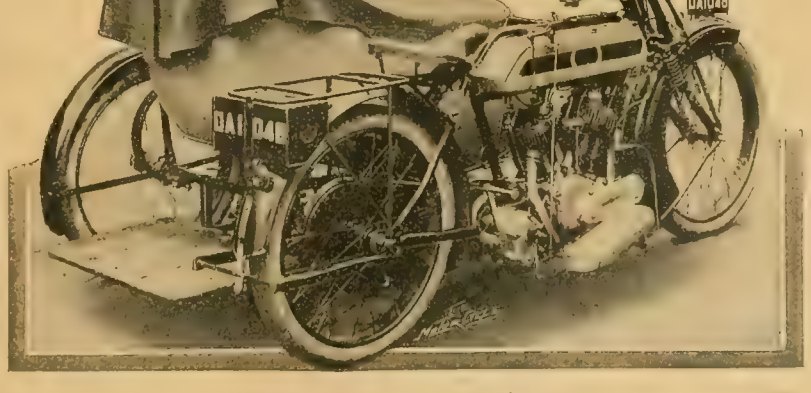
(1) Front view of the new Bramble chassis-less sidecar showing method of springing the front portion. (2) Side view. In the left hand bottom corner is seen the type of leaf springs on which the sidecar is slung.

2,000 Miles on an A.J.S. Sidecar.

IT was early in March last when we took delivery of a 6 h.p. A.J.S. and Millford sidecar, and having ridden this combination over 2,000 miles we are in a position to give our experiences regarding its behaviour. Few motor cyclists are unfamiliar with the A.J.S. twin engine, and its three-speed gear box and method of transmission, as details of these features have been published in *The Motor Cycle* on more than one occasion. The machine we ordered was a standard one in all particulars except tyres, the latter being 650 × 65 mm. Roms, the sidecar having a 26in. × 2½in. Continental. The day we fetched the combination from the works at Wolverhampton was about as bad a day as it was possible to have for motor cycling. Alternate frost and thaw had loosened the road surface, and it rained nearly all the way home, so we were therefore quick to recognise the advantages of enclosed chain transmission, and the efficient mudguarding which kept the engine, magneto, gear box, and all vital parts practically dry and free from mud.

Little Attention Needed.

The mileage accomplished up-to-date comprises undulating Midland roads, the Cotswold hills, the loose and gritty surfaces of Hampshire and the New Forest, a four along the South Coast from Bournemouth as far as Plymouth, and from Plymouth to North Devon over Dartmoor. When we say that beyond adjusting the chains and front wheel bearing we have done absolutely nothing to the machine, and nothing to the engine except grinding the exhaust valves, readers will possibly conjecture that we must be somewhat careless, but there has been nothing in the way of mechanical troubles so far, and we do not think any motor vehicle could possibly be more reliable.



A standard 6 h.p. A.J.S. three-speed sidecar outfit.

2,000 Miles on an A.J.S. Sidecar.—

The sidecar seat is of cane, and fitted on one of the 1913 Millford Cabrio dropped chassis; it is beautifully sprung, and the passenger considers it far more comfortable to ride in than the rear seat of the average small car which she has tried.

The advantages of the A.J.S. twin are a smooth running, quiet engine which never overheats, a three-speed gear which changes readily and without noise or jar, its lowest ratio being capable of taking the combination with driver and passenger and a reasonable amount of luggage up any hill—in fact, it will do this with the second speed in use on all but the severest hills in the country. The clutch acts sweetly, and being hand-controlled can be manipulated with great delicacy; the brakes are adequate for any hill, and, with one or two exceptions in Devon, the powerful rear hub brake, which is internal expanding metal-to-metal like a car brake, is more than sufficient to hold the weight of the combination when required.

The R.O.M. 650 × 65 mm. tyres fitted to the motor cycle and the 26in. × 2½in. Continental on the sidecar wheel have given admirable results in the two thousand miles they have covered.

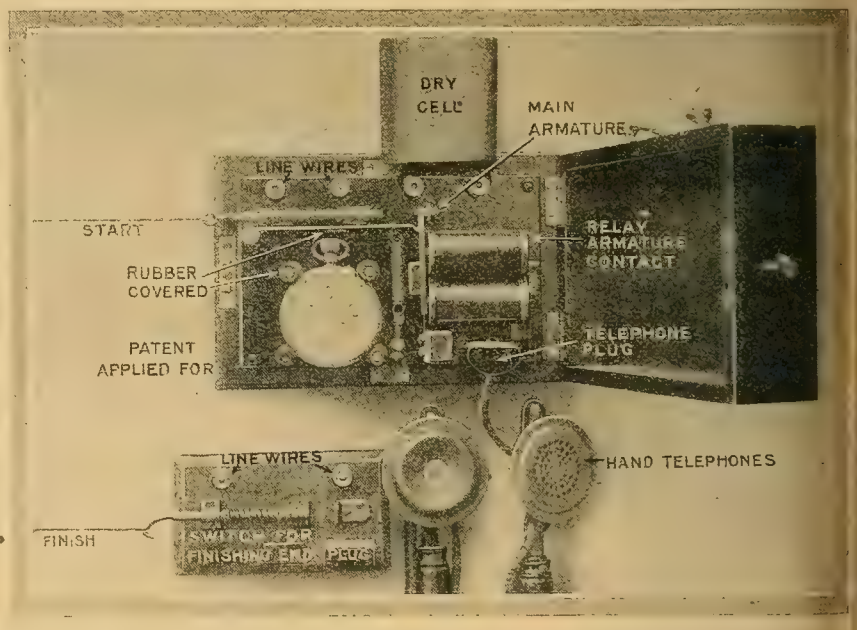
A Mechanical and Electrical Timing Device.

As the intricacies and cost (not to mention the failure at a critical moment) of electrical timing for hill-climbs and speed competitions seem to have been abandoned in favour of flag timing or the telephone method—in both of which the "personal equation" is bound to enter—absolute accuracy being impossible, the following description of a simple, certain, and "fool-proof" method may be of interest.

Referring to the photograph, it will be seen that when the thread stretched across the road, attached to the spring bar marked "Start," is broken (the watch, etc., are fixed at the starting end of the course), the bar, in springing back, impinges on the armature of the electro-magnet, releasing the spring bar over the watch, thus starting it. (So far no current is used.) All the operator has to do is simply to lift the bar back on to the catch on the armature. At the finishing ends, the thread is also stretched across the road (or contact strips may be laid on the road), holding back a spring bar or switch, which simply makes the circuit on being released. A weak current flows along the line (owing to its resistance) just sufficient to move the very light armature shown in the photograph (though not very distinctly) on the right-hand end of the electro-magnet (which acts as its own relay). This cuts out the whole of the live wire, directing the current in full round the magnet, which pulls the main armature, releasing the flat bar and stopping the watch. The watch is held in rubber-covered buffers, and the flat bar also has a piece of rubber attached where it comes in contact with the watch, to prevent any jar or injury to it. In falling, this bar breaks the circuit, so that the only current used is for the very small fraction of a second taken in moving the main armature.

At both the watch end and finishing switch two plug holes are suitably connected, into which it is merely necessary to insert the plug of each hand telephone, speech being quite easy and distinct with ordinary metaphone instruments over a kilometre (the only distance the writer has been able to try it, though he has not the slightest doubt it would be quite as good over a mile course).

The current used is very small, one of the dry cells used in hand flash-lamps, and sold at 5d. each, being sufficient to work the whole apparatus for a dozen competitions; and there are no switches to be put on or off (and probably forgotten at the wrong moment). On a two-line cable (18 S.W.G.) the telephone cannot be used while the machine is running between the two points, but as soon as the motor has passed the finish the plugs are inserted for speech. On a three-line cable the telephone could, of course, be used quite independently of the watch apparatus, using one line common to both circuits.



Simple and inexpensive, mechanical and electric timing device, suitable for use in hill-climbs and speed tests.

The size of the whole affair can be judged in comparison with the watch. Including the mahogany lock-up case, the outside measurements are 7 × 4¾ × 2 inches over all, and the weight, including telephones, watch, cell, and finishing switch (everything excepting live wire), is under 6 lbs. When the live wire is laid it is only necessary to attach the two ends to their respective terminals at each end, put the cell in position, wind up the watch, and, beyond lifting up the bar after the start, the instrument does the rest

Road shocks and—YOU.

After all, the road shock and your touring pleasure never quite agree.

There is nothing more responsible for the fatigue that spoils that pleasure than the road's irregularities, and nothing that will more successfully nullify that baneful influence than a saddle scientifically constructed.

A saddle which will spring without bouncing, be entirely free from roll or side-swing and form a steady stable seat at all speeds and under all conditions.

Such is the

BROOKS B 220—

the most successful "go-between" between "Road shocks and—you."

B220—the ideal high-speed touring Saddle, giving an exceptionally low-riding position; seat is suspended on a patented form of laminated springs which, while allowing free movement in a vertical direction, and absorbing all shocks arising from an indifferent road surface, eradicated all tendency to roll, bounce, or side-swing. Price 30/-

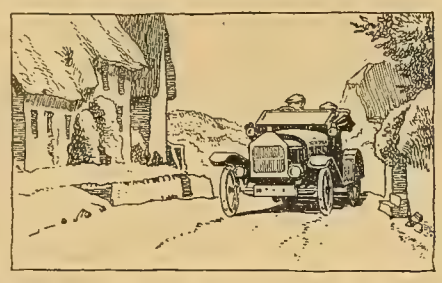
(5) R. G. Mundy (Triumph) and D. H. Noble (Rover) climbing Kop Hill side by side. (6) J. L. Geidt on the 6 h.p. Cyclonette, which is a thoroughly reliable machine, and attracted much interest throughout the trial.



Dispensing with the Differential Gear.

By ERIC W. WALFORD.

THE designer of the cycle car who endeavours to produce a satisfactory vehicle within the £100 limit is at present almost bound to avoid the conventional motor car live axle construction, and for the most part one of two alternatives is adopted. In the one case one wheel alone is driven, whilst in the other the axle transmits its torque to both road wheels through over-running clutches.

There is, however, a third construction which is, perhaps, more satisfactory, which is simply to dispense with the differential and drive through both wheels, but none of these arrangements are, of course, novel, having been employed in the early days of motor cars.

There are many arguments for and against dispensing with the differential gear, but the most potent is probably the saving of cost. It seems strange, however, that differential gears cannot be purchased on the open market in this country in the same way as they can in America. In that country there are large manufacturing concerns who specialise in particular parts of a motor car, such as the universal joints and the differential gear, with the consequence that a sound differential can be bought at a very low figure, and it would seem that if a manufacturing firm laid itself out to produce inexpensive differential gears this could be done at a very low cost.

A Notable Case.

On the Sunbeam Grand Prix racing cars for 1913 the differential gear was dispensed with altogether, the road wheels being bolted directly to a single live axle shaft. The conditions to which this car was exposed were not, however, quite the same as with a cycle car. A racing car is driven at a high speed, and when taking a corner it heels outwards considerably, and there is but little weight on the inside wheels, with the consequence that the inner back wheel is free to slip without doing much damage to itself. The main object of dispensing with the differential gear in this case was to reduce as much as possible the unsprung weight, and also to prevent loss of power due to the wheels spinning freely in the air. In the ordinary case when one wheel leaves the ground it is, owing to the presence of the differential gear, free to spin at a higher velocity than the wheel on the ground. When it comes down on to the ground again, not only is power lost but the tyre also skids considerably.

From the short experience of these racing cars up to date, tyre wear does not seem to be greater than ordinarily obtains, but doubtless such an arrangement would not be suitable for, say, a taxicab. Immediately after the Grand Prix Race I asked Mr. Coatalen his experience of the type of back axle which he used, and he informed me that it was very satisfactory, and that he found the car would hold the road better than if a differential were fitted. While driving, the absence of the differential could not be detected. Dispensing with a differential gear in this way also possesses certain advantages with regard to braking and side-slip.

The Advantages of Single Wheel Drive.

In cases where a single road wheel only is driven, there is an advantage that such a vehicle is very little liable to side-slip. It is well-known now, and was originally pointed out by the Editor of *The Autocar* in March, 1906, that if one wheel at each end of the car is allowed to run free, *i.e.*, is neither driven nor braked, the car will not easily side-slip. It is for this reason that a motor bicycle with sidecar is so stable, and I am informed by a cycle car manufacturer that this theory is borne out in the machines of his make in which a single back wheel provides the propulsion.

When the road wheels are fitted on over-running clutches the brakes must, of course, be arranged on the wheels themselves, and if provision for reversing is made, the over-running clutch system must be more or less complicated, so it is debatable whether the cost of production is reduced. Again, with this arrangement the engine cannot be started by letting in the clutch when the vehicle is moving.

Automatic Clutch Gear.

In the third alternative each road wheel is driven from the shaft through a friction clutch, and the clutch forks are so connected with the steering that when turning to the right, say, the right hand clutch is withdrawn, propulsion being always by the outside wheel. This overcomes the chief objection to the single wheel drive, namely, that when turning a corner with the driving wheel on the inside the gear ratio is greatly increased. For instance, with a cycle car of this type climbing Sunrising Hill it might be that the gradient in itself is well within the scope of the car's ability, but the right hand turn will so raise the gear ratio that the machine will fail if it was at that time driving through the right hand wheel. Of course, it is only on a sharp bend that this effect is of much importance, but it is on many of the steepest hills that the sharpest of bends are to be found.

There is, of course, another alternative in which the rear wheels are driven by separate belts through a counter-shaft, no differential being used, the supposition being that the belts slip, and possibly this is a very good construction, as it would seem to give the advantages of the differential-less arrangement without the disadvantages of a single wheel drive.

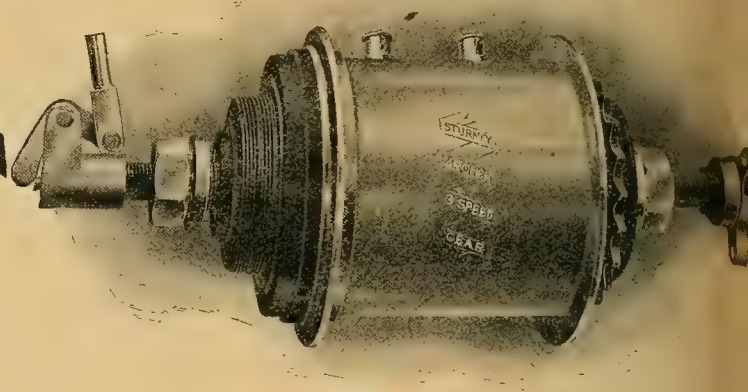
Scottish 6 Days' Trial.



Sensational Performance by Mr. Hugh Gibson

on 3½ Bradbury-Sidecar with

STURMEY-ARCHER
3-SPEED GEAR.

Mr. Hugh Gibson writes us: "I have succeeded in climbing every hill on the course (all observed)—gaining full marks and gold medal.

Applecross, Amulree, Spittal of Glenshee, Berriedale, Glendoe, etc., etc. All these giant hills were conquered by the aid of the Sturmey-Archer Gear, and you could have no finer advertisement of the reliability of the gear."

Speaking of Mr. Gibson's ascent of Applecross, "Motor Cycling" says: "Before the performance most of the competitors would have said that it was an impossibility for it to be accomplished."

New booklet post free from—

STURMEY-ARCHER GEARS, LTD., NOTTINGHAM.

STAR IMPROVEMENTS.

THE Star Engineering Co., Ltd., Wolverhampton, have made several important improvements to the 4 h.p. Star, which is a single-cylinder chain-driven model with three-speed counter-shaft gear suitable for sidecar touring.

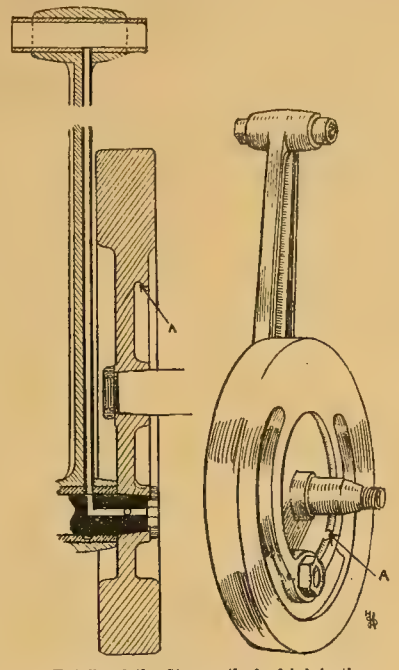
The original gear-changing levers have been discarded, and are now replaced by a quadrant and lever on car lines, the former being attached to the bottom rail under the tank. The lever terminates in a round knob, and is fitted

The Star silencer, showing internal arrangement.

with a spring catch. The *tout ensemble* is neat and workmanlike. The cone leather-covered clutch on the engine-shaft is pedal operated, the levers have been made neater, and the pedal placed in a more convenient position.

A Clean Crank Case.

A slipping clutch is provided on the counter shaft chain wheel. A fibre disc forms the slipping medium, and is held by a strong coil spring between two steel plates. This is intended to absorb any sudden shock which might, owing to careless driving, have a tendency to break the chains. The right half of the crank case, timing gear box, and magneto chain case are all formed in one casting, thus preventing any possibility of oil leakage. The opening for inserting the magneto chain is on the top of the case, and at this point there is a cover and joint, but this and the timing gear box cover are the only places where oil could possibly exude; the result is a clean crank case. A decompressor has been added. This is entirely enclosed in the timing gear box, and is operated from the handlebar by a lever, which, on being moved to its fullest extent, operates an exhaust valve lifter mechanism, which is combined with the decompressor. Large coil springs are fitted under the footboards, which are hinged in front.



Details of the Star method of lubrication. Left flywheel and connecting rod. Right section of flywheel and rod showing oil path. A.A., oil trough.

The silencer has been enlarged, and now consists of one long expansion chamber divided by a circular partition into two compartments. The exhaust pipe runs through the centre, and is stopped midway. Holes drilled in the first half of the pipe allow the gases to expand into the first compartment, thence they flow into the second compartment through holes in the partition, and again expand, entering the final exhaust pipe through another series of holes.

The subject of lubrication is a vexed one, but the Star Cycle Co. claim to have solved all oiling troubles with their system, which functions by centrifugal force.

Centrifugal Lubrication.

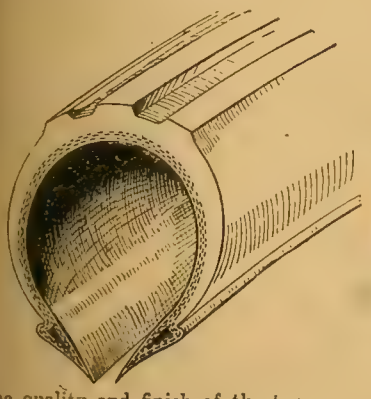
On the tank is a sight drip feed, and the oil flows from this to the timing gear case. On the side of the flywheel next to the timing case is cast a trough, which extends right round except at the boss for the crank pin. The oil is led from the timing case by holes, so that it falls into the trough, and when the engine is running centrifugal force drives the oil from the trough along holes which communicate with the crank pin bearing. From this point it is conveyed up a copper pipe secured to the recessed side of the connecting rod and to the gudgeon pin bearing. The gudgeon pin is hollow, and after the oil has lubricated this bearing it is driven along the hollow pin to each side of the piston, where it lubricates the cylinder wall and falls into the crank case.

Mr. Bradford, of the Star Co., informed us that this lubricating system has given entire satisfaction, and we had ocular proof that the oil so circulated reaches every part of the engine.

AMONG THE ACCESSORIES.

A Substantial Cover.

What appears to be a substantial cover is one sent us for inspection by Messrs. Armstrong and Co., 24, Goldhawk Road, Shepherd's Bush, London, W. It is known as the 26×2½in. Armour Grade 1 heavy three-ribbed cover, and

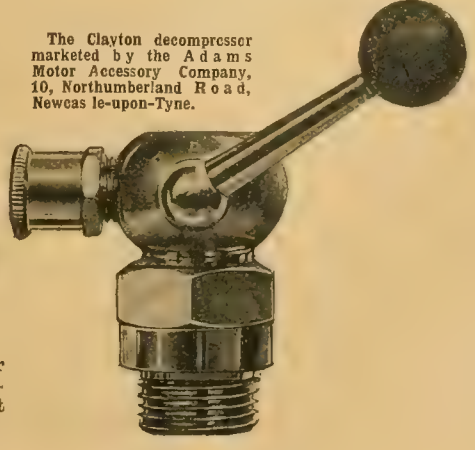


the quality and finish of the tyre appear to be excellent. Readers having powerful machines would do well to inspect this make of tyre.

The Clayton Decompressor.

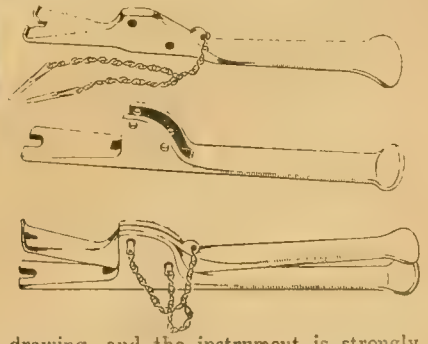
This decompressor is in the form of a two-way tap fitted with a non-return ball valve. The ball is kept in position by a spring, the tension of which can be varied so as to obtain any desired variation of compression of the cylinder. The operating lever has three positions, the first making the decompressor serve the purpose of an ordinary compression tap, the second bringing the decompressor into operation, and the third being the off position. The article appears to be well made, and is well finished.

The Clayton decompressor marketed by the Adams Motor Accessory Company, 10, Northumberland Road, Newcastle-upon-Tyne.

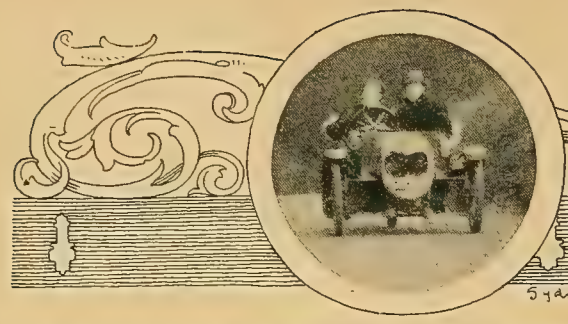


A Useful Implement.

We illustrate a neat tool which combines the offices of a valve lifter and tyre lever. Its action is clearly shown by our



drawing, and the instrument is strongly made and well finished. Its price is 2s. 6d. black or 3s. 6d. nickel-plated, and it may be obtained from the Service Co., Ltd., 292, High Holborn, W.C.



BENZOL AND HOW TO USE IT.

THE following are extracts from an interesting booklet issued by the Petrol Substitutes Joint Committee, which can be obtained by motorists on application to the secretary, Mr. Stenson Cooke, Fanum House, Whitcomb Street, London:

Benzol is a colourless, volatile, and highly inflammable liquid of the hydro-carbon series. In appearance it is very similar to petrol, but chemically there is considerable difference, and it can be divided into various series, *e.g.*, paraffin, olefines, and benzines. Speaking generally, the majority of benzoles are mixtures of the three series mentioned in varying proportions, and they are obtained either by extraction from coal gas, or recovered from the distillation of tar.

It is essential that good quality spirit only should be used. An unwashed or insufficiently washed spirit cannot prove successful. If in appearance the spirit is of water-white colour it is probably of good quality. A yellowish appearance argues caution, although under certain circumstances it may be quite suitable. The only safe way to prove whether a spirit be suitable or unsuitable is by means of a chemical test which indicates the extent of the presence of coumarine.

Coumarine is a dark, sticky, oily-looking substance, which, if present in the spirit, deposits itself on the valve stems near the heads, trickles down into the guides, and after a time "gums up" the valves, prevents their prompt return to their seats under spring pressure, and so renders the engine inefficient.

How to Use Benzol.

With the majority of carburetters benzol may be used equally as well as petrol. When first using it, do not alter the carburetter. After about a twenty mile run, notice if there is any sign of extra heating about the engine generally, or if the exhaust gases are extra hot. If extra heat is observed, adjustment of the carburetter is needed. In carrying out any adjustment of this nature, although somewhat paradoxical, it is a practical truism that benzol gives better results on the less-benzol-to-the-same-air idea than it does on the same amount of spirit with more air. This is an argument, therefore, for reduction of jet orifice.

After a run of about fifty miles, remove, say, a plug in one of the front cylinders and a valve cap in one of the rear ones. If there is anything in the nature of a sooty deposit, reduce the size of jet orifice. At the end of the next 100 miles do the same, and so on until such time as the right proportion has been obtained and the car runs without any deposit of soot at all. These successive jet reductions should be very slight.

As benzol is a stronger solvent than petrol, temporary troubles may be caused by paint (from the inside of the tank), small pieces of rubber, etc., which were innocuous in petrol being carried into the jet by benzol. If such troubles should occur, fill the tank with benzol overnight, and empty it in the morning, through a strainer. Particular care should be taken not to spill benzol on the coach work of cars, as it may attack the paint or varnish.

No Engine Knocking and its Lesson.

Another feature is that the use of benzol will stop knocking in practically all cases where engines are inclined to knock on petrol. The motorist, therefore, must bear this fact in mind and not "hang on" unduly to the top gear on hills just because he notices that the engine does not knock, otherwise excessive strain is being put upon the bearings, gudgeon pins, etc.

The prevalent idea that an extra air valve is needed with benzol is not correct. With the older type of carburetter, an extra air inlet may prove advantageous, but it is preferable to go on the lines of jet reduction with the same air inlet than to try to use the same quantity of spirit with additional air.

In addition to reducing the size of jet orifice, it is also desirable to raise the level of the spirit in the jet in order that it will flow more easily, thereby facilitating efficient carburation. This can be done in a number of ways, one of the simplest being to add to the weight of the float by placing a washer on top.

More Power and Mileage.

From 12% to 15% more power is obtainable when using benzol, and an increase of something in the nature of 20% more mileage per gallon. This latter fact should be borne in mind in regard to the question of price. Really good benzol commands a fairly good price at present, and undoubtedly there are a large number of benzoles obtainable at the moment on the open market which are superior to petrol. If, after trying benzol and attending to the points enumerated in these notes, the motorist does not get good results, then it is time to put a query through to some authority on the subject and try and find out the reason.

LOST AND FOUND.

We receive many letters regarding accessories, etc., both "Lost" and "Found," which we are unable to find space for. As these particular matters are of interest to two persons only, viz., the finder and the loser, we keep a list of such articles, and, should we receive a letter from the finder which corresponds to the article lost, the two persons are put into communication.

Make Pal-a-tine a "Pal-o'-tine"

You can rely upon Palatine Tyres as you would upon a "pal." They are specially made to relieve the motorcyclist of all anxieties of tyre troubles. Punctures, cuts, skids, or bursts are no longer to be feared when "Palatines" are fitted. In every respect—strength, durability, resilience, mileage and speed—they are perfect. Alone amongst motorcycle tyres they have received the A.C.U. Reliability Certificate. This is the hall-mark of excellence. And "Palatines" cost no more than ordinary tyres.

20, Gorse Road, Blackpool, July 29th/13.

Dear Sir,

I have much pleasure in informing you that I was successful in winning the Cup for the best performance with a sidecar combination in the Annual Reliability Trial of the Blackpool and Fylde M.C.C. held on Sunday, July 27th. My machine, a 3½ h.p. Bradbury with sidecar, was shod with 26x2⅜ Palatine Tyres, and on examining these I find them in splendid condition without a cut in either front or back and the pattern still showing, although they have covered 1,600 miles in all; entirely with the sidecar, and including the Liverpool—Edinburgh run. They are still unpunctured, and since fitting I have never had occasion to use my pump, and during the whole of the distance they have not caused me a moment's anxiety or trouble.

I am, yours truly,

JOSHUA J. DAY.

BI2 *In answering this advertisement it is desirable to mention "The Motor Cycle."*

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Military Motor Cyclists.

Sir,—I should be much obliged if you would allow me to inform any motor-cyclist desirous of enlisting in the Special Reserve or in the Territorial Force that he can obtain full information as to the term of service by applying to me. I would point out that a motor cyclist enlisting as such into the Special Reserve is granted the rank of corporal in the Royal Engineers, and becomes a member of the sergeants' mess from the first day of joining. The annual training is performed with the regular unit to which the man is attached and lasts for fifteen days.

R. C. APLEBIE (Capt. R.A.).

Sefton Barracks, Upper Warwick Street, Liverpool.

Lubrication.

Sir,—I see you are asking for opinions of users of Conaught motor cycles on their ingenious lubricating system, so aving ridden one 2,000 miles this summer, will give you iine.

The system works perfectly well I find, its only drawback eing that it is rather messy. The oil and petrol find their ray through the filler cap, and the oil gradually collects on he tank and must be wiped off from time to time. Similarly, he exterior of the carburetter gets covered with oil and dust, hough I do not find the interior needs cleaning out at all ften.

With regard to "Ixion's" notes on the subject, I should ot expect this system to work in the ordinary four-stroke ngine at all, as surely most of the oil which entered the ombustion chamber would be burnt and cause smoking. In he two-stroke I take it most of the oil-fog is condensed on he bearings and in the crank case during the compression n the latter, and only the petrol vapour flows through the ransfer port into the cylinder. J. H. C. BIGGS.

The Scottish Six Days' Trials.

Sir,—You will, we are sure, allow us to correct a slight rror in your excellent account of the Six Days' Trials. The ishap which caused the retirement of Mr. H. F. S. Morgan, ot 100 miles from the finish (up to which point he had lost o marks), was due to a faulty cone which split in the front ub, not to the steering gear, which at the end of the run as in perfect condition. We have learnt that for such evere tests cup and cone bearings are too uncertain.

MORGAN MOTOR CO.

Sir,—Your report of this event is very interesting and ontains perhaps as much information as one could reasonbly expect, having regard to the circumstances under hich it was written, and it is indeed doubtful whether ore useful particulars could be given unless an analysis ould be prepared of each individual competitor's perormance.

In the absence of such analysis the trials are not much uide to a purchaser and, indeed, may mislead him. Take he cycle cars. Three G.W.K. machines were entered and wo were awarded gold medals, one gaining a special award, o other cycle cars gaining any award.

There were two Morgans, a Singer, a Harding and ummers, and a Humberette entered, about which little is aid, and one might suppose the G.W.K. is the best cycle ar on the market, but on investigation one finds that on he very last day the Humberette was run into and put ut of action, and the time spent in repairing the damage as fatal to this car obtaining a gold medal. The official esults do not take cognisance of misfortunes which are not the fault either of the machines or, as appears in the case of the Humberette, the driver, and do not therefore afford any clear indication which is the best of the cycle cars; nor is there any indication that the cycle cars which competed were in the condition which an ordinary tourist would use. The G.W.K.s and Humberette struck me as coming within this description, but some of the other cars were certainly not.

From the sidecars it is even more difficult to select the best. The Bradbury is the only 3½ h.p. to gain a gold medal, but we are told, and I can well believe, that the driver "stands in a class by himself," but there must be many who would like to know what a 3½ h.p. machine with a sidecar can do in ordinary hands.

As to solo machines, those which gained gold medals vary in horse-power from 2¾ to 9, and are of various makes, from which it may be assumed that any machines by the best known makers are reliable for a test of this kind. As a capital way to spend a holiday and a test for a new make of machine and some kind of advertisement for all, these trials are excellent, and it would be a pity if they were to cease, but there are so many causes of success or failure not connected with the machine itself—as the personality of the rider, his skill in driving and in executing repairs, and unavoidable misfortunes of punctures, accidents, and so forth—that at present it is difficult to ascertain what would be the result if these causes could be eliminated. CHARLES D. WRIGHT.

Belfast v. Dublin.

Sir,—I have read Mr. R. G. Lindsay's letter published in your issue of the 17th ult., and as the official responsible for the working of this competition, I would ask you to publish the true facts of the case in your next issue.

At a conference of the Motor Cycle Union of Ireland, representing all centres, held at Dundalk some months ago, it was agreed that the inter-city contest should be run this year under the auspices of the Dublin and District Motor Cycle Club, as the starting point was within their district. Each side had ample notice of the date fixed, and over ten days before the event I wrote to the secretary of the Ulster Centre to forward me the names of the competitors who were to represent them. No reply was received, and although everything was ready, I had (two days before the event) to telephone to Belfast and ask again for the names, at the same time pointing out that the delay was serious, inasmuch as route cards had to be posted. I was then informed that the committee of the Ulster Centre were very busy arranging for the End-to-end contest, and that they had a difficulty in getting anybody to compete, but at their request I arranged to leave the matter over till the next day. I telephoned again, and got the names, and arranged with the secretary to send checking sheets, etc., to him by that evening's mail, and leave the route cards for the Ulster men at their hotel in Dublin.

It is quite wrong for Mr. Lindsay to say that "it was understood, as per custom, that the last pair of riders would collect and bring the returns of the secret and open checking stations with them to the finish."

The contest was run under the strict rules of the Dublin and District M.C.C., and no rider in any competition interferes with the checking sheets. Our method is to appoint one person (a non-competitor) to arrange the checks, and he is furnished with a set of the sheets duly filled in with names, etc. These are collected by him and returned to the responsible official who works out the results.

In this particular contest my club arranged for two secret checks and the Ulster Centre officials for three, one to be taken by Mr. Lindsay, who duly turned up, but for reasons best known to himself his timesheet has not yet been sent in, and, therefore, delay was caused in sending up the results.

Such results as were published were meant really as the result of a competition run by the Dublin and District M.C.C. solely for their own members in conjunction with the inter-city contest.

We feel quite satisfied that even if Mr. Lindsay's time-sheet were forthcoming at this moment it would be found that the victory would lie with us.

JOS. L. WALSHE,
Acting Hon. Sec. Southern Centre M.C.U.I.

Carburetter Experiences.

Sir,—Mr. E. Mays's letter in your issue of last week, giving his experience with the Amac, interested me greatly. I ride a 1912 B.S.A. fitted with one of these carburetters. The engine starts as soon as the valve is dropped on quarter throttle, when the air lever is immediately opened to its full extent and kept there for the whole of any journey. When declutching it is only necessary quickly to pull back the throttle, and the engine will turn over quietly and without fuss at about 80 r.p.m. Geared a little lower than 4½ to 1, I can actually run at from 7 to 50 m.p.h. on the throttle only. Regarding petrol consumption, I recently rode from Wadebridge, Cornwall, to Clevedon, Somerset, a distance of 142 miles, on exactly a gallon of this expensive fuel. My weight is nearly twelve stones, and the machine was laden with luggage.

Personally, I ask for nothing better, and I do not for one moment think that the supposed single lever automatic carburetter would give it. I am entirely unknown to the Amac people. FRANK COMER.

The Freemasonry of the Road.

Sir,—During the last four weeks I have been calling on the trade in the home counties demonstrating a patent side-car on behalf of one of the large West End firms. On the 24th ult. I finished up at Dunstable, and was anticipating a pleasant run home. But alas! a mile or two only of the way had been accomplished when the head of my exhaust valve parted company from its stem and I was stranded. The worst of it was that my wife, who is not strong, was with me. I pushed the outfit for a time until a slight rise in the road compelled my wife to get out.

At this point a gentleman driving a Humberette stopped and, on hearing the trouble, kindly volunteered to call at a certain well-known garage in St. Albans and get a man sent out to meet me with a J.A.P. valve. Further, he offered to take my wife with him, with the idea that she should await my arrival at the above-mentioned garage, and thus be spared a nine mile walk—a feat of which she is utterly incapable.

Left to myself, I pushed on comparatively cheerfully for another mile or two, when I was overtaken by a gentleman driving a sidecar outfit. Without the slightest hesitation—although he had only been driving for a fortnight—he volunteered to tow me into St. Albans. On arriving at that ancient city with a light heart and a more or less paralysed left hand and arm, I was astonished to see my wife waiting outside the Langley Garage at the foot of the hill, for I had expected to see her at quite another garage at the foot of another hill elsewhere in St. Albans. She explained to me that Mr. Gibbons-Ropley (the driver of the Humberette) had gone straight to the garage we had agreed upon and had met with a most curt refusal to send the valve. He had then turned round and called at practically every garage in the town in unavailing attempts to get a valve sent to me. Finally he found a firm (the Langley Garage) willing to do their best, and, not having a J.A.P. valve in stock, turned up a temporary one. Not till then did Mr. Gibbons-Ropley proceed on his way. Who says the freemasonry of the road is dead? We represented rival establishments, and were absolutely unknown to each other.

By the way, when I was fixing my belt to the carrier of the unknown gentleman who towed me, I unfortunately left by the wayside an attaché case containing many spares, maps, a book of calls, a vacuum flask, etc., the contents of which I shall be happy to describe fully to anyone who may have picked the case up. R. MELVILLE BROWN.

An Explanation.

Sir,—As there seems to be some misconception regarding the oil I used in the Grand Prix and Spanish motor cycle race, I would ask you to mention in your valuable paper that I used Wakefield's Castrol C exclusively.

T. E. GREENE.

Fair Treatment.

Sir,—Having heard so much lately about delay in replacements by manufacturers, I feel that I should write and let you know my experience.

On July 25th, outside Llangollen, I broke a spring on my front forks. I wired to Messrs. Newman, of the Ivy Cycle Co., Birmingham, at 7.20 p.m. On the following morning the springs were here by 7.30, and I was ready to continue my tour by 8.30 a.m. Such promptitude is indeed rare and refreshing. OSCAR M. DE JONG.

Sir,—In January I got delivery of a 1913 machine. In the tool-bag was a note saying that certain accessories which appear in the specification would be sent as soon as received from the works. It is now June 25th and I am still lamenting the absence of these accessories. As all the later machines are being sent out complete (and several of the earlier ones were) I am becoming somewhat sceptical of the assurances that these articles will be forwarded as soon as possible. I think you will admit I have a grievance, and should be glad if you could give me any other advice than the historic "wait and see." MICAWBER II.

[We suggest that our correspondent puts his trouble before the makers.—ED.]

Sir,—I have seen a good many references to fair treatment in your columns and would like you to mention the following: Last year I insured a Minerva motor cycle with the North Western Insurance Co. A few weeks ago I had a bad smash, and when I came to claim from the above company I found that I had forgotten to get my policy endorsed for my new machine; thus I could not legally claim a farthing. I wrote the insurance company and explained what I had done (or left undone), and they, like bricks, accepted full responsibility, in spite of the fact that they had paid me a claim a few months ago for breaking a shop window, to the value of £13. WILLIAM LEES.

The surface of Porlock Hill, on the Somerset and Devonshire border line is now covered with two or three inches of dust, which, as may be imagined, makes skidding as prevalent as on muddy roads. The rider in the photograph is E. A. Colliver (7 h.p. Indian), competing in the M.C.C. West Country Tour.

ANOTHER **HORLICK** OFFER.

A LEATHER CASE WITH FLASK OF HORLICK'S LUNCH TABLETS.

To be attached to the Frame.

BY POST COMPLETE FOR 2/6

Also a New and Accurate Road Map of ENGLAND & WALES in Leatherette Case, with Roads shown in Colours and Classified, will be sent FREE with this Case and Flask.

THE LEATHER CASE illustrated is strongly made in solid, light brown leather, and is excellently finished. It may be attached to the handle-bars or frame in a convenient position, so that the Flask may be removed for use at a moment's notice without dismounting.

Horlick's Lunch Tablets contain all the valuable nutriment of full cream milk and choice malted grain in a convenient tablet form. A few dissolved in the mouth from time to time will supply the necessary nutriment to maintain strength and vigour, and restore energy when Touring or Racing, and are useful at all times.

PRICES: IN GLASS FLASKS TO FIT CYCLE CASES—ONE SHILLING EACH,

and in Sterilized Glass Bottles, from which these may be refilled, 1/6, 2/6, and 11/-, at all Chemists and Stores.

Send Postal Order to—HORLICK'S MALTED MILK CO., SLOUGH, BUCKS.

Nailsworth Ladder.

Sir,—In your issue of August 7th is a letter signed "J.W." with regard to an A.J.S. climbing the Nailsworth Ladder. We should like to point out that we claim that an 8 h.p. Williamson was the first passenger machine to climb this hill, Mr. Thornhill on one of our 8 h.p. air-cooled machines having been successful in March this year. The machine on which he climbed the Ladder was absolutely standard, and there are many witnesses who could corroborate the climb.

THE WILLIAMSON MOTOR CO., LTD.

Bon Camarade ie!

Sir,—I have seen many letters in *The Motor Cycle* telling of help rendered by motor cyclists, but I should like to mention the help given to me on Sunday by a rider of an ordinary push cycle, who spent from 11.30 till 5 o'clock helping me to dismantle and more or less repair a three-speed hub on the road. I might mention that neither of us had even seen inside one of these things before, but we managed to get it from a state of being entirely jammed to work on top and middle gears, but never again will I touch it on the road if I can help it. I consider that, for a working man to give nearly six hours of his one free day to such a job was one of the most sporting things of which I have heard.

J. C. MILLS.

Hub and Counter-shaft Gears.

Sir,—You are quite correct, hub gears are *not* perfection yet. I rode a 2½ h.p. lightweight last year, and the three-speed hub gear gave no trouble during about five thousand miles. This year I have had a 3½ h.p. machine with three-speed hub gear, and it has been a constant source of trouble. I have had a new gear fitted, but the result has been the same "trouble." Clutch slip has been the most prominent, and, as you say, it is best not to use the clutch; in fact, I have been riding without any clutch rod at all. As the engine has a decompressor, no clutch is needed. The conclusion I have come to is that hub gears are all right for lightweights, but will not stand the kick of a healthy 3½ h.p.

A N 1231

Sir,—"Ixion" mentions that some of his readers have been enquiring whether he has lost his enthusiasm for the counter-shaft drive. We, personally, are not surprised if this is true.

The growing interest in the countershaft drive, brought about by variable gears, not of the hub type, led us to experiment with the counter-shaft three-speed gear in order to determine which was the best form of gearing. We have fitted a number of machines with counter-shaft gears, and after many thousands of miles our own opinion coincides with that of other experts who have tried both the hub gear and the counter-shaft gear, which is that the hub gear is far superior to the counter-shaft. To sum up, in the counter-shaft gear we find the following objections:

The gear runs at high speed and considerable noise is created.

The small chain from engine to counter-shaft adds to the noise, and moreover wears out in about 1,500 miles or less, even when constantly lubricated (which is absolutely essential).

The drive is fiercer and wears the back tyre out much more quickly.

The vibration at all speeds is most noticeable, and very objectionable when engine is running slowly.

The only point in its favour is that the back wheel can be removed more quickly for tyre repairs, but this advantage, of course, would only apply to the novice.

With the hub three-speed gear, of which about 14,000 Sturmey-Archers are now running, we find by comparison the following advantages:

No vibration.

No noise.

An elastic drive; therefore less wear and tear on all working parts, and normal tyre wear.

No driving chain to lubricate, adjust and look after.

Recent trials, such as the Scottish Six Days, have proved that hub gears are improving rapidly, and we feel sure that the man who has tried first a counter-shaft and then a hub gear, would never think of making the counter-shaft his choice.

Theoretically the counter-shaft gear sounds the right thing, and we believe that is why the idea has found favour with quite a large number of people, who in practice would find that it is not nearly so satisfactory as the hub gear.

It would be interesting to hear the opinions of others who have practical experience of both counter-shaft and hub gears.

STURMEY-ARCHER GEARS, LIMITED.
Harold Bowden, Director.

Dangerous Driving.

Sir,—There was a bad specimen of the road hog between Virginia Water and Staines on the evening of August 4th. I have the number of the car, a grey two-seater, with the chauffeur sprawling on the tailboard, and if I can get some more witnesses I am prepared to summon him.

Will the driver and passenger on the sidecar which he was preventing from passing please communicate with me, c/o the Editor, and also the driver of the Brooklands racing car with whom he nearly collided?

One expects a certain amount of bad driving from amateurs and inebriates on Bank Holidays, but maliciously bad driving must be stopped.

E. STANLEY HARPHAM.

A Bird in the Horn.

Sir,—I should like to know if any of your readers have ever had an experience like the following: One day recently whilst driving I suddenly noticed that the note of my Lucas horn became very faint, but imagined that some dust had lodged in the tongue of the reed and did not trouble to examine the horn. The same condition was apparent the next day, and I examined the horn, and found a house sparrow firmly wedged head first into the mouth of it. It must have flown in as I met it along the road. The mouth of the Lucas horn is, as you know, very deep, and this accounts for my not perceiving it at once. Of course, the bird was dead when I removed it. This is a solid fact, and can be vouched for by the proprietor of the garage I use, whom I called to examine the horn before removing the bird.

J. C. PRIOR.

Automatic Carburetters.

Sir,—I was considerably interested in "Autobore's" letter, in your issue of the 24th ult., *re* the B. and B. variable jet carburetter, as I have used them for the last two years with results considerably above the average.

My present machine is a standard touring 1911 Norton, 82×94 mm., with a compression space of about 127.5 c.c., and on a run from Derby to the east coast and back I actually covered 209 miles on 1.42 gallons of benzole, which equals 147 m.p.g.

I have fitted up an extra lever on handle-bar, and Bowden wire to operate the variable jet, so that I can easily make a fine adjustment of the jet area while riding at any speed, and I use this lever a good deal. It is to this, in conjunction with the B. and B. carburetter, that I attribute the remarkably low consumption. The carburetter also has the virtue of extreme flexibility, as I can throttle down to 5 m.p.h. on level, or walk by the machine firing regularly on a 3¾ gear. This carburetter is well named the Universal model as it can be instantly set for maximum speed and power, minimum consumption, or ideal slow running with a rapid acceleration. It is, in fact, a carburetter which can be made large or small at will, with the jet and throat areas always bearing a correct relation to one another. With a carburetter having a fixed size of jet and throat (or choke), the velocity of air past the jet when going dead slow is too low to ensure proper atomization, unless far too small to enable the engine to develop full power at high speeds. I may add that I have no interest in the B. and B.

Herts. County and Public Schools Club Hill-climb.

B. C. Barton (5 h.p. Hazlewood) nearing the finishing banner.

THE hill-climb organised by the Herts County Automobile and Aero Club and the Public Schools Motor Cycle Club at Kop Hill, Princes Risborough, on Saturday last, was not quite the success it should have been, partly owing to the vagaries of the weather and partly to the paucity of entries.

In the Public Schools events there were but five competitors in the 600 c.c. class and seven in that open to any machine, while those who competed had entered also in the Herts County events. Thus the event was spoiled from the spectators point of view, as the same machines competed in each class, and the absence of any sensational climb, coupled with occasional showers of rain, sent most of the spectators home before all the classes had been run off.

In the 600 c.c. class for the Public Schools entry, Selby, who lead off, brought his water-cooled Regal-Green up the hill at a good pace. Keller (Triumph), who made fastest time in his class, came up splendidly, the engine "revving" in a surprising manner, even on the steeper gradients at the summit. The Hazlewood seemed slow, but probably obtained third place by reason of a good start. The unfortunate Roberts brought his Rover up to the first bend at a good pace, rounded it well, and then was stopped with a broken belt-fastener. A. Q. Roberts ran his 2¾ T.T. Douglas in this class, as there were insufficient 350 c.c. entries to allow of a separate class. The Douglas appeared to be over-geared for the hill.

In the open class Kennedy's V.S. got away at a great pace, leading Getting's 8 Bat, while, as usual, the Zenith made a fine climb, Luce giving an exhibition of clever gear changing.

The 350 c.c. Herts County event resulted in a win for the little Humber ridden by Anderson. Knowles (Torpedo) rode very steadily but appeared much slower.

FULL SPEED UP KOP HILL. HOW THE DUTCH MOTOR CYCLISTS WOULD LIKE TO HAVE MADE THE ASCENT.
J. Cocker (Singer) just past the bend. He was only beaten by ⅕sec. by an 8 h.p. twin-cylinder machine—A. J. Brewin (8 h.p. Zenith).

erts County and Public Schools Club Hill-climb.—

There being very few starters in the 500 c.c. class this as not particularly interesting, the only incident being aused by the Grandex, which failed to start, owing, it as said, to the air gauges being still in place and the achine being adjusted to start without them. G. L. Vilks, who was placed second, did not appear in the rogramme, which caused some confusion.

A Nasty Fall.

Brewin's 8 Zenith, freed from its sidecar, literally flew up he hill in the fastest time of the day, while Kennedy started s fast, but ran off the road at the first bend. For a second he machine plunged wildly, what time the spectators bolted or cover; then, with a huge swerve, it struck the opposite ank, leaped and bounded for perhaps a second or more, and, winging round on to the road, turned over with a terrific rash. Before the dust had rolled away a dozen people were elping Kennedy up, to find that he was cut about the hand ather badly, had one knee of his breeches torn, but was unurt otherwise. The machine was slightly damaged, one otrest and the brake pedal being badly twisted, and the oil ump plunger bent. The accident seemed to be due to the efective condition of the exhaust valve lifter.

As the passenger class had but one starter, it was a walk ver for Brewin's Zenith, and the general class resulted in nother success for Anderson's Humber. The results were s follows :

PUBLIC SCHOOLS.—Class 1., not exceeding 600 c.c.

		Time.
1.	R. L. Keller (3½ Triumph)	55⅘s.
2.	J. C. Selby (3½ Regal Green)	59⅕s.
3.	B. C. Barton (5 Hazlewood)	61⅖s.

PUBLIC SCHOOLS.—Class 2, open.

1.	J. Kennedy (8 V.S.)	49⅖s.
2.	A. J. Luce (8 Zenith)	49⅘s.
3.	E. T. Getting (8 B.A.T.)	52⅕s.

HERTS COUNTY.—350 c.c.

1.	M. Anderson (2¾ Humber)	60⅘s.
2.	H. S. Knowles (2½ Torpedo)	72s.
3.	M. Heinzel (3 N.S.U.)	75⅗s.

HERTS COUNTY.—500 c.c.

1.	J. Cocker (3½ Singer)	50⅗s.
2.	G. L. Wilks (3½ Triumph)	—
3.	M. Heinzel (3½ N.S.U.)	63⅗s.

HERTS COUNTY.—Open.

1.	A. J. Brewin (8 Zenith)	48s.
2.	J. Cocker (3½ Singer)	48⅘s.
3.	M. Heinzel (3½ N.S.U.)	55⅕s.

HERTS COUNTY.—Passenger machines.

	A. J. Brewin (8 Zenith)	57⅖s.

HERTS COUNTY.—Formula class.

1.	M. Anderson (2¾ Humber)	4145.63
2.	H. S. Knowles (2½ Torpedo)	5562.79
3.	— Hall (8 Matchless)	7140.95

THE SPECIAL RESERVE (ROYAL ENGINEERS): Conditions of Service.

We give below some brief particulars concerning the conitions of service which will be of interest to motor cyclists ho contemplate joining the special reserve.

AGE OF ENLISTMENT.—18 to 30 years.

PERIOD.—For four years.

Recruits on final approval will be promoted to the rank of orporal. They will thus become members of the sergeants' ess from the first day of joining.

TRAINING.—Recruit training not less than seven days or ore than fifteen. To include pistol practice.

ANNUAL TRAINING.—Fifteen days with regular signal unit which they are attached.

PAY AND ALLOWANCES.—Pay and allowances during the riod of training will be received as follows: Regimental ay, 2s. 6d. per diem; messing allowance, 3d. per diem; ration allowance, 6d. per diem; clothing allowance, 6d. per diem; motor cycle allowance, 8s. per diem.

MARRIED MEN.—Separation allowance. If separated, for wife 1s. 1d.; children, 2d. each.

BOUNTIES.—Training: £1 received at end of training. Non-training: £1, October 1st; £1, December 1st; £1, February 1st; total, £4. The issue of bounties will be subject to the cycle of the non-commissioned officer coming up to the required specification at the annual inspection.

TRAVELLING ALLOWANCE.—Motor cyclists will receive travelling allowance at the rate of 1½d. per mile for the shortest suitable route between their homes and the place of training.

Applications should be made to Capt. R. C. Aplebie, R.A., Sefton Barracks, Upper Warwick Street, Liverpool.

J. Bates (2¾ h.p. Douglas) at the corner on Cudham Church Hill in the South-eastern Club's inter-team trial.

The B.M.C.R.C. Sixth 1913 Monthly Meeting.

Start of the 500 c.c. race from the railway straight.

THE above event, which was held in dull and rather cool weather last Saturday afternoon, was both bright and interesting. The programme was a short one, but quite entertaining, and there was a very fair attendance. The chief features of the meeting were the three sealed handicap races, which were an innovation.

Event No. 1 was the 350 c.c. Ten Mile Record Race and Sealed Handicap. The prizes were gold, silver, and bronze medals, which were awarded both on the time and handicap results. The competitors were started from scratch at the beginning of the railway straight and passed the fork four times.

The first time past the fork, Mason, Stanley and Williams came past in a group, while after an interval the rest came by in the following order: Newman, Colver, Iron, and Newbold.

In the next lap the invincible Stanley led by a good distance, while Mason and Williams were having a tussle for second place. Martin retired with a faulty magneto in the first lap, and in the second Newbold dropped out. In the third lap Stanley greatly increased his lead, Mason was second, and Williams third. In the last lap Stanley rolled in with his engine shut off before the others were even in sight. The results given on both time and handicap were as follows:

TIME.

	Rider and machine.	mm.	c.c.	m.	s.	m.p.h.
1.	G. E. Stanley (1-cyl. Singer)	75×79	349	9	54⅖	60.56
2.	H. Mason (2 Nut-Jap) ...	60×61	350	10	36⅘	
3.	C. Williams (1 A.J.S.) ...	74×81	348	10	47⅗	
4.	H. Newman (1 Ivy-Precision)	70×90	346	11	4⅖	

HANDICAP.

	Rider and machine.	mm.	c.c.	Start. m.	s.	m.	s.
1.	C. Williams (1-cyl. A.J.S.) ...	74×81	348	1	54	8	53⅗
2.	G. E. Stanley (1 Singer) ...	75×79	349	scr.		9	54⅖
3.	D. Iron (2 Enfield)	54×74	343	1	54	10	35
	H. Newman (1 Ivy-Precision)	70×90	346	0	29	10	35⅖

Event 2 was the 500 c.c. Ten Miles Record Race and Sealed Handicap which was run under the same conditions and for the same prizes as the above.

The first time past the fork the order was as follows: Stanley, Brewster, Victor, Hill, McDonagh, Cushman, Le Vack, Baker, and Nicholson.

In the second lap Stanley still kept his lead, while Victor and Hill came in second and third.

In the third lap Stanley greatly increased his lead, but the first and second remained as before. In the final Stanley again shut off and glided in well ahead of everyone else.

TIME.

	Rider and machine.	mm.	c.c.	m.	s.	m.p.h.
1.	G. E. Stanley (1-cyl. Singer)	85×88	499	9	3⅕	66.27
2.	L. Hill (1 Rudge)	85×88	499	9	25⅘	
3.	E. H. Victor (1 Singer) ...	85×88	499	9	29	

HANDICAP.

	Rider and machine.	mm.	c.c.	Start. m.	s.	m.	s.
1.	E. H. Victor (1-cyl. Singer)	85×88	499	1	3	8	26
2.	G. E. Stanley (1 Singer) ...	85×88	499	scr.		9	3⅕
3.	P. Brewster (1 Zenith-Jap)	95×77.5	498	0	37	9	20

Event 3 was the 1,000 c.c. Ten Mile Record Race and Sealed Handicap, run under the same conditions and for the same prizes as the above. At the start, Martin had the bad luck to slip as he was mounting his machine, and, falling heavily on the track, injured his hip somewhat severely.

The first time past the fork Remington led, followed by George, Howard, Baldwin, and Baragwanath.

In the second lap Remington forged ahead, Howard ran second, and George third.

In the third lap Remington increased his lead still further, Howard came second, and Baragwanath third. George retired first and Baldwin later in this lap. The result was an easy win for Remington.

TIME.

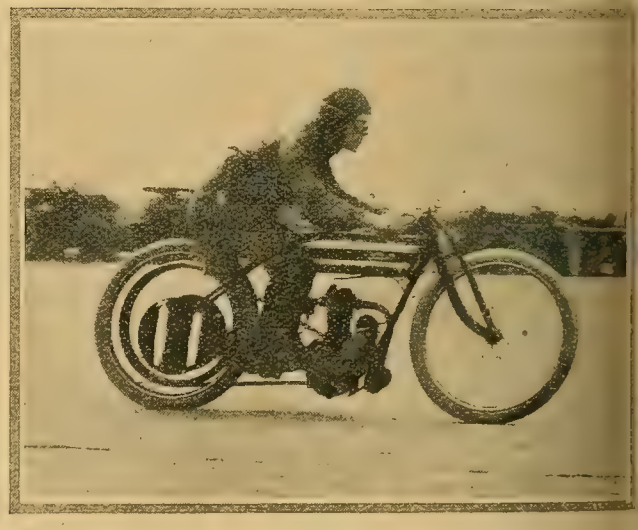
		mm	c.c.	m.	s.
1.	E. Remington (2 Matchless-Jap) ... Speed, 74.04 m.p.h.	90×77.5	986	8	6⅕
2.	W. G. Howard (2 Matchless-Jap)	90×58	738	8	54⅘
3.	E. C. E. Baragwanath (2 Matchless-Jap)	90×77.5	986	9	6⅗

It will be noticed that the Matchless machines swept the board, and it is interesting to note that Remington's fastest lap was accomplished at the excellent speed of 80.45 miles an hour.

In each of the foregoing races the times are better than record, though the speeds must have been higher in existing fifty mile records. The question of accepting the times as record is being considered by the A.C.U.

HANDICAP.

	Rider and machine	mm.	c.c.	Start. m.	s.	m.	s.
1.	W. G. Howard (2 Matchless-Jap)	90×58	738	1	6	7	48⅗



An impression of G. E. Stanley (Singer) at speed. He won the first two races.

AUTOMATIC CARBURETTORS

(BINKS SYSTEM.)

REPRINT FROM THE **AUTOCYCLE.**

AUTOMATIC CARBURATION.

May I, as a very satisfied user of the "Binks carburettor," just say a few words to Mr. Turner? In my opinion, he does not understand how the "Binks carburettor" works. The air lever on a two-lever carburettor does not control the power given out by the engine; it is the engine speeds that indirectly control the air lever; and I wish to try and point out to him how it is possible to do this automatically.

With a "Binks two-jet carburettor," if the engine is running slowly, it is possible to climb any ordinary hill on the pilot jet, that the motor cycle will climb at the same pace with a two-lever carburettor.

Owing to the fact that the pilot jet has a very small choke tube, it is possible to run much slower and get much more power running slowly than with a two-lever carburettor. Likewise, the main jet having a very large choke tube, it is possible to get much higher speeds, and all the air passes straight across the jet, thereby vaporising the petrol more thoroughly.

By opening the throttle of the Binks, one gets a perfectly smooth acceleration, as with a car, because the mixture is absolutely correct at all speeds.

Suppose, for the sake of argument, Mr. Turner is out with his two-lever carburettor, and I am out with my Binks—

(1.) We are running on the level slowly. He has his extra throttle almost shut, and the extra air completely shut. I am running with the pilot jet, and even that is shut down a bit. This would be a much smaller jet than his, thereby saving petrol, yet it gives the same mixture as his, because my choke tube is so much smaller.

(2.) We are running at 50 m.p.h. all out on the level. He has his throttle and air full open. I just move the one lever to fully open the main jet, and when the machine has gained speed sufficiently I move the lever a little further open, and this opens an extra port, thereby getting the perfect mixture for high speeds.

(3.) We come to a hill, and Mr. Turner has to close his extra air slightly as the engine speed decreases. I close my throttle lever a little, and this shuts off the extra air port, but does not move far enough to throttle the engine at all.

(4.) As to his slow climb, I have already said that a machine will climb just as slowly and give more power at slow speeds on the pilot jet of a Binks than with a two-lever carburettor. I know this by experiment.

As to other automatic carburettors, I quite agree with Mr. Turner, they are useless. The only automatic carburettor that gives the correct mixture at all speeds is the two-jet carburettor. I have no interest in Mr. Binks or his splendid carburettor, except as a very satisfied user, and I should like to say that Mr. Binks gave me great assistance by post in regard to tuning it up to suit my machine. My advice to Mr. Turner is, "Buy a Binks, test it, and then give us his opinion of the two-jet automatic carburettor."

A. G. STORY.

I am greatly obliged to Mr. Story, who I do not know in the least, for his letter.

Mr. TIPPET, the well-known Tourist, writes:—

Received carburettor safely, and in the recent Devonshire hill-climbing tour it gave plenty of power on the test hills, and the petrol consumption on the whole 440 miles was only 3½ gallons. On ordinary roads I am sure to get quite 130 miles to the gallon on my 3½ Humber.

WHY NOT YOU DO LIKEWISE.

YOU CAN'T DO IT WITH ANY OTHER CARBURETTOR

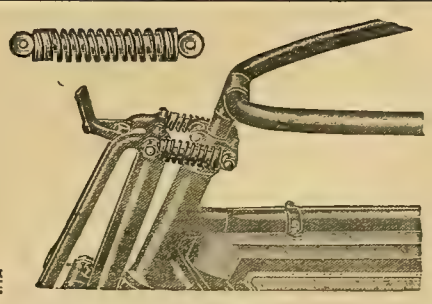
TYPE 6D. **4/-.**



TERRY'S SPRING LINK absorbs road shocks.

It is a wonderful auxiliary to motor cycle front fork springing—taking up all the shocks uneven road surfaces create and imparting to the motor cycle the comfortable easy gliding motion of the car. Vibration is reduced to a minimum—and, of course, great economy in running costs is effected. It can be fitted to any front fork of link type. For 3 h.p. machines **10/-**, 6 h.p. **12/6** per pair. Write now for descriptive leaflet—It is post free.

he B.M.C.R.C. Sixth 1913 Monthly Meeting.—

E. Remington (2 Matchless-Jap) ... ... 90×77.5 986 0 14 7 52⅗
E. C. E. Baragwanath (2 Matchless-Jap) ... ... 90×77.5 986 1 6 8 0⅗

Event 4 was the All Comers' Three-lap Handicap. As Remington, Victor, and Williams had won previous races, their handicaps were altered accordingly. All got off the mark well, except Baker and Baragwanath.

Newbold came by at the end of the first lap before the wo scratch men had started. He was followed by Iron, Villiams, Colver, Greenfell, Cushman, Barnes, Newman, O'Donovan, Stanley, Nicholson, Victor, Le Vack, Hill, Brewster, Baragwanath, Baldwin, Remington, George, and Baker. McDonagh retired

In the second lap the order was, Newbold, Williams, ron, Stanley, Greenfell, Victor, Barnes, O'Donovan, Colver, Cushman, Newman, Brewster, Baragwanath, Hill, Reming-on, Le Vack, George, Baldwin, and Baker. Nicholson etired. Newbold made the best of his long start, and came n an easy winner, but Remington had travelled magnifi-ently, and came in second, with Stanley a good third. Newbold's speed was 52.60 m.p.h., while Remington's fastest ap was 76.31 m.p.h.

The order of finishing was as follows:

		mm.		c.c.	Start. m. s.
1.	P. Newbold (1-cyl. Zenith)	85	× 60	345	2 51
2.	E. Remington (2 Matchless)...	90	× 77.5	986	0 9
3.	G. E. Stanley (1 Singer) ...	75	× 79	349	1 18

	G. W. Baker (1 Peerless) ...	85	× 88	499	1 42

FORTHCOMING OPEN EVENTS.

Coventry Club's Eighth Annual Hill-climb.

The eighth annual hill-climb of the Coventry and Warwickshire Motor Club will be held at a secret venue on Saturday, September 6th. All classes of machines will be catered for.

Speed Trials in Lincolnshire.

The East Midland Centre of the A.C.U. will hold an open speed trial at Thonock Park, Gainsborough, on Sept. 6th. There will be "expert" and "general" classes for machines up to 350 c.c., 500 c.c., 1,000 c.c., sidecars and cycle cars, and half mile flying start (any capacity). Also the East Midland Challenge Trophy for teams of three riders. Entry forms and full particulars from Mr. J. King, 42, Radcliffe Road, Nottingham.

Speed Trials at Weston-super-Mare.

The Bristol M.C.C. intend holding open speed trials at Weston-super-Mare on October 4th. Six open and three club classes have been arranged, also a match between a Brooklands rider and a club member driving a racing Straker-Squire.

Scottish Open Speed Championships.

The Scottish Auto-cycle Union will hold the Scottish motor cycle speed championships on the West Sands, St. Andrews, on Saturday, September 6th, at 1 p.m. (Eliminating heats, if necessary, from 11 a.m.) There will be nine classes, six of which will be open to all-comers, the last three being "expert barred." Gold, silver, and bronze medals will be awarded to the first, second, and third respectively in each class, the gold medal in the case of the "open" classes carrying with it the title of "champion of Scotland." Entry forms are obtainable from all club secretaries and at garages, or from the secretary of the Scottish Auto-cycle Union, Mr. James S. Fulton, 131, West Regent Street, Glasgow. Entries close on August 27th.

OPEN EVENTS.

1. Scottish Lightweight Championship for motor cycles not exceeding 350 c.c. Distance, twenty miles
2. Scottish Medium-weight Championship for motor cycles exceeding 350 c.c. and not exceeding 560 c.c. Distance, twenty miles.
3. Scottish Heavyweight Championship for motor cycles exceeding 560 c.c. and not exceeding 1,000 c.c. Distance, twenty miles.
4. Sidecar race for motor cycles not exceeding 560 c.c. Distance, one mile.
5. Sidecar race for motor cycles exceeding 560 c.c. and not exceeding 1,000 c.c. Distance, one mile.
6. Cycle car race for machines not exceeding 1,100 c.c. and 7 cwt. unladen. Distance, one mile.

"EXPERT BARRED" EVENTS.

7. Three-lap race for motor cycles not exceeding 350 c.c. Approximate distance, 6½ miles.
8. Three-lap race for motor cycles exceeding 350 c.c. and not exceeding 560 c.c. Approximate distance, 6½ miles.
9. Three-lap race for motor cycles exceeding 560 c.c. and not exceeding 1,000 c.c. Approximate distance, 6½ miles.

The sands at St. Andrews have been found to be excellent for the purposes of motor cycle racing. There is ample room for a perfectly safe "oval" circuit with wide ends, the sides of which will each measure a mile, the circuit further providing ample room for starting, pulling up in the mile sprints, and turning. The surface is exceptionally hard.

RANGOON M.C.C. RELIABILITY TRIAL.

The first run took the form of a reliability trial from the Pegu Club to the junction of the Pegu and Prome roads and back (about twenty-two miles each way). Results: 1, C. Fouracres (Triumph); 2, P. Vieland (Rudge). The following made scores of over 200: M. Burnett (Triumph), R. Charleswood (Rover), J. Anderson (P. and M.), R. Best (Triumph sc.), F. Mann (2¼ F.N.), W. Turner (Ariel), M. Rorke (Rover), R. Wenning (Rover sc.), and C. Johnstone (2 Humber).

SETTING OFF FOR A WEEK-END CAMP IN NORTH WALES.

W. Baseley and family, of Alvechurch, Birmingham, on their 6 h.p. Royal Enfield sidecar combination. An amount of camping outfit, as may be seen, is being carried, as well as a large basket on the luggage carrier and further luggage in the fore part of the sidecar.

TIME TO LIGHT LAMPS.

Aug. 14th	...	...	8.24 p.m.

,, 18th	...	...	8.16 ,,
,, 20th	...	...	8.12 ,,

An Abandoned Midland Event.

The Nottingham Club's open trial last Saturday had to be abandoned owing to lack of entries. One of the reasons advanced to the organising secretary by manufacturers for withholding support was that "the press do not give prominence to Nottingham trials."

Durham Road Closed.

The North-Eastern Automobile Association is officially informed by the Durham Rural District Council that the road past Neville's Cross, used as a short cut by through traffic to avoid Durham city, will be closed from August 11th to September 11th for improvement work. Motor cyclists, therefore, will be obliged to pass through Durham city, and are urged to drive with special caution through the narrow streets of the town.

Interesting Road Census.

The following facts of motor traffic on one main road, London to Worthing, on Saturday, Sunday, and Monday (August Bank Holiday) are interesting:

	Motor Cycles (solo).	Sidecars.	Cycle Cars.
Saturday ...	185	345	10
Sunday ...	140	195	37
Monday ...	180	250	10
Total ...	505	790	57

These were all taken by observers specially placed and each one checking only one sort of motor vehicle. 'Buses, engines, vans, etc., were not checked. Time, 8 a.m. to 8.30 p.m. All were taken on the same point of the road, namely, West Grinstead, on the main road.

THE LANCASTER PAGEANT.
A warrior of old on his warhorse of modern times.

The Scottish Dialect—with Apologies to the Scotch.

Two competitors in the recently held Scottish Trials who were endeavouring to imitate the Scottish dialect which they heard on all sides, are alleged to have had the following conversation on the morning of the first day:

First rider: How are ye the noo?
Second ditto: Am-ul-ree-t!

However, he forgot the hairpin on Amulree and was soon Am-ul-wrong!

FUTURE EVENTS

Aug. 18-23.—A.C.U. SIX DAYS' TRIALS Carlisle as Centre.
,, 30.—Streatham and District M.C.C.
,, 30.—Hertfordshire M.C.C. Open Trial
Sept 6.—Coventry and Warwickshire M.C. Annual Open Hill climb.
,, 6.—A.C.U. East Midland Centre Speed Trials.
,, 13.—B.M.C.R.C. Race Meeting.
,, 20.—Streatham M.C.C. Open Speed Trials at Brighton.
,, 24.—A.C.U. Open One Day Trial.
,, 27.—B.A.R.C. Brooklands Meeting.

The Circuit de la Sarthe.

The Grand Prix Race has taught French manufacturers of cycle cars many a useful lesson. It was noticed that in the International Cup Race at Le Mans that the competing machines kept going with wonderful regularity. One cycle car, however, with centre steering front axle lost this important fitting while travelling at full speed. The sidecars were not equal to the cycle cars in speed.

In the motor bicycle races J. W. Woodhouse rode finely and deserved his success. Greame Fenton's retirement was due to running off the road at the first bend on the initial circuit.

A Flying Meeting for Motor Cyclists.

The proprietors of the London Aerodrome, Hendon, N.W., have arranged to hold a special flying meeting, in which some of the most famous aviators will compete, on Thursday, August 28th, beginning at 3.30 p.m. and continuing until dusk (about 8 p.m.) This meeting is intended specially for motor cyclists, and will be held under the patronage of the Auto Cycle Union. All attending the Aerodrome on motor cycles, cycle cars, sidecars, etc., will be admitted at half-price to the 1s. and 2s. 6d. enclosures on presentation of their membership cards. Free passenger flights are offered to readers of *The Motor Cycle*. The card of membership to the club to which motor cyclists belong should be presented.

SPECIAL FEATURES:

A MECHANICAL TIMING DEVICE.
EXPERIENCES WITH PASSENGER MACHINES.
ENTRIES AND ROUTE MAP FOR THE SIX DAYS' TRIALS.

A Dutch Three Days' Trial.

Starting on Tuesday from Amsterdam, Sam Wright is driving a Humberette in a three days' reliability trial over indifferent roads. It is unlikely that he can get back in time to compete in the Six Days' Trials next week.

Hotels during the Six Days' Trials.

The following is a list of the hotels at which lunch will be taken during the A.C.U. Six Days' Trials: Monday, Royal Hotel, Keswick; Tuesday, Ingleborough Hotel, Ingleton; Wednesday, Drill Hall, Ulverston; Thursday, Rose and Crown Hotel, Durham; Friday, Stag's Head, Bowness. Official headquarters, Central Hotel, Carlisle.

Corwen-Cerrig Road.

At this season of the year the main Holyhead Road is used by so many motor cyclists on the way to the North Welsh coast that those contemplating a journey which includes the section from Corwen to Cerrig-y-druidion will be glad to hear that the surface has much improved. In May there were very deep ruts and ridges of mud churned up by the steam traction engines which run between Corwen Station and the Liverpool Waterworks at Cerrig. Most of these ruts have been filled in and steam rolled, and the mud ridges shovelled to the roadside, where they lie in heaps. Although the road for three or four miles from Corwen is still bad, it was (when we rode over it last week) no longer a danger to traffic. The worst section is in Merionethshire, which county is left 3 miles 6 furlongs from Corwen.

Another well-known character at the Lancaster Pageant. They rode into Lancaster on their motor cycles, and were in themselves an excellent advertisement for the pageant.

THE STAFFORD PAGEANT.

A. Garner as Richard II. taking Queen Elizabeth (Mrs. Burekhardt) to the Stafford Pageant on his 3½ h.p. Triumph and sidecar.

Nap Hill in the Dutch Trial.

A. R. Abbott writes to say that his stop on Nap Hill in the Anglo-Dutch Trial was due to being baulked by the Cyclonette. He restarted with the aid of the clutch, and was subsequently awarded full marks on reporting the circumstances to the judges.

A Real Hill.

Rosedale Abbey Bank, near Pickering, Yorks, has just been climbed on a two-speed B.S.A. by H. Taylor, junr., of Beverley, though 6 h.p. twins among the party failed. The bank is about a mile long and is as bad as Stoupe Brow, near Robin Hood's Bay. Previously, it had only been climbed by F. Philipp on a Scott and J. W. F. Tranmer on a 10 h.p. Stoewer car geared 24 to 1.

A Strenuous Holiday.

Our contributor "Mercury" has crowded as much motor cycling into his holiday as it is possible to imagine. In twenty-seven days he has covered 2,490 miles, and included in this distance were 980 miles of the Scottish Trials, in which he gained a gold medal. He rode up to Perth from Berkshire, then followed the trials, and the day after the finish he started off on his P. and M. for South Wales. "Mercury" asserts that the corner work encountered in the Scottish Trials improved his cornering 50%, and we can well believe him from our own experience. During his trip down from Edinburgh he took the opportunity of trying one or two of the test hills selected for the A.C.U.'s Six Days' Trials.

Adventures in Scotland.

"Mercury" had several exciting and interesting moments in Scotland during the Trials. He was on the spot at the precise moment when the G.W.K. burst into flames a few hundred yards above the Devil's Elbow on the Spital of Glenshee, and noticed a puff of smoke and flame shoot out as he was following it. A moment later it was all ablaze. "Mercury" himself escaped trouble during the trials, but as soon as they were over minor misfortunes fell upon him. Such is luck! His machine should know its way up the hills of Britain, as during the past month it has climbed Porlock, Kirkstone, Shap, Lynmouth, Birdlip, Ballymacrow, Amulree, Kenmore, Applecross, and Mam Ratachan.

A French Road Race.

The Liège-Paris-Liège Road Race is to take place on the 15th and 17th insts. On Friday there will be a speed trial, and a hill-climb during the return journey to Liège. There were three successful British riders last year.

A Splendid Record.

The performance of the English trade team in the Anglo-Dutch trial was really wonderful. Each of the nine representatives accomplished a non-stop run and arrived home within schedule time, thereby gaining gold medals. Frank Smith's non-stop was only achieved by riding the last thirty miles on a flat driving tyre.

Auto Cycle Union Notes.

THE INTERNATIONAL TOURING TRIAL.—It is a little disappointing that this the first competition suggested by the recently resuscitated F.I.C.M., which should be the most important international event of the year, should find only two teams to compete in the international touring trial held in conjunction with the A.C.U. Six Days'. These teams are as follows: England—350 c.c. class, W. B. Gibb (2¾ Douglas); 500 c.c. class, W. B. Little (3½ Premier); passenger class, C. R. Collier (8 Matchless sc.) France—Guillereau (Clément-Gladiator); Gabriel (Clément-Gladiator); passenger class, L. Bourbeau (Bedelia cycle car). It is not yet known in which classes the Clément riders will enter. Countries entering are entitled to enter either two 500 c.c. machines, or one of 500 and the other of 350 c.c.

PERMITS.—The A.C.U. has granted permits for the following competitions: Stockport and District M.C.C. open hill-climb, August 30th, and the East Midland Centre A.C.U. speed trials, Sept. 6th.

'Ware Flints.

A correspondent tells us that the Flintshire County Council intend to apply for powers to fix a ten-mile-an-hour speed limit for motors over the whole county. Comment is needless!

A New Three-speed Gear.

Mr. Pedersen, the inventor of the three-speed hub gear for pedal cycles, has patented a three-speed gear for motor cycles which can be fitted in the hub or bottom bracket. It has been tested on a 3½ h.p. motor cycle, and is about to be tried on a 2¾ h.p. sidecar combination. The gear will be manufactured in Dursley by the Pedersen-Alpass Three-speed Motor Hub and Gear Co.

Stolen Machines.

A 1913 model chain-driven B.S.A. with sidecar were stolen from Bridlington on Wednesday last week. The frame number is 3926, and the engine 4228.

A 1913 Triumph, only a month old, engine No. 216,016, was stolen from outside Stratheden, Eaton Crescent, Clifton, the other day. The owner is Mr. S. Brown.

The Gordon in Scotland.

The performances of some of the machines in the Scottish Trials, which finished but did not gain premier awards, were, perhaps, rather overshadowed by the doings of the gold medal winners. One of the less fortunate was the Gordon cycle car, inasmuch as it finished the 980 miles without trouble, but did not qualify for a gold medal, as the average speed of twenty miles an hour over the severe course was rather more than its driver cared to maintain on a standard geared two-speed cycle car. Nevertheless, it finished in good fettle, and for its first performance in a big trial did remarkably well.

SOUTH-EASTERN COUNTIES INTER-CLUB TEAM TRIAL.
Two competitors ascending Salt Box Hill in a cloud of smoke.

Climbing Comparisons on Porlock.

THE ACTUAL SPEEDS ATTAINED DURING THE M.C.C. TEST.

SOME interesting comparisons in regard to hill-climbing powers of various types of motor cycles, sidecars, and cycle cars can be gleaned from the perusal of the official results of the climb of Porlock on the recent Bank Holiday run of the Motor Cycling Club to the west of England. Last week we published a full account of this run, together with the official figures relating to the Countisbury climb, and now we are enabled to give the figures for Porlock. The competitors were divided into three classes, A, B, and C, according to the machines they rode. A represented 350 c.c., B 500 c.c., and C the unlimited class. Minimum speeds up Porlock were arranged as follows for the three classes : A 10, B 12, and C 14 m.p.h. Naturally enough the fastest speeds were obtained by the big machines, the highest being accomplished by G. T. Gray (5-6 Rudge-Multi), who got up at an average speed of no les sthan 19.72 m.p.h., closely followed by B. A. Hill (7 Indian) and A. J. Dixon (3½ Singer) in 19.69 and 19.01 respectively. The latter performance is very remarkable. Dixon's machine was fitted with a Sturmey hub gear, and it demonstrates very forcibly that, given intelligent handling, the 3½ powered machine is capable of anything in reason for touring. The surface of the hill was bad, being deep in a thick sandy covering, making the cornering difficult. L. A. Baddeley (3½ P. and M.) and H. F. Edwards (6 Enfield) also exceeded 18 m.p.h. The slowest clean ascent was that of D. W. Popplewell (3½ Triumph), who climbed at a mean speed of 13.01 m.p.h., and as this, in itself, is an admirable performance, it shows how wonderfully the other machines negotiated this severe ascent.

Sidecars versus Cycle Cars.

Three sidecar combinations and one cycle car competed. Of these one of the sidecars failed to get up inside the limit, but the other two, both 5-6 Clynos, had a rare tussle with the 10 Singer cycle car for supremacy. Honours just went to the Singer, driven by Lionel Martin, whose average speed was 14.67 m.p.h., against 14.64 m.p.h. by R. C. Davis on the Clyno, while H. G. R. Slingo, also on a Clyno, averaged 13.67.

It would, therefore, appear that for severe climbing the best sidecars and cycle cars have little to choose between them if well driven, but their speeds were materially bettered by a couple of Douglases, ridden by S. G. Frost and E. Kickham, who averaged respectively 15.78 and 15.20 m.p.h., a really splendid feat. Probably the handiness of these little machines on the bad corners had something to do with their success, though good driving probably played its part, as two others in the 350 c.c. class failed to ascend at the required average speed. But taken as a whole the various performances show that all classes from 350 c.c. to 1,100 c.c. provide adequate touring mounts of the go-anywhere order.

MM. Guilloreau and Gabriel (Clements) two of the French International team in the Six Days' Trials, accompanied by Greame Fenton and A. J. Sproston. The third team member is Bourbeau (Bedelia).

The winning Woolwich, Plumstead and District M.C.C. Team in the Brooklands M.C. Inter-club team trial. From left to right they are: J. W. Wood Enfield sidecar), R. E. Guest (8 h.p. Matchless sidecar), H. A. Collier (3½ h.p. Matchless), C. R. Collier (8 h.p. Matchless sidecar), T. J. Ross (3½ h.p. Triumph) and G. D Hardee (3½ h.p Triumph).

SPEED JUDGING COMPETITION.

The Woolwich, Plumstead and District M.C.C. recently held a reliability and speed judging test to Hythe and back to Ruxley. Result:

		error
1.	F. I. Ellis (3½ Matchless)	16s.
2.	J. W. Wood (Enfield sc.)	22s.
3.	S. W. Gibson (Enfield)	121s.

THE FRENCH TEAM IN THE INTERNATIONAL TRIAL.

On Monday afternoon last Messrs. Greame Fenton, Gabriel, and Guilloreau arrived at 3.25 at Charing Cross, together with their Clément Gladiator machines, and were welcomed on arrival by a representative of *The Motor Cycle*. They spent the night in London, and then proceeded to Carlisle by train on Tuesday to explore the country and get an idea of the English gradients. Neither Gabriel nor Guilloreau has been in England before, so they will be entirely new to the conditions prevailing over here. Fenton is, unfortunately, unable to ride, as in the recent race at Le Mans he met with a rather serious accident, dislocating his shoulder, knocking out a tooth, and sustaining serious bruises. Sproston is therefore riding in his place. Bourbeau, who is riding a Bedelia, did not arrive with the party. The Clément Gladiator machines are practically the same as those entered in the Paris-Nice Trial. They are finished in French grey and fitted with M.A.G. engines, and outwardly strongly resemble the Motosacoche. The machine Guilloreau is riding is a twin of 350 c.c., but Gabriel's mount has a larger engine, bore and stroke 64×77=498 c.c. Two-speed counter-shaft gears and chain drive are standard features. The performances of the belt-driven Bedelia will be watched with particular interest on such a severe course.

IMPORTS AND EXPORTS OF MOTOR CYCLES.

The British imports and exports of motor cycles and parts are still on the increase and show a vast difference from the amount for the corresponding periods of 1912. We quote figures culled from the latest Board of Trade returns for the month of July :

IMPORTS.
For month ended July 31st.

	1911.	1912.	1913.
Motor Cycles	£2,971	£4,857	£2,640
Parts thereof	7,267	13,444	16,204
Total	£10,238	£18,301	£18,844

BRITISH EXPORTS.
For month ended July 31st.

	1911.	1912.	1913.
Motor Cycles	£24,411	£43,148	£71,287
Parts thereof	5,249	13,051	23,737
Total	£29,660	£56,199	£95,024

The exports for the seven months ended July 31st totalled £165,646.

A SPECIMEN A.C.U. SIX DAYS' TRIAL TEST HILL, INCLUDED IN TUESDAY'S ROUTE.
It has a double hairpin, long stretches of loose stones, and gates. A photographer who went to investigate on his 8 h.p. Matchless sidecar, has returned most impressed with the severity of the test hills.

NEXT WEEK'S A.C.U. TRIALS.

Complete List of Entries with Official Numbers. The Main Features.

NEXT week the roads of Lakeland will be alive with motor cycles, for the annual A.C.U. Six Days' (or rather five days) Trials will take place in that district, with Carlisle as a centre. There will probably be not short of 160 actually competing.

The official maps and routes were published in our issue of July 31st last, also the contour sections of the roads, from which it would be seen that the hill-climbing tests set the riders will form the chief feature of the trial. But, although the gradients selected are undoubtedly severe, and many of the corners acute, the surfaces are, in the main, good, and provided the machines are up to the mark and sensibly ridden, there ought not to be any very great difficulty in surmounting all the numerous test hills.

An innovation has been introduced this year in the shape of the flexibility test, and in addition to this a speed trial will be held over a kilometre at Underley Hall, Kirkby Lonsdale, on Friday, a flying start being allowed.

The introduction of a flexibility test is, perhaps, the most interesting innovation by the A.C.U. for some time, and is undoubtedly a step in the right direction. We deal with this matter in our leaderette this week.

Suffice it to say here that the test will take place up a gradient averaging one in ten 250 yards in length, the first fifty yards being a slow and the last 200 yards a fast run. 7.2 m.p.h. maximum and 5 m.p.h. minimum are set for the slow test, and 18 m.p.h. minimum and 20 m.p.h. maximum for the fast part of the run. Nothing is to be gained by slower or faster running respectively. We feel sure that an immense amount of interest will be aroused by these tests, especially by the slow portion. No stopping the engine or leg assistance will be permitted.

The general running conditions are strict and a very close adherence to schedule will be necessary to qualify for a gold medal. We published last week a full list of penalties and marks to be lost through incurring them. An interesting point to be noticed is the penalising by one mark each day of any excessively dirty or untidy machine or driver. Here again we think the A.C.U. is acting wisely and in the best interests of the pastime. One last word; competitors and all others attending the trials are particularly requested to drive with the utmost consideration through Carlisle each morning and night.

DIVISION 1.—MOTOR BICYCLES.

Class B.—350 c.c.

1. C. Percival (2¾ Douglas).
2. Jas. B. Sproston (2¾ Sunbeam).
3. A. G. Cocks (2¼ Connaught).
4. P. Phillips (2¾ Douglas).
5. F. G. Edmond (2¾ Humber).
6. E. Gutgemann (2¾ Veloce).
7. T. C. de la Hay (2¾ Sunbeam).
8. W. R. Steel (2¾ Sunbeam).
9. F. G. Ball (2¾ Douglas).
10. Tom Knowles (2¾ Humber).
11. F. L. Bassett (2¾ Sun-Villiers).
12. Albert Milner (2¾ Levis).
13. Howard Newey (2¾ Levis).
14. P. W. Moffat (2¾ Douglas).
15. W. B. Gibb (2¾ Douglas).
16. M. Guilloreau (2¾ Clément).
17. A. J. Sproston (3½ Clément).

Class C.—500 c.c.

18. W. J. M. Sproulle (3½ P. & M.)
19. G. D. Hardee (3½ Triumph).
20. T. J. Ross (3½ Triumph).
21. Fred Dover (3½ Premier).
22. J. H. Kerr (3½ N.S.U.)
23. Albert E. Catt (3½ Triumph).
24. S. Sawer (3½ Premier).
25. F. W. Applebee (3½ B.S.A.)
26. W. C. Drake (3½ P. & M.)
27. P. Shaw (3½ P. & M.)
28. Harry Moore (3½ P. & M.)
29. Maurice C. Breese (3½ B.S.A.)
30. F. E. J. Bartlett (4-5 Endurance)
31. C. B. Moss-Blundell (3½ Green-Precision).
32. H. V. Colver (3 Enfield).
33. E. Keyte (3 Enfield).
34. H. Graham Dixon (3½ James).
35. J. Ingham (3½ Veloce).
36. S. Tubb (3½ Humber).
37. T. B. G. Vale (3½ Rover).
38. G. E. Cuffe (3½ Premier).
39. W. E. Cooke (3½ A.S.L.)
40. S. Browne (3½ James).
41. Ellison Hawkes (3½ Rudge).
42. F. C. North (3½ Ariel).
43. J. M. Ritchie (3½ Rudge).
44. Herbert Bali (3½ Triumph).
45. J. Oliphant (3½ Premier).
46. J. S. Holroyd (3½ Motosacoche).
47. W. B. Little (3½ Premier).
48. C. Q. Roberts (3½ Blackburn).
49. W. H. Longton (3½ Alldays)
50. H. F. Edwards (3½ B.S.A.)
51. L. Newey (3½ Ariel).
52. K. A. Macdonald (3½ Singer).
53. W. Maurice Greenwood (3½ New Imperial).
54. H. Taylor, jun. (3½ B.S.A.)
55. A. C. F. Andrews (3½ Ariel).
56. Vernon Busby (3½ Ariel).
57. R. S. Scoon (3 N.U.T.)
58. G. E. Keel (3 N.U.T.)
59. James Robinson (3 N.U.T.)
60. J. Hoult (3½ Matchless).
61. H. Berwick (3½ Hampton).
62. T. B. Westmorland (3½ Premier).
63. H. C. Mills (3½ Zenith-Green).
64. Sydney J. Hine (3½ Humber).
65. D. M. Brown (3½ Rover).
66. G. J. Francis (3½ Lea-Francis).
67. Norman Lea (3½ Lea-Francis).
68. L. Sealey (3½ B.S.A.)
69. A. G. Fenn (3½ B.S.A.)
70. D. H. Noble (3½ Rover).
71. G. Featherstonhaugh (3½ Rover)
72. C. T. Newsome (3½ Rover).
73. T. Pollock (3½ James).
74. C. Lester (3½ P. & M.)
75. M. Gabriel (3½ Clément).
76. Rex G. Mundy (3½ Triumph).
77. G. J. Shemans (3½ Triumph).
78. W. Westwood (3½ Triumph).
79. C. E. Murphy (3½ Triumph).
80. A. W. Walden (3½ Premier).

Class D.—750 c.c.

81. J. A. Neumann (5-6 Rudge).
82. Ian P. Macdonald (4½ Norton).
83. G. T. Gray (5-6 Rudge).
84. H. W. Teeton (3½ James).
85. H. E. Ashley (4 L.M.C.)
86. Dan Bradbury (4 Norton).
87. Ray. Drinkall (4½ Quadrant).
88. J. J. Day (3½ Bradbury).
89. Gordon Castognoli (4 L.M.C.)
90. L. A. Bees (4 L.M.C.)
91. Fred W. Roberts (5-6 Rudge).
92. H. Blamire (5-6 Hazlewood).
93. F. H. May (5 A.J.S.)
94. A. W. Brittain (3½ Bradbury).
95. G. W. Braithwaite (5-6 Rudge).
96. P. Platt (3½ Bradbury).
97. H. E. Haswell (3½ Bradbury).
98. George Hunt (5-6 Campion).
99. H. J. Beal (4 L.M.C.)
100. J. Richard (4½ Sun-Precision).
101. J. D. Drysdale (5-6 Hazlewood).
102. A. T. Stanton (3½ Bradbury).

Class E.—1,000 c.c.

103. J. Douglas Morrison (5-6 Bat).
104. H. H. Hutchinson (6 Trump).
105. E. A. Colliver (7 Indian).
106. B. Alan Hill (7 Indian).
107. S. T. Tessier (5-6 Bat).
108. J. R. Alexander, jun. (7 Indian).
109. G. A. Gregson (6 Bat).
110. J. V. Edge (6 Brough).
111. A. Sumner (8 Zenith).
112. J. Haslam (6 Zenith).
113. H. Jepson (8 Zenith).
114. C. W. Smith (5-6 Bat).
115. Reay S. Morrison (5-6 Bat).
116. R. E. Townshend (6 Trump).
117. E. H. Lees (8 Zenith).
118. M. Hands (8 Williamson).

DIVISION 2.—SIDECAR COMBINATIONS OR 3-WHEELED CYCLE CARS.

Class G.—500 c.c.

119. H. C. Marston (3½ Triumph).

Class H.—750 c.c.

120. Jesse Baker (3¾ Scott).
121. Hugh Gibson (3½ Bradbury).
122. A. J. Stevens (6 A.J.S.)
123. D. Bell (6 A.J.S.)
124. F. A. Applebee (3¾ Scott).
125. J. Norman Longfield (3¾ Scott).
126. R. C. Davis (5-6 Clyno).
127. Philip Grout (6 A.J.S.)
128. Thomas Stevens (3½ James).
129. Cecil Duplock (6 A.J.S.)
130. Rex Pearson (5-6 Clyno).
131. Claude Freeman (5-6 Clyno).
132. J. A. Poxon (3½ Bradbury).
133. George Wray (5-6 Clyno).
134. George Nott (5-6 Clyno).
135. A. D. Arter (4½ James).

Class I.—1,000 c.c.

136. C. H. R. Norrington (6 Enfield).
137. H. Greaves (6 Enfield).
138. W. H. Eggington (6 Enfield).
139. Fred Crostwaite (8 Matchless).
140. J. Chater-Lea, jun. (8 Chater-Lea).
141. E. B. Glisson (8 Wall tricar).
142. Denis Buckley (8 Matchless-Precision).
143. Fred Turvey, jun. (6 Enfield).
144. Victor Garland (8 Chater-Lea).
145. T. Silver (7 Quadrant).
146. W. Land Dibb (6 Rex).
147. C. R. Collier (7-8 Matchless).
148. R. E. Guest (7-8 Matchless).
149. T. Rutherford (7-8 Matchless).
150. H. F. S. Morgan (8 Morgan).
151. Doug. Alexander (8 Williamson)
152. J. B. Blackbourn (8 Morgan).
153. R. A. Rhodes (6 Wulfruna).

DIVISION 3.—CYCLE CARS.

Class K.—1,100 c.c.

154. F. K. Portway (9 Paragon).
155. P. D. Walker (10 Harding and Summers).
156. C. M. Keiller (8 G.W.K.)
157. W. Chater-Lea (8 Chater-Lea).
158. Alan T. Tamplin (8 G.W.K.)
159. Lionel Martin (10 Singer).
160. E. B. Slater (8 J.B.S.)
161. R. Bourbeau (8 Bedelia).
162. W. Cooper (8 Humberette).

The Leaders.

The starting order in the Six Days' Trials will be varied as last year, so that those who finish late on the first day will be much earlier on succeeding days. The leaders on the five trials days fall as follows:

Monday: 116, R. E. Townshend (6 Trump-Jap).
Tuesday: 42, F. C. North (3½ Ariel).
Wednesday: 45, J. Oliphant (3½ Premier).
Thursday: 5, F. G. Edmond (2¾ Humber).
Friday: 50, H. F. Edwards (3½ B.S.A.)

The start is at 8.0 a.m. each morning, except Friday, when the start is timed for 7.0 a.m.

The International Teams.

In the International Trial France's colour is blue and the British team green.

The details of the machines are as under:

No.			mm.		c.c.
	Great Britain.				
15.	W. B. Gibb (2¾ Douglas) ...	...	60.8	× 60	349
47.	W. B. Little (3½ Premier) ...	...	85	× 88	499
147.	C. R. Collier (8 Matchless sc.)	...	85	× 85	964
	France.				
16.	M. Guilloreau (2¾ Clément-Gladiator)		54	× 75	350
75.	M. Gabriel (4 Clément-Gladiator) ...		64	× 77	498
161.	M. Bourbeau (8 Bedelia c.c.)	...	82	× 100	1,100

THE ROUTES FOR THE SIX DAYS' TRIALS.

MONDAY (124 miles). — Carlisle, Cotehill, Armathwaite, Kirkoswald, Lazonby, Penrith, Ullswater (North), Watermillock, Matterdale, Ullswater, Patterdale, Kirkstone Pass, Ambleside, Foolstep Hill, Red Bank, Dunmail Raise, Whitburn, Thirlmere, Keswick (lunch), Braithwaite, Whinlatter Pass, Low Lorton, Whinfell, Loweswater, Crummock Water, Buttermere Hause, Newlands, Stair, Gutherscales Hill, Grange, Derwent Water, Keswick, Bassenthwaite, Uldale, Aughertree Fell, Dalston, and Carlisle.

TUESDAY (164 miles). — Upperby, Southwaite, Calthwaite, Penrith, King's Meaburn, Crosby Ravensworth, Orton, Grayrigg, Kendal, Dent, White Shaw Moss, Ingleton (lunch), Newby Head, Hawes, Butter Tubs Pass, Keld, Stonesdale Hill, Tan Hill Inn, Brough, Appleby, Long Marton, Skirwith, Glassonby, Kirkoswald, Gumwhitton, and Warwick.

WEDNESDAY (147 miles).—Dalston, Warnell Fell, Caldbeck, Hesket Newmarket, Mungrisdale, Wythburn, Dunmail Raise, Grasmere, Red Bank, Skelwith Br., Coniston, Blawith, Lowick, Kirkby Moor, Ulverston (lunch), Higher Lath, Grizebeck, Broughton-in-Furness, Ulpha, Kiln Bank, Broughton-in-Furness, Ulpha, The Seat, Eskdale Gn., Gosforth, Calder Br., Cold Fell, Ennerdale Bridge, Crossdale, Lamplugh, Cockermouth, Bothel, Mealsgate, Red Dial, and Thursby.

THURSDAY (170 miles).—Warwick, Croglin, Renwick, Hartside, Alston, Nenthead, Slate Hill, Wear Head, St. John's Chapel, Westgate, White Edge, Bolts Burn, Stanhope, Horseshoe Hill, Edmundbyers, Lanchester, Witton Gilbert, Durham (lunch), Brancepeth, Tow Law, Wolsingham, Eggleshope, Newbiggin, Grass Hill, Alston, Knarsdale, Hallbank, Gate, Warwick, and detour to Wetheral.

FRIDAY (178 miles).—Carleton, Low Hesket, High Hesket, Plumpton Wall, Penrith, Clifton, Thrimby, Shap, Forest Hall, Kendal, Brigsteer Brow, Natland, Underley Hall (speed trials), Casterton, Kirkby Lonsdale, Lupton, Sampool Bridge, Staveley, Gummer's How, Bowness (lunch), Low Wood Hotel, Skelwith, Hollin Bank, Coniston Water, Oxen Park, Thwaite Head, Devil's Gallop, Satterthwaite, Ambleside, Kirkstone Pass, Patterdale, Ullswater, Dacre Bank, Skelton, and Ivegill.

SOUTH-EASTERN COUNTIES INTER-CLUB TEAM TRIAL.

J. T. Wood (G.W.K.) ascending Cudham Church Hill.

THE South-Eastern Counties' Inter-club Team Trial was held last Saturday, the first man being despatched from the Crown Hotel, Leaves Green, at ten o'clock. The rules stated that any man stopping automatically retired from the trial, and should two or more teams finish with an equal number of men left in, the winning team would be decided on the lunch and finishing time checks.

The route for the greater part of the journey lay through twisty lanes, and included the ascent of Chalk Pit, Polsteeple, Crown Ash (usually called Salt Box), and Cudham Church Hills. There were also several acute hairpin corners which required very careful negotiation. This course had to be covered twice, once in the morning and again after lunch, and it was agreed by all that it was a very tricky route. Three officials went round before the start and posted arrows, but, unfortunately, there is a great deal of ill-feeling towards motor cyclists in this district, and some mischievous persons had removed some of the arrows, which caused a great many of the competitors a lot of trouble to find their way.

About two miles from the start we passed Gibson, who had suffered a puncture. The first hill, Cudham, accounted for Smith on an Enfield and sidecar, who failed to climb it. Chalk Pit Hill was dry, but full of bumps, which made it very awkward to take the bends, and here Henfrey (Ariel) failed on the bottom corner, while just before reaching this hill Meredith (Bradbury sidecar) had the misfortune to break his belt. Polsteeple was climbed easily by all.

Crown Ash was undoubtedly the worst hill of the day, it being in a very bad condition, and the gradient is quite severe enough at the best of times, but in addition to this it was covered with loose stones. However, on the whole, the performances were quite good, although Belsham's 3½ Rudge-Multi emitted some ominous konks. Sydenham (Clyno) met his Waterloo, while Graham Price managed to reach the top when his belt broke, truly hard luck. Some very good performances were put up on Cudham Church Hill, amongst these being Hardee, Collier, and Mundy. The next hill of any note was Hog Trough, where most of the competitors performed admirably. About here Breeze (B.S.A.) punctured and Taylor (2½ A.J.S.), who stopped his engine going downhill with no clutch out, was unable to get it to fire again in time before reaching a bad corner.

Twisty lanes brought us to the start again; but many went wrong about one mile out owing to a missing arrow. After lunch the men were started on their second circuit, and Willoughby retired. Only Charlesworth and he were left in the Purley team, and up to this point they had both made non-stop runs. Charlesworth, who was riding his Zenith with M.A.G. engine, as in the Anglo-Dutch trials, decided to withdraw, and Mitchell, who had had the word to start and had gone only a few yards when his tyre went flat. Belsham, although managing to make a clean ascent in the morning, failed on the bottom bend of Chalk Pit in the afternoon. Wood (Enfield sc.) had to stop on Cudham Church Hill to clean a plug, and Meeten (3½ Rudge) was reported for footslogging on the bottom corner of Crown Ash, but was allowed to claim a non-stop. Edwards was put out by trouble with his hub gear, and C. Collier, who punctured a few miles out, retired. Harry Collier was riding a 3½ twin Matchless with chain drive to the counter-shaft and thence a belt to an Armstrong hub gear, and was only slowed by Crown Ash. Mitchell stopped about fifty yards from the finish trying to run slowly, as he was too early. A few miles from the finish was a hairpin corner, and to prove how acute this was, Wood had to reverse on both rounds with his G.W.K.

A word must be said for the big twin Premier handled by Oliphant, for this machine climbed in splendid style, although the driver told us that he found it necessary to keep his engine turning round fairly fast.

Officials Astray.

A. G. Reynolds was on the programme as timekeeper, but we were informed that the A.C.U. had in some way failed to communicate with him, and so Mr. F. J. Ellis, of the Woolwich Club, had to undertake his duties. The Rev. E. P. Greenhill, the A.C.U. representative, arrived rather late in the afternoon, this time on a three-speed James. The result was that the Woolwich Club beat the Brookdale Club by 1m. 24⅘s., both with four finishers, the Surrey Club being third with three finishers, and the Streatham Club fourth. The Purley Club had none to finish.

We must congratulate the officials on the smart way in which they announced the results, H. A. Cooper in particular being responsible for some very hard work. The following made non-stops :

WOOLWICH CLUB.

G. D. Hardee (3½ Triumph)	H. A. Collier (3½ Matchless)
R. E. Guest (8 Matchless sc.)	T. J. Ross (3½ Triumph)

BROOKDALE CLUB.

J. O. Oliphant (8 Premier sc.)	E. H. Fuller (3½ Premier)
J. D. Drysdale (6 Hazlewood)	W. F. Guiver (3½ Ariel)

SURREY CLUB.

J. T. Wood (G.W.K. c.c.)	T. Meeten (3½ Rudge)
H. Crow (3½ Ariel)	

STREATHAM CLUB.

J. Bateson (2¾ Douglas)	Rex G. Mundy (3½ Triumph).
W. L. Barratt (2¾ Douglas)	

The members of the winning team to make non-stop runs will each receive a gold medal

Coupe Internationale des Motocyclettes, Circuit de la Sarthe.

DAMAGED TYRES

The "Correct" Treatment.

YOU, as a motor cyclist, will appreciate the advantage of always carrying a Simms Universal Vulcanizer when awheel, as by its aid you can repair, quite as well as the most experienced tyre-maker, any damaged cover or tube. All you have to do is to apply

SIMMS UNIVERSAL VULCANIZER

to the cut, puncture, or burst, light up and wait. In 15 minutes the cover or tube is restored to health, sound in every way, as good as new. The cost per repair is but *one penny*. Ask your dealer to show you this little device, or call and see it demonstrated.

Price complete, ready for instant use, 19/6

Car Practice Applied to Motor Cycles.

THE two-cylinder engine produced by the Triumph Co., which we illustrated last week, is interesting inasmuch as it marks a distinct step towards merging the design of power units of cars and motor cycles into closer harmony. Some few years ago cars were notoriously a jumble in the way the necessary component parts were assembled, but gradually out of disorder has come compactness, and now the best practice affords a neat unit-giving engine, clutch and gear box in one compact whole. It is now universally acknowledged that a change-speed device giving preferably, at least, three speeds should be employed, and what could be better, lighter, or stronger than that the engine base chamber and gear box should be in one piece, so arranged that the whole can be removed bodily from the frame by the removal of two or three bolts at the most.

The final drive could be arranged either by shaft, chain, or belt, and the accessibility of the back wheel would be unimpaired. Weight would be centred at the point where it is most wanted, and cleaning would be enormously simplified. Already engines are on the market with the gear box integral with the engine, and they are giving satisfaction. The difficulties in evolving a successful design are not enormous, and if it were possible to lift out the unit containing engine, gears, clutch, magneto, and carburetter, and transfer it to the bench, overhauls and adjustments would become a matter of ease, and reassembling an operation of absolute simplicity. This desideratum has been reached in quite inexpensive cars—we believe it to be only a question of time before the ingenious designer applies the same skill to the design of motor cycles.

PEERLESS CYCLE CAR MODELS.

A few days ago we paid a visit to the works of Peerless Motors, Ltd., Bradford Street, Birmingham, and inspected a very neat little single-seated cycle car fitted with a 3½ h.p. Green water-cooled engine with water tank and petrol reservoir placed under the scuttle dash. The Green water-cooling system being embodied with the cylinder the bonnet of this little car is pointed in shape, and provided with openings through which the air can reach the radiators of the cylinder.

This firm has taken over the Rollo designs, and is now occupied in turning out a water-cooled model under the title of the Peerless. An 8 h.p. water-cooled engine is employed, this being placed under a taper bonnet with pointed radiator.

The Peerless Co. are also at work on an entirely new model cycle car which will be ready for exhibition at Olympia. The engine and gear box will form one unit, two speeds and reverse being fitted, while the transmission will be by propeller-shaft and differential.

SCENES IN THE BROOKDALE M.C. SOUTH EASTERN COUNTIES INTER-CLUB TEAM TRIAL.

ON THE TRACK OF THE TRIALS.

The Adventures of a Novice in the Scottish Highlands.

MUCH has been written about the Scottish Six Days' Trials, but possibly the experiences of an absolute novice during that very strenuous and exciting week in the Highlands may prove of interest.

Originally my intention had been to cover the route as the passenger in a competing sidecar, but circumstances arose which made it imperative that I should go round on my own. My experience of motor cycling was limited, and before the trial I had covered at the most only 200 miles on a petrol-driven machine. Thus the prospect of tackling a thousand miles in one week over the most severe road in the land o'cakes did not appear too alluring, and caused many a qualm of uneasiness before even the start from the fair city of Perth. The sympathetic remarks of my friends were also not calculated to elevate my somewhat low spirits, and judging by their concern regarding my welfare, the majority had visions of my early return to the city on the Clyde—if I returned at all—*via* one of the many luxurious express trains from the North. "Nothing venture nothing win," however, is particularly applicable to all sports, and especially so in relation to motor cycling, and loaded with as little luggage as possible on the carrier, my camera on my back, and tons and tons of advice, I started upon the most memorable week which it has been my luck to experience.

A few words as to my mount will not be amiss. This was a 1913 3½ h.p. Rover, fitted with Armstrong three-speed gear, which had covered about 500 miles before it came into my hands. As a special precaution against tyre trouble, I fitted a pair of Bates special heavy 2½in. tyres and tubes, and it may be stated here that, with the exception of one small puncture repaired in the garage in Edinburgh at the conclusion of the trial, they caused me no trouble from start to finish. Undoubtedly a splendid tribute to their wearing and puncture-resisting qualities.

Wriggling Up Amulree.

Amulree was my objective on the first day, and the famous hill was reached without trouble. Like a good many one-time test hills it does not now possess the terror it once did, and although one or two very strained expressions were seen during its ascent, the majority of the competitors rounded its hairpins with an abandon and sangfroid which would have been entirely absent a few years ago. My own ascent I will never forget, and neither will the spectators who derived so much amusement from my tortuous efforts. The first hairpin was rounded quite easily, and so was the second. Then the fun began. With a violent wobble of the front wheel I charged first the right bank, then swung across to the left, then back to the right, finally finishing with a straight dash up the hill. Despite my antics, however, I climbed the hill on my first attempt, without coming off, and was pardonably pleased at my success. As if to cure me of my pride, however, I had not proceeded far on the road to Kenmore when in crossing some loose surface I parted company with the machine, incidentally losing my left pedal.

My Second Spill.

Nothing further happened until the long climb up the Spital of Glenshee, which culminates in the bends of the Devil's Elbow. Too much oil was the trouble, the plug sooting up. Here occurred my second fall, the loose sand on the second bend bringing me to earth, greatly to the delight of a few personal friends on the hill. Like good sportsmen, though, they assisted to set things aright, and with their best wishes I went on for Braemar, where I arrived without further mishap.

Lunch fortified me for the journey over the "worst road in Scotland," and after an uneventful trip I arrived in Inverness with the last of the competitors. The afternoon's itinerary did not appeal to me as being as severe as it was painted, and were it not for the atrocious surface, the majority of the hills would be easily climbable. The bracing air and the unaccustomed mode of travelling made me feel rather fatigued, and it was with a feeling of relief that I threaded my way through the narrow streets of the northern capital, having covered more miles in one day than I had previously done altogether.

Looking back in calmer reflection upon this first day, no incident stands out pre-eminently, and if any one thought remains in my memory more than another, it is of the execrable road surface. In many places the trip resembled an obstacle race, the loose metal being strewn all over the so-called roads. Of the magnificent scenery through which we passed I saw little. My whole time was occupied in keeping watch over the front wheel and preventing its many tendencies to go off on its own.

Days Too Long and Nights Too Short.

The few hours abed on the Monday evening were all too short, and the following morning found me disinclined to start, and, in common with a few fellow spirits, wishing the Trials anywhere. I really think an event of this type should be one day trial and one day rest. Perhaps the officials will make a note of this suggestion for future occasions!

In a week such as this one day is very apt to resemble another, hence we have rough roads and hills or hills and rough roads. Of one thing we can be

On the Track of the Trials.

certain, and that is that good surfaces are uncommon in Scotland. If asked to give my opinion as to the worst, I should plump for the stretch between Tongue and Melvich. I know that not many of the competitors will agree with me, but I have vivid recollections of the journey to Thurso, and shall never forget the sigh of relief which I heaved on coming to the last twelve miles of road into this town, which is really excellent.

Wednesday was the most enjoyable day of all, a glorious "blind" from beginning to end. With the machine going splendidly, the road excellent, and the scenery magnificent, what more could one want? No wonder a feeling of exhilaration coursed through my veins. The mighty billows of the North Sea dashing upon the rocky coast of Caithness was a picture worthy the brush of an artist, and I was tempted to linger with the camera and obtain views of the seething foam. But this was no time to tarry, and, with the smell of the sea in my nostrils, the call was On! On! On! The charms of the panorama of loveliness through which I passed were, however, not lost. On the left, as far as the eye could see, stretched the wind swept ocean. On the right, the undulating moors vanished in the haze, out of which the rugged Sutherland peaks towered like sentinels guarding the lands beyond.

The North-west Highlands.

Strathpeffer, the spa of the Highlands, beautifully situated in a hollow in the hills, was a delightful stopping place after so glorious a day. The journeys to the West, Applecross, Mam Ratachan, Glenelg, and Glendoe, were again a test of tyres and frames. With Applecross, I confess to being a little disappointed. Were it not for the bad surface, there would be no difficulty in the climb, and the same holds good regarding Mam Ratachan. The chief difficulty of the hills lies in their length and the test of overheating. From the scenic standpoint, both are magnificent; the views from the summits stretching for miles in a panorama of hill and loch.

A Word for the Machine.

So much for the Thursday and Friday. The last day very much resembled the first, and a recital of the various hills and road surfaces covered, would serve no useful purpose. Edinburgh was reached in the evening without mishap, and so finished a week brimful of incident.

From start to finish the Rover had done splendidly, and, even in my novice hands, the only trouble was a sooting of the plug, due, as before mentioned, to over oiling. With the exception that I opened my toolbag for the purpose of removing the plug, I never required a spanner for anything else. The engine possessed plenty of power and climbed all the hills encountered quite easily. As to the Armstrong gear, this was only adjusted twice during the week, and never failed on any gradient. At the time when we hear so much about the failure of hub gears, I would like to state my absolute freedom from trouble during this strenuous week, which should go to prove the reliability of this type of gear.

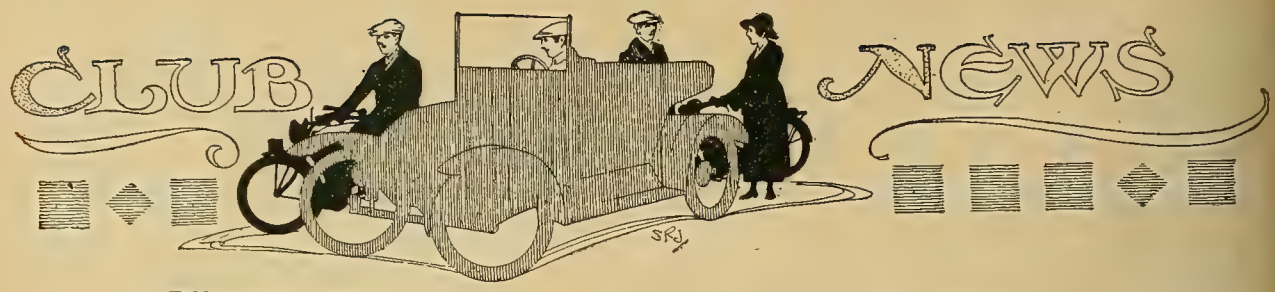
J.L.G.

A REMARKABLE RUN.

Round Scotland on a Single Gear.

IN these days, when nearly everyone considers two or three speeds essential fitments to a motor cycle, it is remarkable to find anyone with the temerity to take a single-geared machine through a six days' trial, and when the trial selected was the late Scottish Six Days, it is a really wonderful performance to carry out. George Brough, mounted on a 6 h.p. twin Brough of his own manufacture, has performed this feat, and as the route of the Scottish trials fell twenty miles short of the round thousand, he asked us to accompany him a further twenty miles to complete that distance. Brough believes in moderate weight and plenty of power, and he quite eschews low gears. By far the greater portion of the run was accomplished on a 3⅞ to 1 gear ratio; only on Amulree, Applecross, and Kenmore did he fit a smaller section belt which gave him a ratio of 4½ to 1. Anyone who has had experience of these roads will appreciate Brough's performance to the full, for even allowing for great skill in the handling of the machine, it requires an engine of remarkable flexibility and suppleness to tackle these acute Scotch hairpins on any gear of a single figure ratio. While applauding the skill of the rider and the excellence of his motor, it must not be imagined that we look with favour on the single-geared machine for touring. We do not, nor do we suppose does Brough, but he set out to prove that he can build a twin engine capable of extraordinary performance, and in that he amply succeeded. Fitted with a change-speed device, such a machine as this should be capable of taking a sidecar and full load anywhere under any conditions, while the moderate compression employed renders it a most comfortable mount to ride.

George Brough of Nottingham, and the 6 h.p. Brough which he rode through the recent Scottish Six Days' Trial on a single gear.



Tyldesley and District M.C.C.

The annual reliability trial was concluded on Bank Holiday. The course was *via* Leigh, Dinas Mawddwy, Aberystwith, Newtown, Knighton, and Tarporley. Result:

1. A. Peters (3½ Triumph)
2. A. Hobson (3½ B.S.A.)
3. C. Newton (3½ B.S.A.)

Aberavon, Port Talbot and District M.C.C.

The following are the results of the reliability trials held on the 3rd and 4th inst. to Aberystwith and back: Winner of the Deere Challenge Cup and gold medal, G. Clarke (3½ Zenith), 3m. error; 2, F. Abbott (3½ James), 4m. error. Gold medals: G. Clarke, T. Evans, F. Abbott, H. Davies, and L. Davies. Silver medals: J. Davies and B. Wheeler.

The Public Schools M.C.

Two runs will be held, starting from Birmingham, to give members an opportunity of meeting one another. The first run will start from the Grand Hotel at 2 p.m. on Saturday, August 16th, for Llangollen, *viâ* Wellington, Shrewsbury, Chirk, to put up at the Hand Hotel, Llangollen. The second run will take place on Saturday, August 30th, starting from the Grand Hotel, Birmingham, at 2 p.m., for Henley-on-Thames, *viâ* Stratford-on-Avon, Shipton, and Oxford, and putting up at the Lion at Henley.

Liverpool Amateur M.C.C.

A 140 miles reliability trial was held in North Wales on August Bank Holiday. The course was a fairly stiff one, and eliminated a number of the competitors. The following are the winners in the order named: 1, C. Stuart Ashcroft (Rudge-multi); 2, E. V. Taylor (Bradbury); 3, W. D. Williams, jun. (Douglas); 4, J. Wood (Clyno).

The committee have now issued the result of the hill-climb recently held at Halkyn Mountain: 1, George Flinn (6 Brough); 2, W. D. Williams, jun. (Douglas); 3, C. H. Dalmer (6 Royal Enfield).

Finsbury Park C.C. (Motor Cycle Section).

A flexibility test, consisting of fast and slow hill climbs was held on the 4th inst. near Pangbourne. The same gear had to be used for both climbs and the machines could not be altered in any way, so that the results depended entirely on the real flexibility of the engine and the riders' skill. The hill was threequarters of a mile long, having an average gradient of about 1 in 8 with two corners.

The Motor Cycle formulæ were used, $\frac{1{,}000\ W}{C \times T^2}$ for the fast, and $\frac{W \times T}{1{,}000\ C}$ for the slow, the results being as follows:

FAST.

1.	C. F. Revelle (3½ B.S.A.)	.186
2.	C. W. Cooke (3½ Triumph)	.174
3.	R. Gordon Barrett (3½ Motosacoche) ...	.166
*4.	J. Evans (5-6 Bat)	.164

*Fastest time.

SLOW.

1.	R. Gordon Barrett (3½ Motosacoche) ...	.229
2.	C. W Cooke (3½ Triumph)	.153
3.	J. Evans (5-6 Bat)	.122

The Touche Challenge Cup and gold medal is presented this year to the member gaining the best aggregate in all competitions held by the club, of which the above were the first two this season, and the resultant score to date is as follows:

1.	R. Gordon Barrett (Motosacoche) ...	.395
2.	C. W. Cooke (Triumph)	.327
3.	J. Evans (Bat)	.286

Cape Peninsula M.C.C.

A novices' flexibility hill-climb was recently held near Camps Bay. In the fast climb C. Baard (3½ Triumph), reaching the hairpin bend, misjudged his speed, mounted the bank with both wheels, but got back to the road and continued his ascent. Results: 1, C. Baard (3½ Triumph); 2, M. N. Clarke (4 James); 3, T. Grady (3½ Triumph).

Maesteg and District M.C.C.

A slow hill-climb took place on the 30th ult. Results:

Class I.—Single-geared machines: 1, G. Thomas (4 J.A.P.); 2, H. Tamblyn (3½ Triumph).

Class II.—Variable gears: 1, W. Thomas (2¾ Douglas); 2, W. John (3½ Bradbury).

Class III.—Sidecars and cycle cars: 1, W. Thomas (2¾ Douglas); 2, H. Anderson (3½ Premier).

Class IV.—Open: 1, W. Thomas (2¾ Douglas); 2, W. John (3½ Bradbury).

Ballymena M.U.

A hill-climb was held at Roguery Hill on the 6th inst. *The Motor Cycle* formula was used. Results:

CLASS II., 500 c.c. and upwards.—1, W. Cameron (Triumph); 2, D. Hanter (B.S.A.).

CLASS III., Sidecar.—1, J. Stewart (Douglas); 2, W. Cameron (Triumph).

The Ladies' M.C.C.

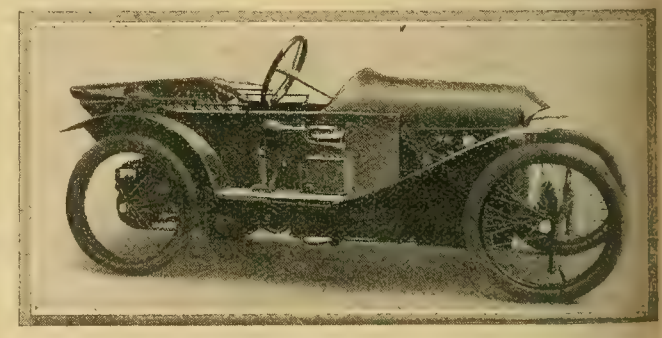
It is proposed to form a motor cycle club for ladies only—motor cyclists and drivers of cycle cars. Men will not be barred from all competitions; on the contrary, they will be welcome to take part in some of the events. The headquarters of the club will be in London, and the trials held will be within easy distance of the Metropolis. Those interested should write Miss Mary Ellis, 35, Portland Place, London, W.

Westmorland M.C.C.

A two days' reliability trial was run off on the 3rd and 4th insts. for Mr. S. Watson Weatherburn's challenge bowl. Route: Mint Bridge, Kendal, Shap Fell, Carlisle, Lockerbie, Crawford, Stirling, and Dunfermline to Dysart, in Fifeshire, the home of Mr. Watson Weatherburn, who entertained the competitors on their arrival. The return journey was made by Queensferry, Edinburgh, Galashiels, Hawick, Carlisle, and Kendal. The total distance travelled by the competitors was about 370 miles. Results:

Solo Machines.—W. Hutchinson (6 Zenith) and W. Westwood (3½ Triumph) tied for first place.

Sidecars.—1, B. Jefferys (8 Zenith); 2, G. W. Braithwaite (5-6 Clyno).



A specimen of an Austrian cycle car which sells for £110.

A "Big Performance" —by a Big Man—

on a BIG BELT!

Messrs. Lycett's,

"The Saddlery," Birmingham.

Dear Sir,

"Just a line to let you know how delighted I am with the new Lycett's "RELIABLE" Belt. Last week I got the following successes all on one Belt, viz:—

N.W. Middlesex M.C.C., 12 hours 200 Miles Trial. NON-STOP and Highest Award, SILVER MEDAL. B.M.C.R.C. Open 6 Hours Race. WON the 750 CLASS.

Herts. County M.C. Half Day Open Trial. Won the 1,000 c.c. Class, and made FASTEST TIME in Speed Trials and Hill Climb.

—and *that* without having to shorten it once. Any gear alteration I got by using different fastener links. The way this Belt grips in wet weather on a powerful Twin is an eye opener."

F. A. McNAB, Golders Green, London, N.W.

"You will no doubt be interested to hear how your belts behaved on my wife's and my own machines in the Scottish Trials, in which we each gained Gold Medal. Well, I put both belts on absolutely new for the Trials, and had not time to run them even a few miles, so naturally on the second day I took about an inch out of each, and thereafter, during the whole Trial, the belts did not give a second's trouble, did not slip or pull through. We were both delighted with their behaviour, and both belts are good for at least another 1,000 miles, which, considering the power of the machines, I consider to be excellent. I do not think it possible to obtain a stronger or more flexible belt than yours."—E. F. BAXTER, 5, Blantyre Road, Sefton Park, Liverpool. July 31st, 1913.

—also note the NORTON successes on Lycett's "RELIABLE" Belt:—

SCOTTISH BORDER M.C.C. OPEN HILL CLIMB, July 12th.

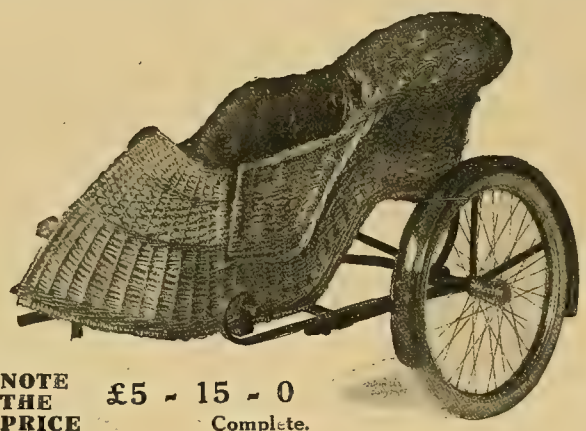
—Mr. Roy MacGibbon on a Norton fitted with "LYSO" won Class 4 (Open), and Class 9 (General)—and made FASTEST single cylinder time of the day!

LYCETT'S, "The Saddlery," Bromley St., Birmingham.

In answering this advertisement it is desirable to mention "The Motor Cycle."

R.H.S C29

BARGAINS IN SIDECARS

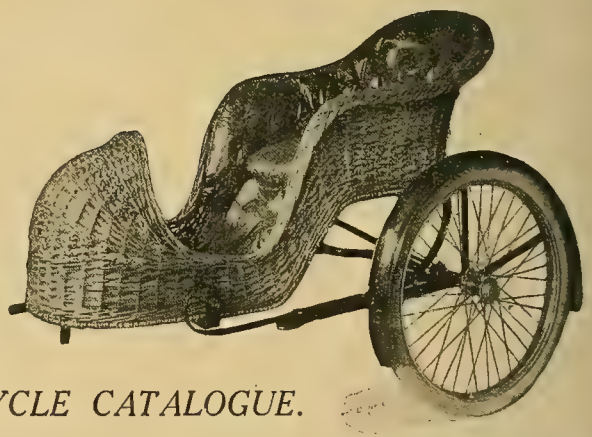


NOTE THE PRICE £5 - 15 - 0 Complete.

Visitors to London, and all motor cycle users, should make a point of calling at Dunhill's Showrooms at 359-361, Euston Road, to inspect the really magnificent selection of Sidecars on view. These Sidecars are splendid examples of the new Autumn models, and are presented in a variety of elegant designs.

Among the Sidecars to be seen at Dunhill's are a few late Summer models of excellent workmanship and design. These must be cleared to make room for a more extensive stock of Autumn models, and hence they are OFFERED AT CONSIDERABLY REDUCED PRICES. Here is a good opportunity for *you* to benefit by the inter-season change of stock.

Dunhill's Sidecars are unrivalled for value and reliability. The chassis is thoroughly tested, strong, and well-sprung, and is fitted with first quality tyres. The body is wrought in durable wicker, or coach built, with plenty of storing space, and can be upholstered to suit the requirements of the purchaser.



WRITE FOR OUR NEW MOTOR CYCLE CATALOGUE.

£4 - 15 - 0 Complete. NOTE THE PRICE

Club News.—

Blackpool and Fylde M.C.C.

The annual reliability trial was held on the 27th ult. Route: Blackpool, Lancaster, Ingleton, Hawes, Sedbergh, Kendal, Shap, Penrith, Patterdale, Kirkstone Pass, Windermere, Newby Bridge, Milnthorpe, Lancaster, Blackpool, a total distance of 210 miles. Result:

		Marks lost.	Time error. m. s.
1.	F. Naylor (7 Indian)	0	0 0
2.	S. O. Taylor (3¾ Scott)	0	2 45
3.	W. R. Furlong (3½ Bradbury) ...	7	9 25

Special Prize for Best Sidecar Performance.—J. J. Day (3½ Bradbury sc.), 0, 0m. 45s.

Hampshire M.C.U.

A reliability trial took place on the 4th inst. over a course of 106 miles, including many well-known hills—South Harting, Duncton, Down Place, and Hyden Wood. Two of these were observed, and the other two were in non-stop sections. The following clubs took part: Portsmouth and District M.C.C. (the organising club), Bournemouth M.C.C., Southampton A.C., Southampton and District M.C., Fleet M.C., and Winchester M.C. The following gained first-class awards:

Class I.—H. Adams (3½ Matchless), W. P. Brandon (3½ Triumph), F. Tappenden (3½ Premier), J. Edney (3½ James), C. Bennett (3½ Rover), C. Jeffries (2¾ Humber), and J. Tuffin (3½ Rudge).

Class II.—R. C. Pearson (3½ Premier sc.) and S. C. Matthews (3½ Rover sc.).

Class III.—C. H. R. Norrington (6 Royal Enfield sc.), W. J. Fleetwood (8 Matchless sc.), and D. Druitt (6 Royal Enfield sc.).

Burma Motor Association.

A fast half-mile and a flexibility trial were held at the Mandalay (Upper Burma) centre on July 6th, the events being on handicap, cars and cycles competing together. Results:

Half-mile: 1, Maung Suliman (2¾ Humber); 2, Engr.-Lieut. C. Constable, R.I.M. (25 Overland); 3, Capt. C. E. Dease, 91st Punjabis (7-8 Bat); 4, L. Stewart (3½ P. and M.); 5, H. Walton, P.W.D. (3½ Rudge Multi); 6, G. Calogreedy (3½ Triumph); fastest time of the day, Capt. C. E. Dease (7-8 Bat), 63 m.p.h. Six cars and nine cycles ran.

Flexibility: 1, Engr.-Lieut. C. Constable, R.I.M. (25 Overland); 2, L. Stewart (3½ P. and M.); 3, Major H. A. Williams, I.M.S. (16-18 Bedford); 4, J. Morrison, P.W.D. (3½ Triumph); Capt. C. E. Dease, 91st Punjabis (7-8 Bat); 6, Capt. P. K. Tarapore, I.M.S. (12 Renault). Six cars and nine cycles competed.

It is proposed to hold a six days' trial in November over a very difficult course, comprising no less than fourteen hill-climbs of upwards of 2,500ft.

H. R. Lane (8 h.p. Rex-Jap sidecar) fastest time and first on formula in Class IV. at the Sutton Coldfield and Mid-Warwickshire A.C. members hill-climb.

"The Motor Cycle" Diary of Week-end Club Events.

Aug. 16th.	East Essex M.C.C. Hill-climb.
,,	Dublin and District M.C.C. Slow hill-climb at Glencullen Bridge.
,,	Liverpool A.C.C. Social run to the Lake District.
,,	Banbury and District M.C.C. Run to Bicester, Brill, and Oxford.
,,	Bristol Sports Club. Run to Congresbury.
,,	Leicester and District M.C.C. Run to Derby.
,,	Purley and District M.C.C. Annual hill-climb.
,,	South-Eastern Counties Inter-club Team Trials for Woolwich Club's cup.
,,	Surrey M.C.C. Penalty run.
,,	Walthamstow M.C. Run to Harlow.
,,	Stirling and District M.C.C. Gymkhana at Bridge-of-Allan.

INTERNATIONAL CUP RACE IN FRANCE.

The above event, which was briefly reported in our last issue, was held at Le Mans, and resulted in a fine race in the 500 class between Cuzeau (Terrot) and Woodhouse (Clément). Gabriel (Triumph) was third, less than a minute behind the second man, and another British machine, a B.S.A., ridden by Isodi was fifth.

The distance was 201¼ miles, and below we give the times of the first four riders:

	Rider and machine.	h. m. s.
1.	Woodhouse (Clément)	3 47 54
2.	Cuzeau (Terrot)	4 13 18
3.	Gabriel (Triumph)	4 14 15
4.	Isodi (B.S.A.)	5 7 5

The 350 c.c. class was rather tame, as only three out of the total entry completed the distance, and five only finished the second round. Guilloreau (Terrot) won in 5h. 11m. 24s., Lehmann (Alcyon) being second in 5h. 23m. 46s.; Lacroix (Peugeot), 5h. 32m. 49s.

In the sidecar classes (167½ miles) Delaunè's B.S.A. was the only competing machine in the 500 c.c. class, and he had a walk over.

The times for the 1,000 c.c. class were:

	Rider and machine.	h. m. s.
1.	Vanella (7 Indian)...	4 33 9
2.	Besnier (Premier)	5 6 2

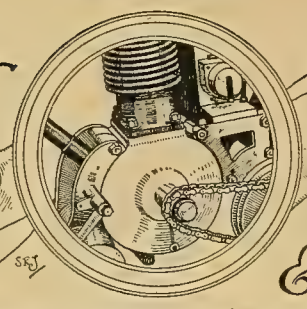
The cycle cars were much faster than the sidecars, and out of a total entry of twenty in the two classes (1,100 c.c. weight limited and 1,100 c.c. weight unlimited) the Violet-Bogey, driven by M. Violet, and the Ronteix driven by M. Muraour, were first in their respective classes. The times and positions of the first three were:

Rider and machine.	h. m. s.
Muraour (Ronteix)	3 37 25
Violet (Violet-Bogey)	3 38 54
Bas (Baby Peugeot)	3 39 52

STREATHAM OPEN HILL-CLIMB.

The Streatham and District M.C.C will hold their fourth open hill-climb on the 30th inst. The locality of the hill will be announced on the day of the climb at the Crown and Sceptre Hotel, Streatham Hill, and the White Hart, South Harting, where weighing in will take place between twelve and two o'clock. There will be ten classes decided on time and formula, divided in "open" and "expert barred." *The Motor Cycle* formula will be used except in one case where the A.C.U. formula is thought to be more suitable. The awards will consist of the Tilley Challenge Cup and gold and silver medals. In the case of sidecars and cycle cars, competitors must obtain the weight of their machines, rider, and passenger, and bring the weighbridge ticket with them to hand to the Clerk of the Scales. Winners' weights in these classes will be checked after the competition.

QUESTIONS & REPLIES



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Overloading on Hills.

I should be obliged if you would answer the following questions: Why my 1911 Kerry-Abingdon with sidecar, when ascending hills, if I give more than about half throttle, loses speed instead of gaining? I have fitted caps to take up clearance between the tappet and the valve lifts $\frac{3}{16}$ths. Should I get more power on hills if I time magneto a little late? The points are about to break when the piston is at the top of the stroke. I have to retard quite half when ascending hills. What is the best way to get the magneto chain wheel off? I have tried, but cannot move it.—H.D.

You do not state in your letter whether you have a change speed gear fitted to your machine, but from the symptoms we imagine you have not; and, if not, it is probably a case of overloading your engine. If instead of opening the throttle wider on hills you tried closing down the air instead, you will probably get better results. The tappet and magneto adjustment are probably correct, as mentioned in your letter. As a general rule, it is not advisable to take the wheel off the magneto at all, but if it is essential that you remove it, it should be quite easy to take it off if, after removing the holding nut, you give it a few light taps with a copper-headed hammer, and at the same time hold a piece of wood firmly behind the wheel, so as to help to wedge it off; but we strongly advise you to leave this wheel alone.

Yorkshire to Cornwall.

Will you kindly give me the best route from Sheffield to Mevagissey, Cornwall? Please give distance and a route suitable for $3\frac{1}{2}$ h.p. three-speed and sidecar. I should like good scenery and roads, preferably missing the large towns. I find if you miss large towns, in which I generally get lost, it increases the net speed for the journey considerably. I suppose you would consider the above journey too much for a long day's riding? I believe the Bath-Cheltenham Road is bad.—P.H.D.

Your best route is Sheffield, Chesterfield, Ripley, Derby, Burton, Ashby-de-la-Zouch, Nuneaton, Coventry, Warwick, Stratford, Evesham, Tewkesbury, Gloucester, Bristol, Red Hill, Bridgwater, Taunton, Wellington, Cullompton, Exeter, Okehampton, Tavistock, Callington, Liskeard, Lostwithiel, St. Austell, to Mevagissey. The run would certainly be too far in one day in comfort, and we would suggest Bristol as a stopping-place for the night. It is impossible to make this journey to avoid all towns, but we have drawn it up to enable you to miss Birmingham, and the only town on this route that is at all difficult to negotiate is Bristol. This town also can be avoided by turning to the right at Filton, where the Bristol trams are met, and going over Clifton Downs and the new bridge over the Avon.

A Question of Liability.

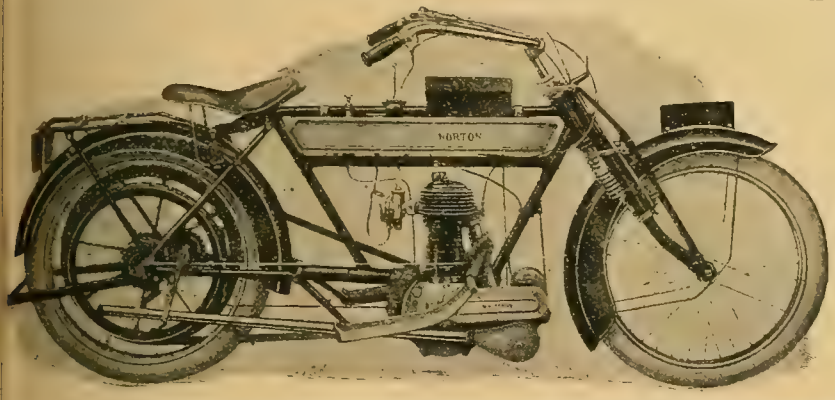
I should be greatly obliged by your legal expert's advice in the following case: My brother was lately driving a sidecar outfit with empty sidecar, and overtook a motor char-à-banc, which, after duly hooting, he attempted to pass. He apparently cleared the back wheels of the vehicle, and was abreast of the front wheel, when the driver turned sharply to the right and caught the sidecar with his wheel or guard. The outfit overturned and was badly smashed, and my brother is now in bed suffering from cuts, bruises, and shock. My brother says that he had passed the rear wheels when the char-à-banc swerved, and he could not avoid the collision, as the pavement was too high to mount. (1.) Was my brother entitled to pass? (2.) Can he claim for damages and injuries sustained? (3.) Was the char-à-banc entitled to turn without due warning and care?—HAMPDEN.

We have submitted your letter to our legal adviser, who replies as follows: "If the Court is satisfied that the information he gives is correct, I think your correspondent's brother has a good claim against the owner of the motor char-à-banc. I therefore answer the three questions as follows: (1.) Yes. (2.) Yes, but he ought to have some witness to support his own evidence before actually commencing proceedings. (3.) No. I notice nothing is said as to the rate at which your correspondent's brother was going. Of course, if he was going at too fast a speed, he was guilty of contributory negligence, and this would debar him of any right he would otherwise have to claim damages. As before mentioned, I cannot recommend proceedings unless there is some independent evidence to support the claim."

Motor cyclist University students at the Officers' Training Corps Camp at Ilkley, Yorkshire.

COMFORT is one of the outstanding features of the unapproachable NORTON

Not only the comfortable riding position afforded by the exceptionally long wheelbase, comfortable footboards, and entire absence of vibration due to perfect balance, but the comfort due to the knowledge that underneath you there is **POWER** and **PLENTY OF IT,** that nothing will go wrong or come adrift, that you are certain of climbing any hill on any road anywhere.



That is what is meant by the combination of the word in **"COMFORT"** with the unapproachable **NORTON.**

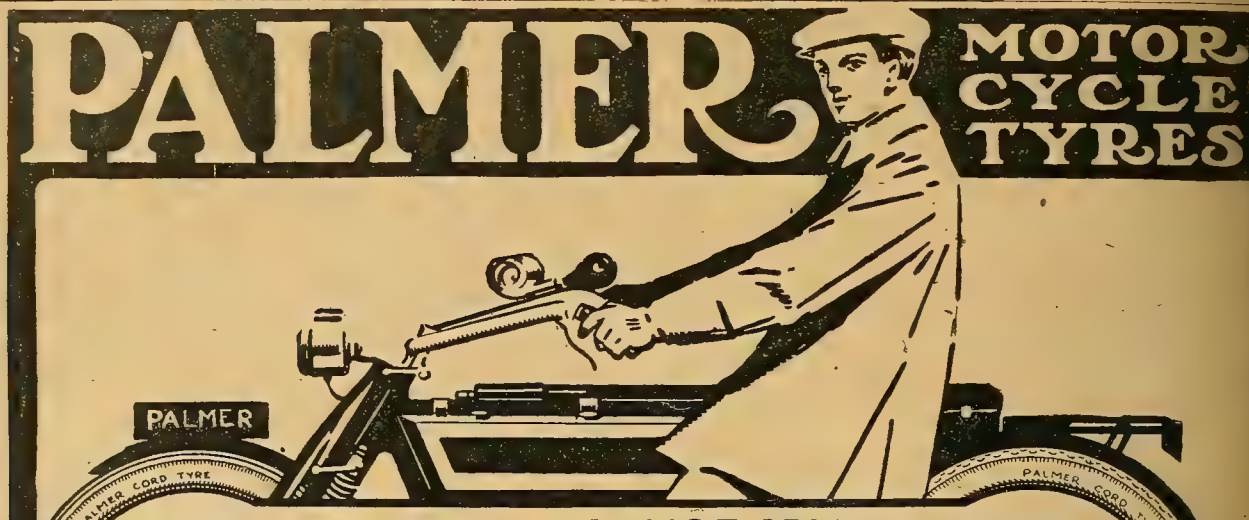
PALMER MOTOR CYCLE TYRES



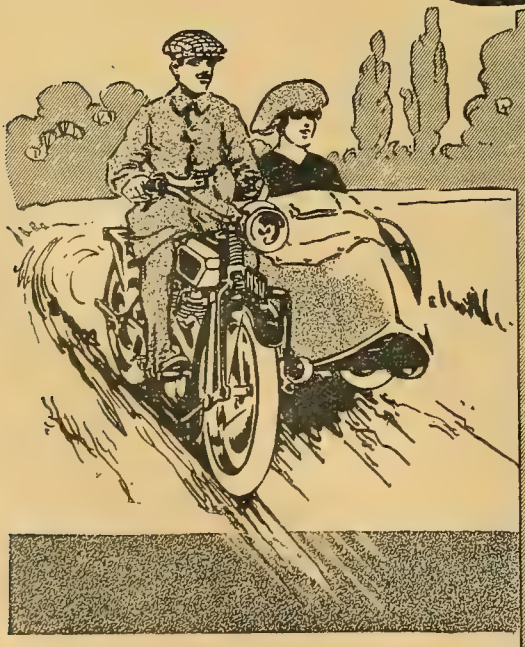
PALMER CORD MOTORCYCLE TYRES

are infinitely more reliable under the strains of motor-cycle work than any tyre with a canvas foundation; they wear longer, give regular, satisfactory service, and are practically immune from punctures.

Write for Motorcycle Tyre Booklet.

THE PALMER TYRE, LTD.,
119, 121, 123, Shaftesbury Avenue, London, W.C.
Motorcycle Tyre Dept. :
103, St. John Street, Clerkenwell, London, E.C.

FOR SIDE-CAR WORK THE 6½ H.P. N.S.U



fitted with the N.S.U. two-speed gear and free engine, and our special sidecar, is a combination guaranteee to give the utmost satisfaction. The overhead inlet valve type of engine employed on these machines is not only extremely economical and efficient but keeps remarkably cool even when run for a long period on the low gear.

The lessons of eleven year's experience embodied in these motor cycles are as invaluable to you as they are to us, and it will prove a machine, the choice of which you will never regret.

MODELS (with adjustable pulley) :

2 h.p. Single cylinder, **£34.** 3 h.p. Twin cylinder, **£45.**
3 h.p. „ **£43.** 6½ h.p. „ **£58.**

The N.S.U. two-speed gear and free engine can be fitted to practically any make of machine. It is simple, reliable, and above all, extremely light.

With fixed pulley, **£7.** With adjustable pulley, **£8.**

Write for further particulars.

Buying a Magneto.

I have a tricar fitted with accumulator ignition, and I wish to convert it to magneto in place of the accumulator and coil, as the latter are a constant nuisance. I have been on the point of purchasing several second-hand magnetos, but feel that I want some advice, as I have never had any experience with this form of ignition, except what I have read about it. Will you kindly inform me how I should test a second-hand magneto before purchasing, and if out of order can I get it repaired, and, if so, is such a repair expensive? Does the magneto have to be timed to suit the engine?—A.F.

To purchase a good second-hand magneto requires experience. To test it fit a special spanner on to the high-tension terminal, or connect a piece of wire from the terminal, and adjust either the magneto or the wire so that there is a gap of about the thickness of a visiting card between it and the magnets, rotate the magneto spindle with the hand sharply in the correct direction, and if there is a good spark, as far as can be told the magneto is in order. Do not attempt to buy one which is out of order. Magnetos last almost indefinitely. They are fairly expensive, however, to be repaired. You have to time the magneto to suit the engine, and, generally speaking, the larger sized magnetos afford easier starting.

A Carburetter Difficulty.

Would you be good enough to advise me on the following points: I have a new 1913 Douglas to which I have fitted an Amac carburetter. It will not run slowly, and if I throttle down it misfires, and if I throttle down further it fires only on one cylinder, and then stops. No dodging about with the air lever rectifies this. In addition to this it pops and spits violently in the carburetter if the exhaust valve is raised. At a fast pace it travels well, though the machine is not as good at hills on top gear as it should be. Consumption is roughly 100 miles to the gallon, which I consider bad. I also consider the new mudshields overheat the front cylinder badly. There is no air leak to carburetter.—H.T.M., M.D.

At the present moment we are using a 3 h.p. Motosacoche fitted with an identical carburetter, which, however, has a 26 jet. In this machine it is absolutely automatic. One starts with the air lever half open and leaves it there the whole day long; it will run slowly and behaves perfectly. Probably it is a little bit more extravagant adjusted in this manner, but the machine is such a pleasure to drive that we should not think of altering it. Perhaps the fitting of a similar jet might help matters. We do not think 100 miles to the gallon is at all bad, and probably any alteration in your carburetter or change of carburetter will make this consumption a good deal worse. The Amac carburetter is perfect when correctly adjusted, and we advise you to try different jets till you get perfect combustion, and do not worry if your miles per gallon fall to ninety or so.

Benzole and Rust.

I should esteem it a favour if you can supply me with the following information: (1.) Quite recently I gave a trial to benzole, and found it gave a 10% increase in mileage and also a distinct advantage over petrol on hills. However, I am given to understand that its use will rust the tank if its specific gravity is more than .750, owing to the larger percentage of impurities in a heavier spirit, and should this be the case I consider the advantages are more than counterbalanced. (2.) Can you recommend me the best standard works dealing with the theory and construction of petrol internal combustion engines as applied to cars and motor cycles?—H.G.W.

(1.) We have never heard that benzole will rust the tank, and are unaware that it will do any harm to the engine if the mixture is anywhere near correct. Benzol does, however, damage the enamel. (2.) The best-known work on the subject is that by W. Worby Beaumont, entitled "Motor Vehicles and Motors," Vols. I. and II., price £2 2s. each.

READERS REPLIES.

Steering with Sidecar.

I have the same experience in rounding left-hand corners (at any fast speed) as "E.S.," and I presume it is general, with a rigid type of sidecar wheel. I do not pose as an authority, but would ask whether the tendency of the combination to run straight on, and the sidecar wheel to leave the ground, is not due to the speed being too great to allow of the sidecar wheel to act as a pivot for the cycle to turn on? I suggest that such is the case, and if "E.S." will adopt the simple expedient of slowing down at corners, he need have no more nightmares.—R. G. S. Buckland.

Taking Machine to Australia.

I noticed a letter in *The Motor Cycle* of July 31st asking for information on this subject, and as I have some knowledge of Australian Customs, I give the following facts: (1.) Twelve months' possession (proved by production of registration and original invoice, etc.) entitles the machine to be classed as "personal effects" free of duty. (2.) Your estimate of cost, packing, etc., seems rather low, and the extra cost of having it shipped per mail steamer is worth the extra, as there is more system exercised in discharging small shipments. (3.) Duty on second-hand machines is according to the Customs valuation, which is generally in the vicinity of the original wholesale price. (4.) It makes no difference to the percentage of the duty whether the machine is new or second hand. (5 and 6.) The duties of 25 and 30% are charged on the value, plus packing and forwarding to steamer (except actual cost of case), and to this is added 10%, and duty charged on the whole. Documents supporting these charges must be produced to the Customs. Most of the leading makes, such as Rudge, Bradbury, Triumph, F.N., Zenith, Douglas, New Hudson, Humber, and many locally built J.A.P. and Precision-engined machines, can be obtained in any of the Australian cities, and prices for both new and second-hand average about 30% above London figures. Personally, I should never think of again taking a machine out. As it happened, I was saved much trouble by my machine being burned at sea on the voyage in another boat. I have since been in the trade in Western Australia, and my experience with the Customs has convinced me that it is cheaper in the long run to buy a second-hand machine locally. It should also be borne in mind that, whilst the private owner pays duty on the retail price, the local importer in the trade pays on the wholesale value.—F. L. Parsons.

EXPERIENCES WANTED.

"J.H.L." (Edinburgh).—Automatic oiling arrangement of the Enfield.

"G.R.S.B." (Bideford).—Whittle and Wood-Milne steel-rubber belts, and Stanley link. Size of belt used on Rudge Multi with sidecar.

"E.W.G." (Birmingham).—Wall Autowheel. General reliability and wearing properties.

THE INCREASING USE OF MOTOR CYCLES IN THE ARMY.

Motor cyclist members of the London Scottish Regiment in camp at Abergavenny. Their kilts give one the impression that they find motor cycling the coolest pastime extant.

Spare Tube Cases.

Messrs. Bransom, Kent and Co., have been appointed distributing agents for the neat leather spare tube bag, illustrated on page 977 of our issue of July 24th.

Sidecars in Scotland.

J. Chater-Lea, junr., writes to inform us that it was the sidecar springs that broke in the Scottish Trials on his 7 Chater-Lea sidecar, and not the frame as reported.

A Puncture Preventer.

L. L. Sealey, who won a gold medal in the recent Scottish Six Days' Trials, has, we hear, expressed his appreciation of Puncture Seal, which, he says, enabled him to get through the week's strenuous work without the slightest trouble.

A Successful Tyre.

In the Scottish Trials Kempshall tyres were awarded sixteen gold medals and special prize for best performance of a private owner, in addition to which Mr. S. T. Tessier, using these tyres, tied for special trade prize.

Oil in Scotland.

We understand that out of forty-one gold medal winners in the recent Scottish Trials, thirty-four used Castrol motor oil, and that the winners of the team prize, the lightweight prize, private owners' prize, and trade riders prize also used this brand of lubricating oil.

To Manufacture a Cycle Car.

We are informed by Messrs. Marshall Arter and Co., Beavor Lane, Hammersmith, W., that the concern has just been registered as a limited liability company. Messrs. Marshall Arter, Ltd., will continue to specialise in the production of the well-known cycle car bearing their name.

Frank Philipp, the Scott rider, who will be a notable absentee from the Six Days' Trials. He has lately been able to ride to and from the Scott works to his home.

Big Australian Order.

We are informed that a consignment of Puncture Seal to the value of £1,000 has been despatched to Australia.

Tyres at Brooklands.

Four winning machines at the Brooklands August Bank Holiday meeting were fitted with Continental tyres, in addition to which riders using these tyres also secured two second places.

A Correction.

In our report of the reliability trial of the Islington and District M.C.C., which took place on the 20th ult., we mentioned that H. Ward, the winner, rode a 4¼ Precision sidecar. This should have been stated to be a 4¼ Grandex-Precision sidecar.

A Successful Belt.

Lyso belts have performed well in recent trials. In the Scottish Six Days' Trials Mr. and Mrs. Baxter, J. Morrison, and J. A. Hoult were successful users, while in the Dutch Trials, R. Holloway and Sam Wright gained gold medals on machines fitted with this make of belt.

Tyres for Six Days' Riders.

We are asked to state that Messrs. J. Pedley and Son, Ltd., will have a supply of their tyres and belts at the Electrical Engineering and Motor Co.'s garage at Carlisle during the forthcoming Six Days' Trials, for the benefit of competitors who desire to fit these goods.

A Comprehensive Stock.

Messrs. Palmer's Garage, Tooting, S.W., send us a very comprehensive catalogue of the machines and accessories in which they deal. The list is admirably illustrated, and really a very interesting production, a copy of which may be obtained by any reader of *The Motor Cycle* on request to Messrs. Palmer's Garage. A large number of cycle cars, motor cycles, and useful accessories are illustrated.

Catalogues Received.

J. Pedley and Son, Ltd., Oxford Works, Great Charles Street, Birmingham (Pedley tyres and belts); The City Ignition Co., 359, Goswell Road, E.C. (Cicoy-Fein magnetos, accessories, and fittings); John Piggott, Ltd., 117, Cheapside, E.C. (July sale catalogue, containing much of interest to motor cyclists); F. C. Armstrong, 507-9, Harrow Road, London, N. (Armstrong motor cycles. These machines are made with 2¾ h.p. two-speed Villiers motor unit); Terry and Co., Redditch ("A Few of Terry's Motor Specialities"); Norton and Co., Sampson Road North, Birmingham (1913 Norton).

Bowden Success at Ghent.

We learn that Messrs. Bowden Wire, Ltd., London, and its associated concerns in Paris, Berlin, Milan, and Brussels, have been awarded the Diplôme d'Honneur for their joint exhibit of Bowden articles at the International Exhibition at Ghent.

A Rear Mud Flap.

The Cycle Necessities Manufacturing Co., of Vine Street, Birmingham, are now making their Pivotal Mud Stop, recently illustrated in these pages, for attachment to the cross stay of the rear stand. This attachment will fit any motor cycle, and stops all mud flung from the rear wheel. When ordering, the diameter and width of the cross stay on the stand should be given; the price is 4s. 6d.

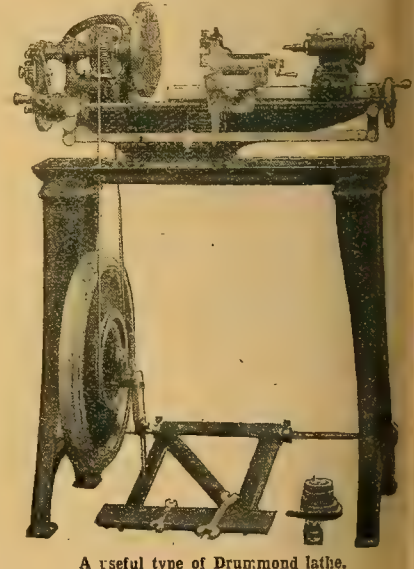
A Useful Lathe.

Particulars of a new design of Drummond lathe have been sent us from Drummond Bros., Ltd., Rydes Hill, Guildford. This well-designed tool should form an essential part of every amateur's workshop, since this particular make of lathe is noted for accuracy, even after a long period of work.

The bed is of heavy pattern with a short gap mounted on a cast iron tool tray and standards. There is a back-geared headstock with steel hollow mandrel bored from the solid and running in adjustable gunmetal bearings. The advantage of a hollow mandrel is, of course, that material may be fed through it. The saddle is self-acting, sliding and traversing. The lead screw (full length of bed) is fitted with hand and automatic throw-out action, and is provided with a handwheel. All gears are cut from the solid.

We hear from Messrs. Drummond that a 3½ h.p. motor cycle engine was actually made on one of the new 3½in. centre lathes. This is certainly a proof of the suitability of this lathe for the more intricate work, and for jobs on a larger scale than are ordinarily undertaken.

The length of this lathe is 3ft. and breadth 1ft. 9in. The net weight is 365 lbs., and the length of bed is 2ft. 6in.



A useful type of Drummond lathe.

AMAC AMAC

8 Points about the BRAMPTON Variable Gear

1. It gives seven speeds
2. And a free engine.
3. It is light and compact.
4. Simple and easily operated.
5. Gives a positive drive in all weathers.
6. Never slips, even on bottom speed.
7. It enables a low or medium powered machine to do the work of one double its h.p., and is therefore an *economy*.
8. It can be fitted to practically all engines where the boss does not necessitate a recess in pulley flange of more than 7/16th in. deep.

Proof of efficiency is shown by the following letter—typical of many.

Selous Street,
Blackburn,
7th July, 1913.

Dear Sirs,
The Brampton Gear fitted to my 3½ h.p. Rudge has given me every satisfaction, and I consider it equal to a 6 h.p. machine with fixed pulley. In fact, on a previous run I remember a 6 h.p. stuck half way up a very steep gradient, which I took at low gear without trouble, with a 14 stone passenger.

Yours truly,
(Signed) T. ENGLAND.

Price: 3½ h.p. £4-4
Price: 2½ h.p. £3-10

POWER ON THE ROAD OR SPEED ON THE TRACK.

High speeds attained in competition over specified distances on the track or road is not a true test of the capabilities of a motor cycle under every day touring conditions.

Machines competing in speed events are, like race horses, tuned up to just stay the distance. Their constructional defects quickly become apparent when subjected to hard road work, yet under the guise of widely advertised speed successes potential motor cyclists are lured into buying such a frail piece of mechanism in the belief that it will render them an efficient and reliable road service.

The public, however, are realizing more fully day by day that purely speed successes are simply an astute business device for creating demand and influencing sales. Like motor cyclists who know, they pertinently ask "What kind of road service will such a machine render?" and then with greater compunction turn to the consideration for choice of mount to a motor cycle that has given a good account of itself on **all** roads under **all** conditions **all** over the world.

The L.M.C. has never failed to acquit itself creditably in any land; proved by its consistent success in road trials and confirmed by the testimony of owners, whose opinions are quoted at length in our art catalogue.

Here is an extract of a recent letter eulogising the power and reliability of the L.M.C.

"The machine has never given me any trouble. I can climb any hill in Anglesea with two on the motor, and have so far never met with any hill which I have failed to climb. My machine is now nearly three years old and I can always rely upon it. H.C.H. 12/7/13."

BURBERRY TIELOCKEN COAT.

Illustrated Catalogue and Patterns of Gabardine Post Free.

When buying Burberry see that— The label says 'Burberry'— The bill says 'Burberry.'

BURBERRYS LATEST INVENTION for the Motor Cyclist or Motor Boatist—a double-breasted, buttonless coat, designed to provide unequalled security and comfort under the severest conditions.

BURBERRY WEAVE-PROOF GABARDINE, lined with proofed wool or camel-fleece, makes the Tielocken Coat a perfect safeguard against driving rain, chilling wind, dust, or spray.

LIGHTWEIGHT, YET WARM, Burberry Gabardine provides efficient protection against the worst weather vicissitudes, yet ventilates like ordinary cloth, thus preventing all danger of overheating or chill.

THE TIELOCKEN COAT, fastened with single strap-and-buckle, is easily put on or taken off. Worn with Trouserettes of Gabardine and Tielocken Gaiters, it supplies the finest protection available against the ill effects of exposure to wet or cold.

TIELOCKEN DUPLEX PROTECTORS, an application of the same principle, provide a four-fold yet airy safeguard of proofed Gabardine and proofed wool for keeping the knees and thighs dry in the heaviest rain.

PRICES: Tielocken Coat in Gabardine, lined proofed wool, 63/-; Gabardine Trouserettes, 31/6; Protectors, 15/-; Motor Cycle Cap, which can be readily transformed into a snug-fitting helmet, 15/-.

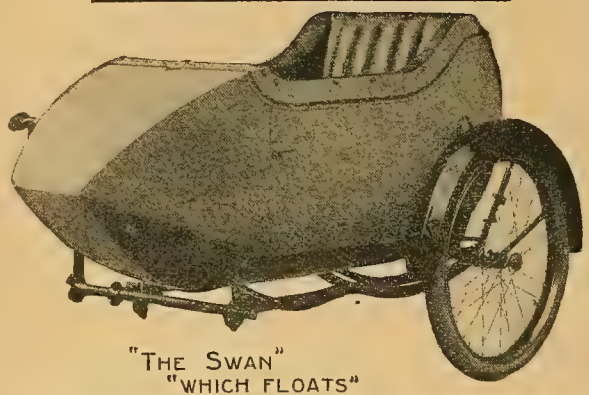
8 and 10 Bd. Malesherbes, PARIS, and Provincial Agents.

"THE SWAN."



"THE SWAN"
"WHICH FLOATS"

Is it not a most important point that you should know the genuine makers of the sidecar of your choice, and thus then be able to judge for yourself what class of material would be likely to be used in the construction thereof?

We can fairly claim that we do, from start to finish, make the "Swan"—the rough material coming in, and the finished article going out—and thus are we able to see that the very best is used in its making and construction—and thus also are we able to control the skilled work that turns such material to advantage. Such finely finished work as is entailed in the "Swan" would be soiled in other hands but our own.

Indispensable to the amateur worker.

Obtainable from—

Iliffe & Sons Ltd., 20, Tudor Street, London, E.C.,

And all leading booksellers.

SIX DAYS' RELIABILITY TRIALS.

Important Notice.

MOTOR cyclists will find that the Garage most convenient for the Trials is right opposite the Official Garage at the foot of LOWTHER ST., CARLISLE, and the ELECTRICAL ENGINEERING AND MOTOR CO., LTD., are holding large stocks of tyres, belts, and other spare parts which may be required, suitable for every machine on the market. They are also providing a clubroom for the motorists during the trials, and will be pleased to attend to every requirement.

THE GARAGE IS OPEN DAY AND NIGHT, AND CAN EASILY BE DISTINGUISHED BY THE LARGE FLAG ON THE ROOF.

"The Motor Cycle Journal of Canada," for April, 1913, says:—

COVENTRY CHAINS

"A large number of the racing machines in the States are fitted with **COVENTRY** chains. One rider, Ray Peck, used this chain on his mount all last summer and

DID NOT SUFFER A SINGLE BREAK

in any of his many races.

"THE COVENTRY" CHAIN CO., LTD., COVENTRY, England.

SELFRIDGE'S

The Ideal Store for Motor Cyclists.

YOU can have immediate possession of any of the Motor Cycles listed below on payment of a fifth of its cost.

Payment of the balance can be extended over a year. For this added convenience we charge 2½% on the balance only.

The extra is only 2%, or less, on the entire cost of your machine. The greater your original deposit, the less your machine costs in proportion.

Can be adjusted and set in perfectly horizontal position.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To insure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Plan showing division of England into Sections.

SECTION I.
Northumberland, Cumberland, Durham, and Westmorland.

SECTION II
York and Lancashire.

SECTION III.
Carnarvon, Denbigh, Flint, Cheshire, Derby, Stafford, Shropshire, Montgomery, and Merioneth.

9 SHOE LANE. FLEET STREET LONDON.E.C.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. ooo, c/o 'The Motor Cycle,' Coventry" or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

SOMETHING TO CROW ABOUT

THE Watawata Belt

WELL TRIED AND WELL SPOKEN OF.

A few opinions taken haphazard from a sheaf of testimonials—

"The belt has now done 1,700 miles. Since I used it I have not had a single stop on the road for transmission troubles."

"My experience is, the Watawata belt NEVER SLIPS."

"A remarkably efficient belt."

"At Matlock Bridge I rode up the famous Bank and down again, and being told there was another hill that no motor cyclist had ever succeeded in getting to the top of, I at once rode up that also. I have used most belts on the market, but yours is streets ahead of the lot."

YOU CAN DO WONDERS WITH **A WATAWATA.**

Send for illustrated booklet.

tor Cyclists and National Defence.

FTER turning an indifferent ear to the value of the motor cycle as an adjunct to troops to be used as a rapid means of communication and for scouting purposes, the War Office have now gone to the other extreme and are actively uraging motor cyclists to enlist in a special motor sts' corps under the various Territorial divisions. decision of the authorities has been arrived at ie result of experiments carried out some time back ttaching motor cyclists to the Royal Engineers as atch bearers and scouts. The experiments were iently satisfactory, and a definite scheme has now evolved by the War Office for the enrolment and meration of riders.

hile we are naturally gratified at the recognition ie authorities of the merits and usefulness of the or cycle, we cannot but think that the terms offered none too alluring. They will probably attract s, but, what is even more important than obtaining nen, will they retain them? It is obvious that for smooth working of the scheme it is essential that ame men—or at least a large proportion of them—ld be available year after year. Otherwise, with very limited period of yearly training allowed for r the scheme, a mere eight days minimum or n days maximum, it will be most difficult to keep constant stream of well instructed and properly plined men.

cannot be said that the terms offered err on the of generosity. The machines must come up to a high standard of efficiency and equipment, and allowances, all told, amount to a mere 8s. a day over the cost of petrol and oil and depreciation. ain small messing allowances are also given, but n it is remembered that on training and manœuvres ines must necessarily suffer far greater depreciation than even under the hardest private use, we nit the sums mentioned are insufficient. We think War Office should allow 10s. a day for depreciation also provide petrol and oil. A certain amount of ism has been levelled at the decision of the orities to insist on the use of a change-speed e, but here we are sure they are perfectly correct, he T.T. machine is not the type likely to be the suitable for the purpose required. The War e also reserve to themselves the right to purchase machines in the event of war, a certain fixed rate epreciation being deducted from the original price. Some otherwise would-be volunteers think the prices offered insufficient, but after all it must be borne in mind that a man who volunteers to serve his country must be prepared to make sacrifices, and we welcome the scheme as put forward by the War Office.

A Popular Error.

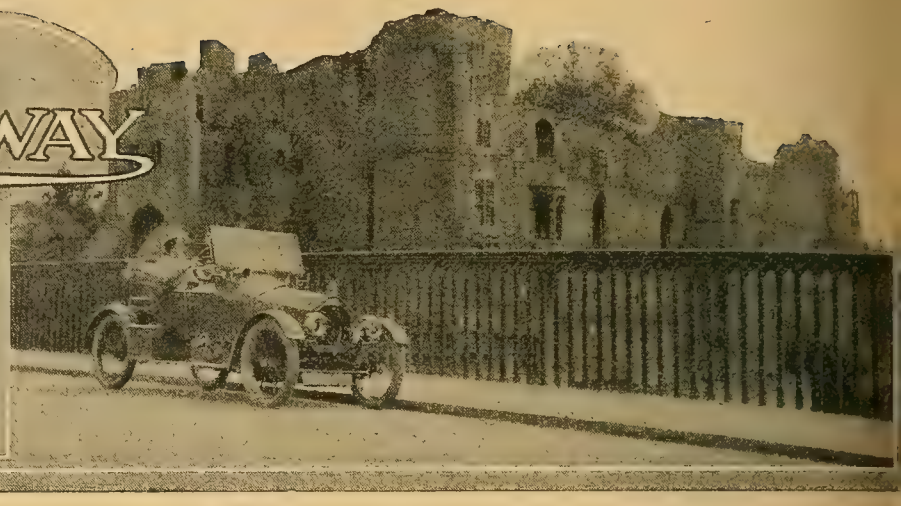
A LEADERETTE writer in a daily paper published last week drew attention to the delights of pedal cycling, and in his enthusiasm for his favourite pastime bewailed the fact that the popularity of motoring in general and motor cycling in particular had robbed the pedal cycle ranks of many old adherents. We have no quarrel with him concerning the pleasures derived from the use of a bicycle, as we have experienced the utility, economy, and general handiness of a pedal cycle for many purposes where a motor cycle or car would not be so convenient. However, in one of his comparisons between the push cycle and the motor cycle the writer of the article in question is a trifle misleading, and appears to labour under the delusion that a motor-propelled vehicle is not so reliable as it might be. For instance, he says, "The motor cycle is the imperious master of man, the push cycle is his ever-ready servant." How many motor cyclists in these days will agree with this dictum? Very few indeed, we think, because a motor cyclist is never satisfied until he has mastered every detail of his machine and knows what every part is doing when it is at work, and why it does it. The reliability of the pedal cycle and motor cycle cannot now be compared to the detriment of the latter.

The same writer falls into the usual error of imagining that speed and distance are the aim and goal of every motorist. It is true a big proportion worship at the feet of Mercury, but a still larger number take up the pastime for the reason that they can reach beauty spots far from home in so short a time as compared with pedalling; once on their favourite touring ground they are content to dawdle about and enjoy the sights, and because they ride a motor cycle are not ever on scorching bent. A large number also make use of a motor cycle for business purposes solely. In a few years something else will attract the public eye to a greater extent, and then motoring will become like pedal cycling, almost entirely utilitarian, and writers in the dailies will not imagine that all who ride motor cycles are speed maniacs.

The FOSSEWAY

UP TO DATE

RE-OPENING OF ROMAN HIGHWAY BETWEEN LEICESTER AND LINCOLN



The ruins of the old castle at Newark which is just off the Fosseway.

SOME few months ago there was considerable discussion as to the advisability of bringing up to date that fine Roman road, the Fosseway. The R.A.C. took an interest in the matter, and eventually the work was proceeded with by the Road Board, who are finding the whole of the money, though the Notts County Council is doing the work. The most important roads of the Roman system were the "Royal Roads," or, as they are generally called in mediæval records, the "Four Ways," which in the laws of Edward the Confessor are given as Watling Street, the Fosse, Ermine Street, and Icknield Street, and of which it is said that two ran lengthways and two across the Kingdom. The Fosseway, according to Geoffrey of Monmouth, extended from Totnes to Caithness. Though, until the advent of the Road Board, it had lost considerably in importance, the Warwickshire portion being mostly a grass grown track, it could still be followed for many miles, but the improvement made of late applies to the section extending from Six Hills to the junction of the main Nottingham-Grantham Road, the continuation of the Fosse leading to Newark and Lincoln. We sampl this new road last week, and observed with pleasu that several steam rollers belonging to the Oxfo Steam Ploughing Company were busily engag putting finishing touches to a beautifully smooth grani and Tarmac road which has given place to the gra grown track. Further, the road is being signpost with up-to-date posts, the fingers of which do n obscure one another. The milestones are at prese fixed in the hedgerows, the hedges not having be cleared away, but in spreading the directions over t complete semi-circle the designer of the stones h erred, as it is impossible to read the mileage on o side from the roadway.

The new stretch of road, which measures twelve a and half miles, is entirely in the County of Nottingha and when it is considered that three years ago t stretch was a mere cart track exactly like the prese sides of the road, one can realise the progress mad Many portions of the "way" were found to be in very soft condition and were almost boglike. T method of construction of the new road has been excavate to the required dep to receive the new materi and the base cambered to ½ in 1ft. with side drai wherever possible to drain t surface water from the ro bed. Tarmac is being us throughout. Where the ro is metalled, it is proposed put only a strip, 9ft. in widt up the centre, but where t road has not previously be metalled, it is proposed make the road the full widt of 15ft. in Tarmac. The to cost when completed estimated to be £21,428, a it is anticipated by Mr. Purnell Hooley, the cou surveyor, who kindly furnish us with most of the foregoi details, that the work will completed at Christmas or t

THE OLD ROAD AND THE NEW.

An example of the manner in which the new road has been specially cut near Six Hills.

The Fosseway Up-to-date.—

e ; spring. The rate of progress at present is about
1 yards per day.

Roman Road-builders' Directness.

The main characteristic of Roman roads is their straightness, and this feature is very obvious to the r of the Fosseway. It has been said that no part its entire length is more than six miles from an olutely straight line. Roman engineers, we read "Highways and Byways of England," avoided ves, and instead of going round a hill, morass, or er obstacle with a half-circle, swerved gradually one side or other and picked up their line again n the difficult spot was passed. Not only is the miles stretch of road from Lincoln to Leicester Newark absolutely straight, but there is a remark- e absence of villages along the route; consequently s an exceedingly fast road, and when the sections ch are at present somewhat loose have been ded to, and the widening process been completed, road is bound to become a popular one.

t has been the habit of motorists travelling from cester to Newark (on the Great North Road) and coln to journey *via* Mountsorrel, Loughborough, Nottingham, but the Fosseway provides a much ttier alternative through route, devoid of towns and ages as we have already mentioned. Moral—don't out of petrol! There are one or two cross-roads ere special caution is necessary, but if motorists drive sensibly the danger signs which undoubtedly have been over-done on other roads, and which are so far non-existent on the Fosseway, will still be conspicuous by their absence. One cannot but admire the Roman system of making roads, for when travelling on the Fosseway one can see a white ribbon of road extending far ahead.

A Deserted Highway.

Travelling from Lincoln to Leicester there are but three hills which call for a change of gear, and users cannot fail to be impressed by the road being deserted. During our trip we met only three cars and two motor cycles, so that evidently the route, which has only recently been passable with comfort, is not yet generally known. In modernising the road we were sorry to note that the Nottinghamshire County Council had arranged a rather steep and narrow bridge over the canal, as it is impossible to see ahead, and the accidents which have occurred at such points are proof that the danger would be best wiped out altogether. We can imagine that the new Fosseway is likely to prove exceedingly popular among Midland motorists. From Leicester to Saxondale (where the road crosses the main Nottingham-Grantham road), the distance is 23¾ miles, and the mileages from this point to the following places are: Radcliffe-on-Trent 2¾ miles, East Bridgford 3 miles, Bottesford 8¼ miles, Nottingham 8¾ miles, Newark 11¼ miles, Grantham 15¼ miles, and Lincoln 27¼ miles.

(a) The point near Bingham at which the Fosseway crosses the main Nottingham-Grantham Road. (b) A fine straight stretch on the new Fosseway. (c) Another new cutting on the modernised Fosseway. (d) Near Leicester, showing one of the few houses on the road. (e) Good work by the Road Board. An old bridge between Narborough and Hinckley on the Coventry-Leicester Road which was rendered dangerous by its narrowness; the road has now been considerably widened. The Humberette and stones show the original width.

Occasional Comments by "Ixion"

An Unusual Noise.

A novice brought his machine to me last week with the complaint that the engine ran poorly, especially on hills, and that he was conscious of a constant grinding noise, which formed an under-current of sound below the clack of the valves and the bark of the exhaust. Several local experts had tackled the problem unsuccessfuly, and a hasty call at the factory had proved equally futile. More by luck than judgment I hit on the origin of his trouble in a quarter of a mile spin. The magneto chain was adjusted excessively taut. As soon as it was given the proper amount of slack the engine accelerated well, climbed like a Trojan, and lost the obscure grinding sound.

Another Record.

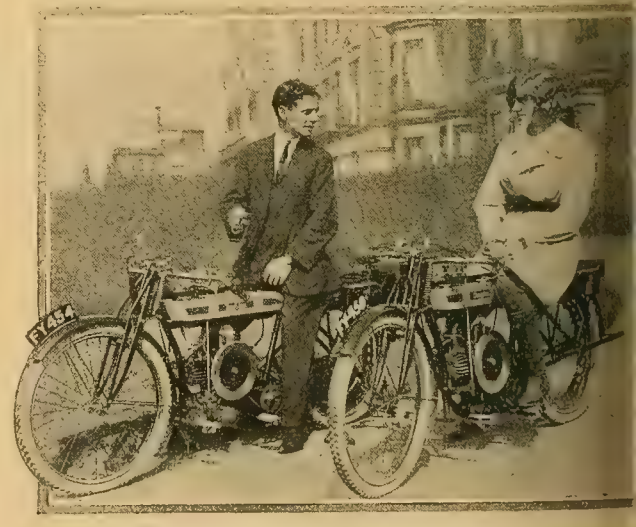
Straws show which way the wind is blowing. Last year I was in the habit of feverishly verifying the adjustment of my three-speed hub controls after very long rides, and it was not an unknown occurrence for me to dismount and reset the adjusters on the road, because the gears did not engage readily, or would not engage at all. This year is already more than half past, and my hub is innocent of any tool, unless the oilcan must rank as a tool, and the adjustment is still perfect. Incidentally I must pay a tribute to the larger tyres. My machine is fitted with the 2⅜in. size roadster pattern, and the rear cover has shown itself capable of an infinitely greater mileage than the 2¼in. size has favoured me with for many a long year. In the early spring I questioned whether the increase in tyre sizes had gone far enough, but I must admit that I have been very pleasantly surprised, though I grant there is a lot of luck in such matters.

The New Triumph Engine.

The Triumph vertical twin has been whispered about ever since a Bercley engine was seen fitted in a Triumph frame many years ago, and I take a special interest in it because a similar 4 h.p. engine, built by Werner Frères, was one of the finest little power units I ever owned. It suffered from the disabilities common to its day, for its carburetter was a terror, its ignition was as flimsy as a paper chrysanthemum, and the spares, which were so frequently required, were seldom found to fit. Do I not remember watching a man who is now a leading light, trying to reduce an exhaust valve for one of these engines to its proper bevel angle by the roadside with no other tool than a small hand file. Howbeit, that 4 h.p. Werner was a terrific power producer on the rare occasions when it was in tune, and accomplished feats in the way of speed and hill-climbing which would not disgrace any single-geared machine of to-day. O. C. Godfrey first came to the front on such a machine. So we shall expect great things of the Triumph twin, the more so as we know it to be the product of years of experiment, and to have received the preference over another type of engine which is greatly fancied by the cognoscenti.

Caps for Motor Cyclists.

I find myself in hearty accord with the grumble who can find no cap which is really suited to a moto cyclist. The heather tweed pudding basin hats are ver nice while they are new and quite wearable on a sti day after use has made their brim more pliable; bu they flap into one's eyes at speed or in windy weathe The fashionable cap of the day looks ghastly after hundred miles, for it is cut with a very full bulg immediately above the peak, and this bulge is secure to the peak by a single point stitching or press butto consequently the bulge soon assumes a kind of Trilb dent, which looks abominable. Some riders solve th problem by reversing the cap for riding purposes, bu many of us like the shelter of a peak over our eye especially in sun or rain. Ten years ago fashio were different, and I owned an ordinary 3s. 6d. twee cap, which was literally ideal for motor cycling. had a very long stiff jockey peak, and the cap prop was cut as tight as a skullcap, being entirely devoi of bulge. It looked a trifle horsey—maybe. I wo it until its neat black and white chequers were staine to a dirty greeny-grey, and, failing to obtain a dupl cate, I had it cleaned several times, until a real soaki at length caused its brim to melt. I should sugge that the ideal motor cycling cap should be cut ve tight, with something of a streamline run from peak crown, and no sign of a bulge; that the peak shoul be excessively long and stiff, perhaps built up on a aluminium base, and that the peak base, no matt what it be made of, should be curved across from e to ear to prevent its turning over backwards at spee as I have known a leather peak do before now. Th pudding basin or modified sombrero hats—I do n know their trade designation—require stiffer brims.



MORE MARRIED COUPLES WHO MOTOR CYCLE.
Mr. and Mrs. Eric Longden and their 2¾ h.p. Douglases. Mr. Longden is manager of the Pier Pavilion, Southport. His wife, being a horsewoman, prefers riding breeches with gaiters and a white dust-coat.

asional Comments.—

An American Handle-bar Security Device.

There have been many instances of failure on the t of the ordinary handle-bar locking device, more ecially in sidecar work. Neither the expander g system nor the more conventional locking clip invariably proof against the wrench of rounding a rpin bend at speed, and an American designer has ught out an interesting alternative. His handle- has two tubes protruding downwards from it, and y fit into the twin girder trusses of the front forks, that shifting is impossible. I presume that l.p.a. ely so-called—has become a thing of the past, and t nobody is any longer in danger of pulling his dle-bar upwards out of its stem? This plan should very suitable for sidecar machines, but it is to be recated on solo machines, for it would effectually vent the bar slipping round when the rider had a l, and the unfortunate wight might have to ride ne with half a crumpled bar, which is no fun at *crêpe to crede.*

Fly-away Tank Stoppers.

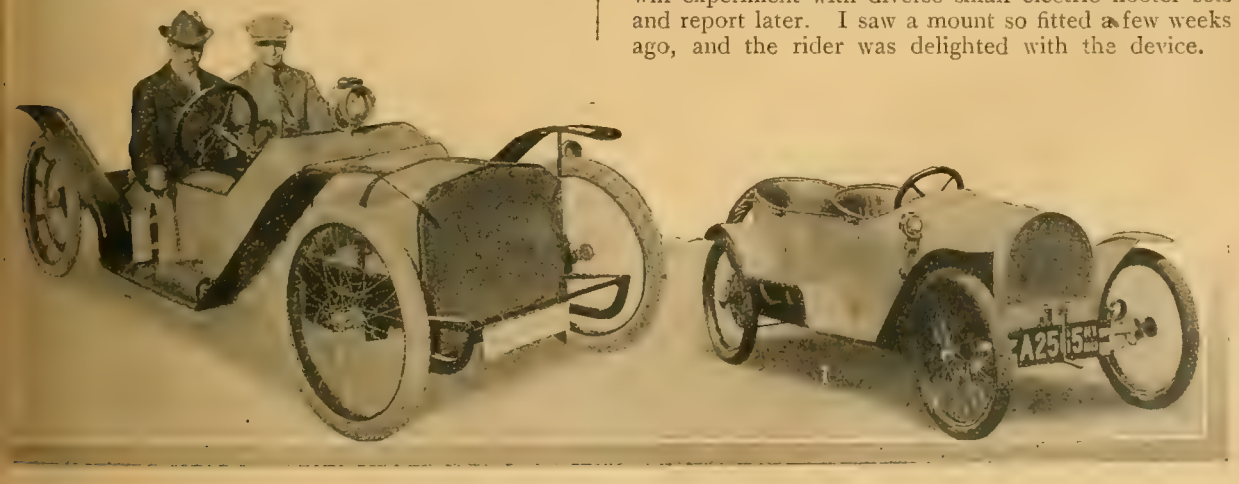
A correspondent endorses my suggestion that the r caps of some 1913 machines are designed to vide a frequent source of income to the stores artment of the factory. His machine is fitted with ing stoppers, listed at 1s. 3d. each, and one or both them flies off whenever he rides over a particularly bump. He was loath to face any substantial erial alterations, such as sweating a hinged type of r cap into his tank, and he has escaped from his ndary in a fairly simple and efficient manner, which hall imitate for my own economy. He took two es of rounded wood, half an inch in diameter, and he greatest length which it was possible to insinuate the tank. Each piece was nicked amidships, and iece of twine tied round the nick at one end and ened to the spring cap at the other end. The ng is too short to permit the stick to get endways the tank filler hole, but there is plenty of string the cap to be removed and hung out sideways ing replenishment. He states that the bits of stick it on the oil and petrol respectively and make no se, while they anchor the caps quite successfully. It is surely obvious that all filler caps should be hinged or otherwise permanently attached to the machine.

Truing a Crept Tube.

In a recent trial I saw two trade riders restore a creeping tube to its proper register in rather a novel fashion. The valve had ceased to be in true radial register by at least 30° and time was pressing. The two men were riding in concert, and noticing the threat of calamity at a check, they put the front wheel stand down, and one man got in the saddle and applied the well-adjusted front brake with all his might. The other knelt in front of the machine and pulled the cover round easily, after letting out a breath or so of air from the tube. When the valve was true again, its owner exclaimed defiantly, "Bumps or no bumps," and inflated the tyre board hard. The whole affair did not occupy a couple of minutes. With an unobservant and unresourceful duffer in the saddle, this machine might have needed a new tube before the day was over. That is an illustration of the difference in quality between the trade rider and the raw amateur. But what price standardised rims?

Penetrating Alarms.

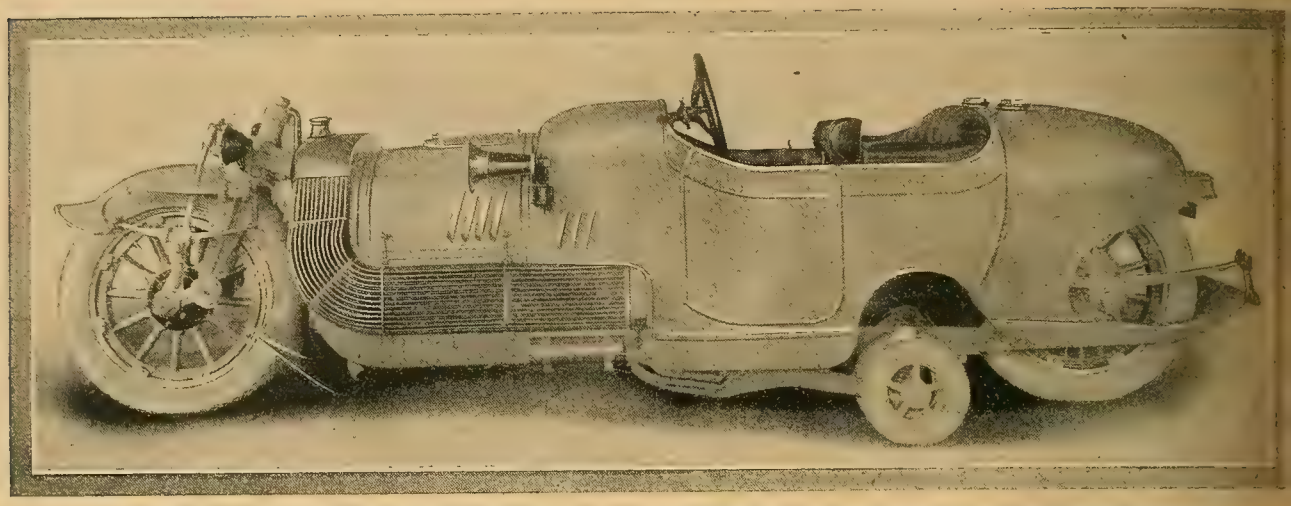
I cannot help thinking that the long distance alarm of the future is likely to be operated by electricity. From my experience—large, if incomplete—of exhaust whistles, I am inclined to think they require a very sturdy return spring, which renders them unsuitable for hand-control, and foot control is already becoming a trifle impossible now that most of us have brakes and clutch pedals to operate, and most men are limited to two legs. The motor cycle Klaxon should be easily operated, and may fill the bill: but the hands are wanted already for the steering, the throttle, and the valve lifter, which seems to make an additional *lever* somewhat of an incubus on many machines. The ideal is a small electric push-button, which could be mounted near the valve lifter, and depressed by one finger of the hand which lifts the valve. Moreover, the empty space on top of the front mudguard and in front of the fork is simply gaping for an electric horn, and there is usually plenty of room for a dry battery somewhere in the region of the saddle-pillar tube. I will experiment with diverse small electric hooter sets and report later. I saw a mount so fitted a few weeks ago, and the rider was delighted with the device.



TWO EXAMPLES OF AMERICAN CYCLE CARS.

(1) The Twombly tandem-seater, which is fitted with an air-cooled engine, chain drive and three-speed gear. These, however, will shortly be replaced by 15 h.p. four-cylinder water-cooled engine and cardan shaft drive. (2) The 10 h.p. California sociable four-wheeler, which is said to turn the scale at four cwt.

A Wonderful Two-wheeler.

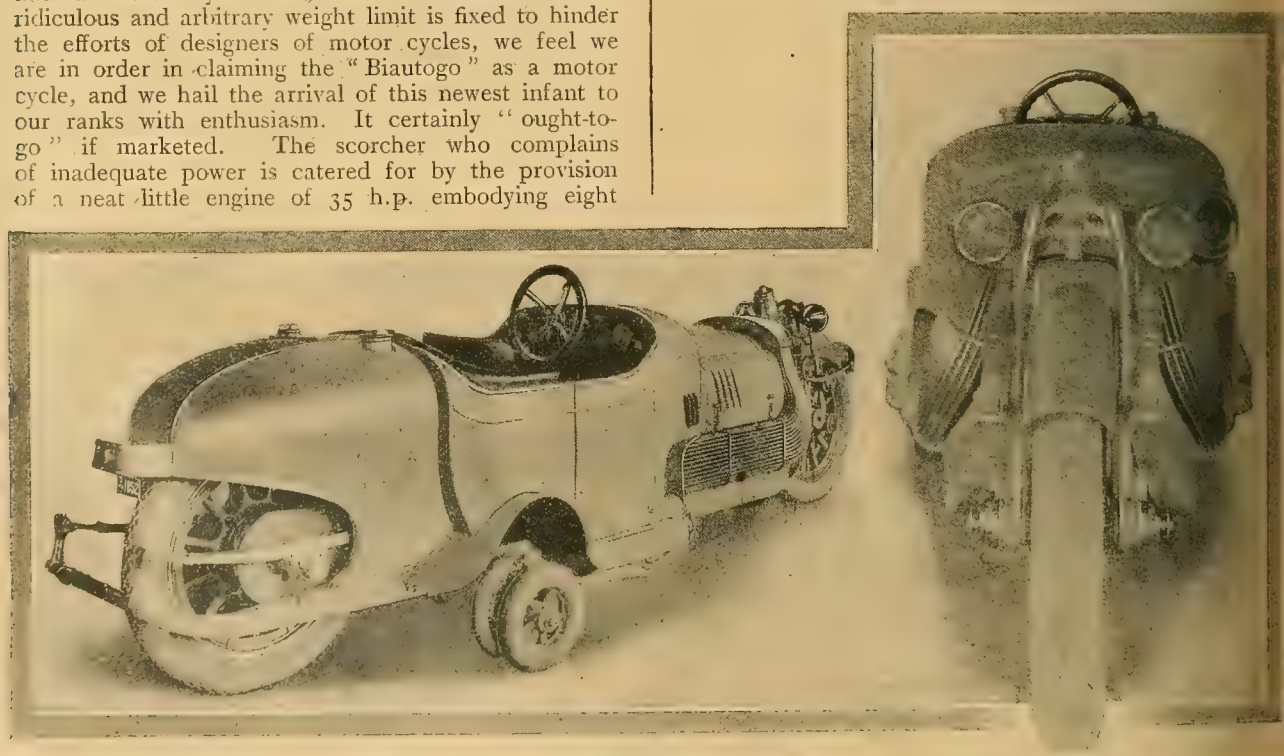


Side view of the eight-cylinder 35 h.p. Biautogo showing front and rear springing, radiators, three-seated body, and general appearance.

MR. JAMES S. BOOTH, a journalist of Detroit, U.S.A., is clearly dissatisfied with the many automobile products of the American Coventry. And as befits one who writes for the edification and instruction of the public in the columns of the press, he does not let his talents lie smouldering under a bushel, but has brought them into the light of day, and evolved an entirely new bi-car—we nearly wrote cycle car, but fear the A.C.U. would hardly pass the "Biautogo," as it is named, into the cycle car category.

But on the principle of a car having four wheels, and a motor cycle two, and furthermore as no ridiculous and arbitrary weight limit is fixed to hinder the efforts of designers of motor cycles, we feel we are in order in claiming the "Biautogo" as a motor cycle, and we hail the arrival of this newest infant to our ranks with enthusiasm. It certainly "ought-to-go" if marketed. The scorcher who complains of inadequate power is catered for by the provision of a neat little engine of 35 h.p. embodying eight cylinders set V-shape. The nervous rider in traffic or round hairpins should be reassured by the presence of a four-speed gear box, by means of which even such hills as Porlock or Amulree should lose their terrors, and clean ascents of Applecross might become a matter of no great moment on this smart little mount. Careful provision has been made by Mr. Booth against annoying tyre troubles by the fitting of 935 × 135 mm. tyres. Doubtless, the designer recognises that the removal of the wheels for tyre repair is scarcely a wayside job for an expert, let alone a novice.

Recognising that a running start might prove a



TWO ASPECTS OF THE BIAUTOGO
(1) Three quarter rear view showing underslung frame and supporting side wheels. (2) Front view showing radiators and overall width.

A Wonderful Two-wheeler.—

little fatiguing to all but the most robust, for the "Biautogo" weighs a trifle of 28 cwt., the designer has thoughtfully provided balance wheels which are let down from the driver's seat, by means of which the machine is kept on an even keel, what time the engine is started. The driver then takes his seat in front of his passengers, for the machine is considered up to the task of taking three persons in all, and lets in his clutch and sails away. On attaining a speed of 20 m.p.h. the side anchors are hauled up and the craft left to balance itself.

The sensation of a skid we leave to the imagination of our readers, but we feel rather unhappy at the thought of the control. On a four-cylinder motor cycle well-known in England it was found advisable to substitute handle-bars for wheel steering, and if this course were pursued on the "Biautogo" we think the maker would produce a very racy and powerful little mount.

To the *diletante* in engineering the study of this machine repays attention. The details are beautifully carried out, and the whole construction reflects credit on the designer and maker. But whether the vehicle can be taken seriously as a roadworthy machine remains to be proved.

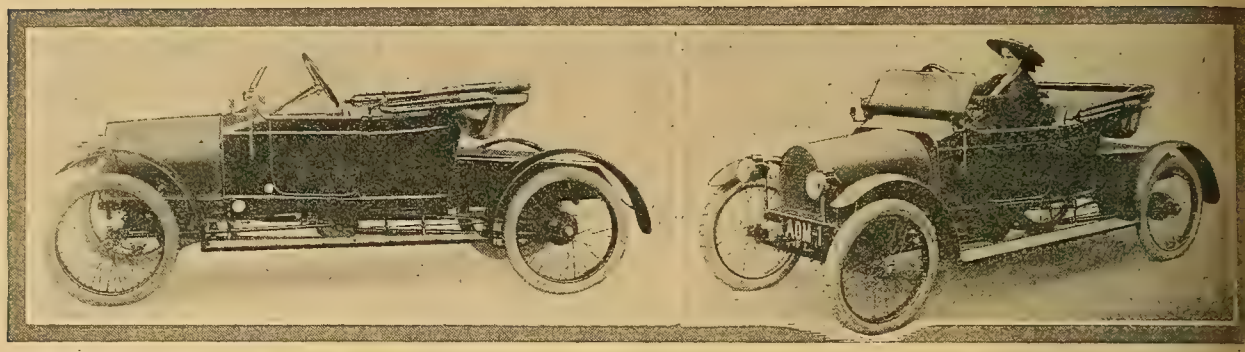
"SPARKS."

ILLUSTRATING THE GROWING USE OF THE MOTOR CYCLE IN THE ARMY.

(1) A group of despatch riders of the Artists Rifles at Abergavenny. (2) A despatch rider, C. Cecil Gates, who has covered 20,265 miles since 1911 on his Matchless in connection with the Army. (3) Members of the Lincolnshire Yeomanry at their Annual Camp at Grimsthorpe Park. The machines are a Matchless, Ivy-Precision, Campion-Jap, and Zenith. (4) The motor cycle section of the "East Lancashire Divisional Signalling Corps Royal Engineers" at their annual training at Ilkley, Yorkshire. (5) Capt. Coates (O.C.) and Lt. Swithenbank of the Hull unit of the Legion of Frontiersmen, receiving despatches from a scout who has just returned to camp.

THE CUMBRIA CYCLE CAR.

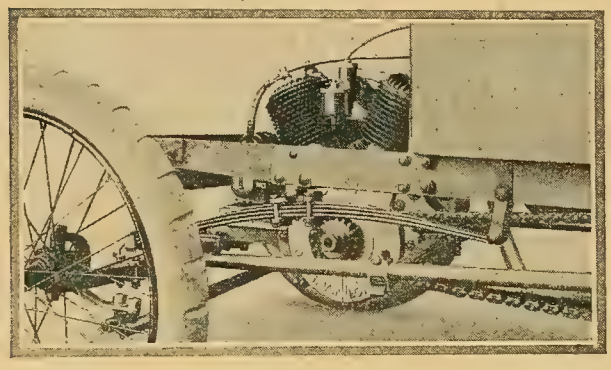
Features: Air-cooled engine, Central chain drive, Ash frame.



Side view of the chain-driven model showing hood, etc.

Three-quarter front view.

A CYCLE car of quite new and taking design has been produced by Cumbria Motors, Ltd., Cockermouth, the sale of which is handled from 13, London Road, Coventry.



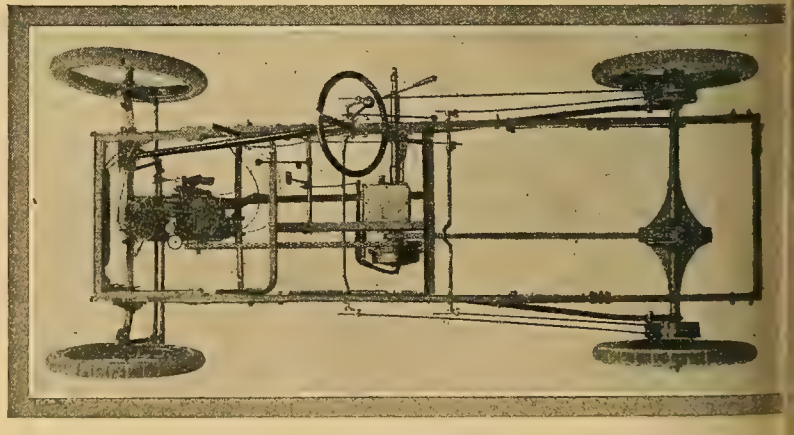
Patent suspension for the 8 h.p. engine of the Cumbria cycle car. Observe the transverse leaf spring.

It is made in two types. One is a simple machine fitted with final drive by Whittle belt to a novel design of back axle. There is no differential, but two plates in the back axle take the drive and are allowed to slip slightly when turning corners. The power is taken from the engine by a chain to a Sturmey three-speed gear, situated midway in the chassis. The power unit is a Coventry made twin air-cooled 6 h.p. engine.

The larger machine is more ambitious. The power is obtained from an 8 h.p. J.A.P. air-cooled twin motor, and thence to a three-speed and reverse gear box on car lines, on to which is bolted the large Ferodo-lined clutch, which is connected to the primary shaft and operated by a pedal. Thence the drive is taken by chain to the rear axle, which is supplied with a differential gear. The chains used are Coventry Silent chains. A cushioning device is used to soften the shock of the drive, the engine being allowed nearly or full revolution before it actually commences its wor of driving the car. The frame is of ash, supporte with steel plates, and should prove light, strong, ar supple. Inverted grasshopper springs are employe and the general details of the steering gear are we carried out. A very neatly finished celluloid-covere steering wheel is fitted.

A curious feature of this cycle car is the method mounting the engine. The fore part is attache rigidly to the front axle, and the rear end is sprun to allow it to move up and down with the axle. Th method is simple, but it obviously relies on the radi rods to the axle standing up to their work.

All mechanism is thoroughly protected by an amp underscreen, and the whole machine, fitted with a ne two-seated body, two side lamps, tail lamp, generato horn, jack, and tool kit, is priced at 122 guineas. is stated that this car has been tested over Fangs Bro in the Lake District, close to Loweswater. This h has a gradient of approximately 1 in 6. On th level it has attained a speed of close on fifty mil per hour. We are assured that the car has had severe testing in Lakeland, and has emerged mo satisfactorily.

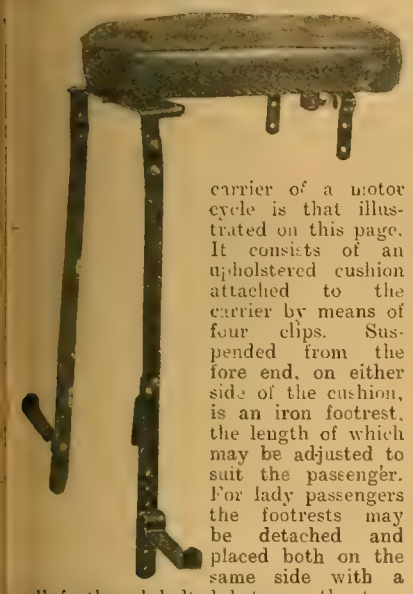


Plan view of chassis of the 8 h.p. Cumbria, showing chain drive, countershaft gear, and general arrangement.

AMONG THE ACCESSORIES.

A Pillion Seat.

Pillion riding seems to be gaining in favour. A neat seat for fitting to the



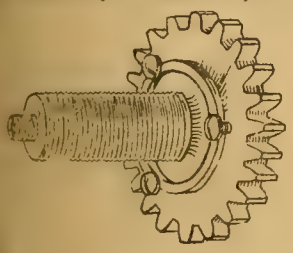
carrier of a motor cycle is that illustrated on this page. It consists of an upholstered cushion attached to the carrier by means of four clips. Suspended from the fore end, on either side of the cushion, is an iron footrest, the length of which may be adjusted to suit the passenger. For lady passengers the footrests may be detached and placed both on the same side with a small footboard bolted between the two. It is made by Frank Ashby and Co., Etna Works, Princip Street, Birmingham.

Speedometer Improvements.

Several improvements have recently been made to the Isochronous speedometer and distance recorder by its inventor, Mr. Bonniksen, Norfolk Street, Coventry. The driving gear has been doubled in strength as compared with the first model, and the flexible tube containing the driving cable is now all metal; the earlier ones had a rubber lining, but this caused the tube to shrink and placed a buckling strain on the cable.

The friction method of connecting the cable to the drive and the indicator has been superseded by a key and keyway device which is a positive form of transmission and a great advance over the older type.

To exclude water and dirt from the bearing of the driving gear a neat cup-shaped leather washer is attached to the driven wheel by a metal ring and three



screws. The cupping of the washer is specially provided to enable the hole to close as the bearing wears and the washer flattens. It will readily be seen that flattening a cup-shaped washer has a tendency to close the washer on to any part which the hole fits over.

Very shortly a trip mechanism will be introduced for this speedometer, which will consist of two extra dial openings, one to register ten miles in a circle and the other 100 miles in a circle. A button at the side of the instrument will enable both trip hands to be turned back to zero like the hands of a keyless watch.

Luggage and Tool Cases.

A handy week-end luggage-case is that made by Lomax, Ltd., William Street, Birmingham. This case is collapsible, and made of special trunk material covering three-ply boards. The size is 16in. long by 10in. wide, and when closed 6in. deep; it will, however, extend to 12in. deep. The straps are so arranged that the case can be removed bodily from the carrier without disturbing the fastenings which secure the top and bottom halves.

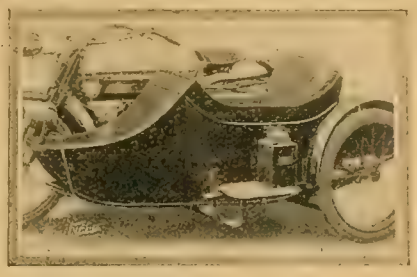
The Lomax Extensible Valise.

The case is very light, and it can be supplied in any colour to match the frame of the machine. The same firm makes a large number of articles in leather for motor cyclists' use, among them a flexible waist belt which can be shortened or lengthened by removing or replacing sections of the leather used in its construction, a waist belt to be worn by motor cyclists when carrying a passenger on the carrier, sparking plug cases, spare belt cases, and tool cases.

One of the New York motor cyclist police officers with his 7 h.p. Indian. He is stationed at the entrance to one of the famous East River bridges.

A Novel Sidecar.

The Oakleigh Motor Co., 65a, Rosendale Road, West Dulwich, S.E., has just produced a very striking looking sidecar, which we illustrate. A wind

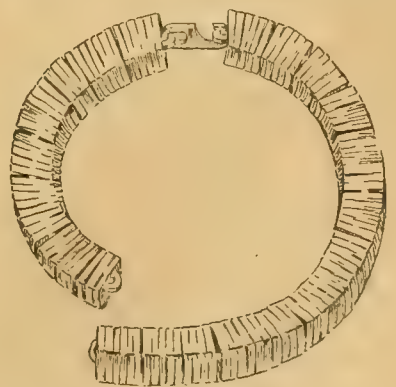


The Oakleigh wind cutter sidecar.

cutting front with a high dash, together with a novel method of suspension, are the features of this production. They are exceptionally light, being made throughout of ¼in. three ply wood, for which lightness, combined with strength, is claimed. The upholstery is padded with a patent composition, rendering coil springs unnecessary. It is claimed that the concave dash renders a wind screen unnecessary. To ensure great rigidity no door is provided to the standard sidecar, but one can be fitted if required at an extra charge of fifteen shillings. The price of the complete sidecar and tyre is £9, and it can be painted any colour to order.

A Novel Belt.

The Zilla Patent Belt Co., 82, Gt. Western Street, Moss Side, Manchester, has produced an ingenious belt that should be particularly applicable to high-powered machines or for sidecar use. The centre of the belt is composed of an endless steel chain, with the ends of each link formed as a hook, so that sections of the chain may be attached



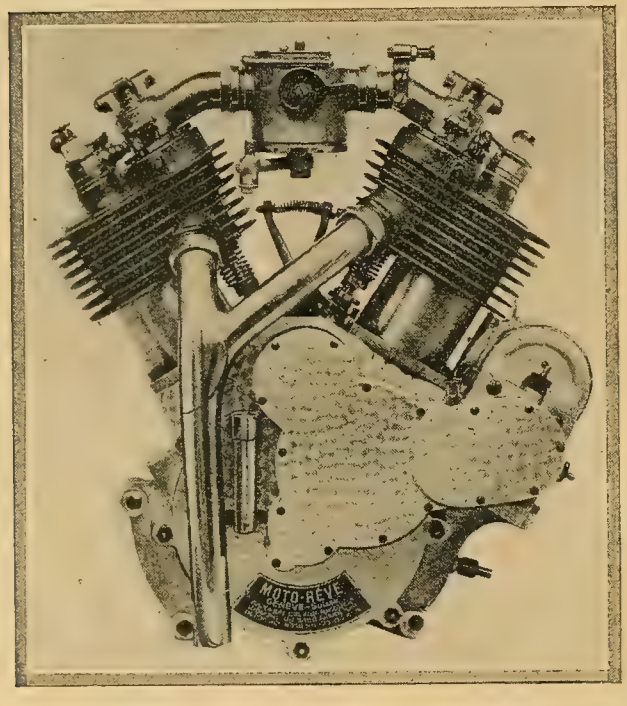
A combination chain belt.

or removed if it is desired to lengthen or shorten the belt. On this chain are forced leather pieces like thick washers cut at an angle of 28° and placed close together, but at the same time are made a sufficiently slack fit to allow flexibility. When it is desired to shorten the belt one merely pulls off a few of these leather washers and takes out a link and the job is done. The belt appears to possess great strength.

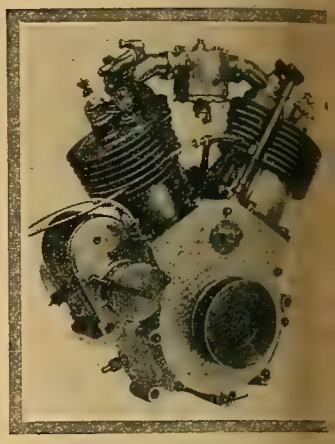
A New Model 4 h.p. Twin Moto-Reve Engine.

WE are able to illustrate an entirely new model from the well-known Swiss factory. This is a 4 h.p. twin of 63 mm. bore by 85 mm. stroke, giving a capacity of 530 c.c. The general appearance of the engine is extremely attractive, and it is characterised by high-class finish and remarkable lightness, being, in fact, almost exactly 50 lbs. in weight, complete with magneto and carburetter.

The crankshaft is carried on phosphor bronze bearings of good length, and the pistons are flat topped with three rings. The gudgeon pins are secured in a somewhat unusual manner, the pin being carried trunnions close up to the under side of the piston hea and the securing bolts passing through the piston and being secured on the top side by locking nuts.



Timing gear side of the latest 530 c.c. twin Moto-Reve.



Pulley side of the 4 h.p. twin M.-R. engin showing valve springs, adjustable tappets and overhead valve operating mechanism

A new departure in Moto-Rêve practice is the use of mechanically-operated overhead inlet valves. These are very neatly carried out, and have quick detachable operating rods on adjustable tappets, return springs being employed to prevent noise through bouncing. The plugs are placed in the cylinder hea

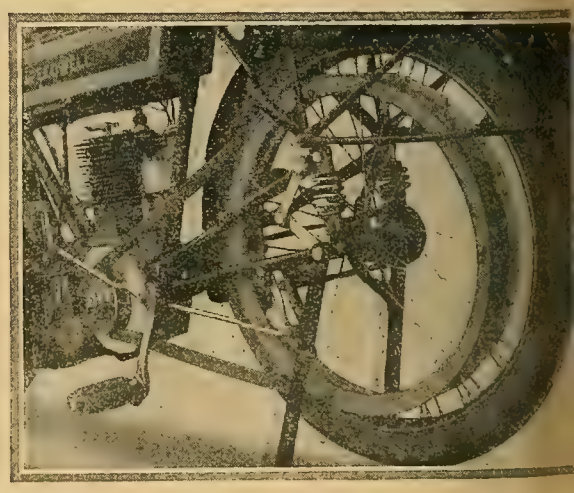
The magneto fitted is of the Moto-Rêve Co.'s ov manufacture, and is gear driven. It is carried on platform cast integral with the crank case, and t advance and retard movement is governed by a Bowd wire working against an enclosed spring. A ne feature of the Moto-Rêve magneto is the carrying the contact breaker cover on two balls to ensure ea movement and prevent binding.

Another feature is the neat way in which the exha pipes are attached to the engine. Instead of t casting being threaded externally to take the exha pipe union, it is threaded internally and a small ca iron union is threaded into the cylinder, and on to th union is attached the union on the exhaust pipe.

Altogether, the engine is a notable addition to t products of the Geneva factory.

A Rear-springing Device.

THE illustrations depict an invention in connection with the spring suspension of the rear portions of the frames of all motor cycles. The device can be fitted to existing machines with little alteration and at a low cost. It has been thoroughly tested and found to be comfortable, strong, and reliable. The tension of the belt remains the same in all positions, by reason of the fact that the radius of the spring back fork is large, and that the centres of the engine pulley, spring fork pin, and rear wheel are all in line. Lateral movement is prevented by the wide and rigid hinge at the engine, by the heavy gauge tubing of spring forks, and the three joint shackles at rear extremities of forks. The central joints of the shackles are made of large diameter, and may be tightened or slackened to adjust the flexibility of springs as required to suit the road conditions. The designer is Mr. W. B. Burnet, works manager for Messrs. Bennett and Wood, Ltd., Speedwell Cycle and Motor Manufacturers and Importers, Pitt and Bathurst Streets, Sydney.

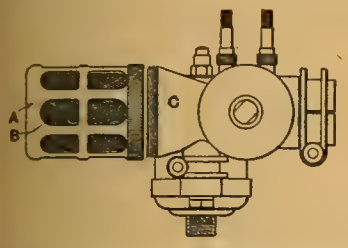


A novel method of rear springing.

PATENTS by Eric W. Walford F.C.I.P.A.

The Senspray Air Intake.

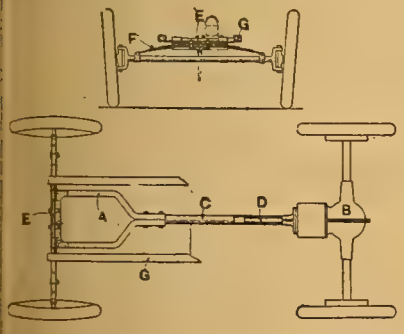
No carburetter can be considered perfect which does not effectively filter the air before its passage to the engine. Ordinary gauze discs soon become choked with dust, but the construction illustrated affords a large area for the



passage of air, so that this difficulty is overcome. The intake comprises a barrel A of skeleton form which is of sufficient length and lined internally with gauze as shown at B. The barrel screws upon the carburetter body C, and the air passing to the engine is most effectively filtered.—C. H. Pugh, Ltd., and E. W. Starkey, No. 13,064, 1912.

P.D.A. Cycle Car Suspension.

With the object of providing a simple and efficient construction, the engine



frame A is connected to the back axle B by telescopic members C D, which act as a torque tube. The engine frame is provided with a wide bearing at the front on a shaft E, below which is arranged the single transverse front spring F. The main frame members G are also mounted upon the shaft E, and it will be clear that, as the back axle rises and falls, the engine frame A will oscillate freely on its shaft.—F. W. Hulse, and Pickering, Darby, and Allday, Ltd., No. 16,217, 1912.

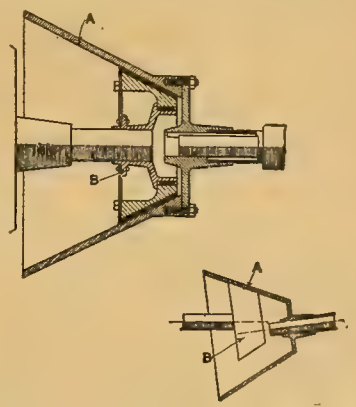
Belt Fasteners.

The illustrations show two forms of belt fastener, both of which are designed to provide great flexibility and to give a central pull on the belt. The first construction comprises merely two strips of tempered steel A B, one of which passes through an aperture in the other to give a central pull. In the second construction the plates screwed to the belt are connected by crossed pivoted bars C, and a flexible extension piece D is employed

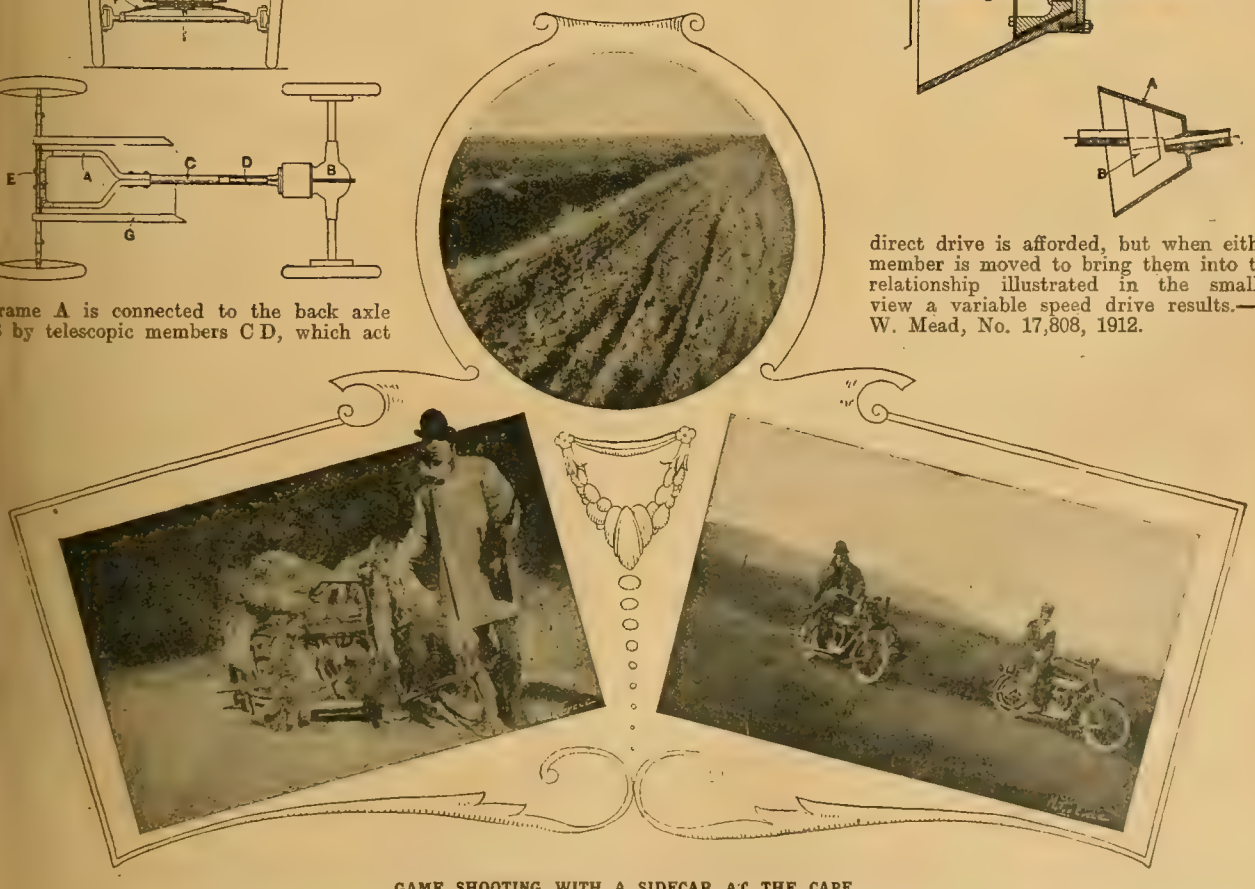
which straightens out as the belt passes round the pulley and takes some of the strain.—C. H. Gray, No. 19,860.

Friction Gearing.

In this frictional gear a large internal cone A provides one frictional surface, the other comprising a smaller external cone B. When the two cones are in the position illustrated in the larger view a



direct drive is afforded, but when either member is moved to bring them into the relationship illustrated in the smaller view a variable speed drive results.—F. W. Mead, No. 17,808, 1912.



GAME SHOOTING WITH A SIDECAR AT THE CAPE.

(1) Sample of the road with which the riders met. (2) One of the 6 h.p. Enfield sidecars loaded with some of the spoil of a day's shooting. Mr. H. Dreyer is the rider. (3) H. Dreyer and D. Garlick, of Cape Town, on the way out. The sidecar passenger took the photograph. The second sidecar carried the baggage, guns, etc. The start was made after three days heavy rain, and part of the road traversed after dusk consisted of ploughed fields which the Enfields took with all aboard.

LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Garage Charges.

Sir,—Knowing that you are always ready to take up the cudgels, when excessive charges are made to motor cyclists, I beg to bring to your notice the tariff obtaining for garage at the Great Western Hotel at Fishguard.

The charges, printed on their tariff, read thus: "Motor Cars and Motor Cycles, 2s. per day, 10s. per week."

That no distinction should be made between a 60 h.p. car and a lightweight motor cycle is preposterous, and even for my bicycle and sidecar I considered the charge excessive, and refused to pay more than a shilling for one day's garage.

The garage in question is not artificially lighted in any way, and is merely a galvanised iron erection.

P. R. HOOPER.

A Warning.

Sir,—May I through your hospitable columns issue a timely warning to motor cyclists who may during the holiday season have occasion to pass through the lethargic city of Hereford?

Of late there has been experienced a burst of phenomenal activity on the part of the police, and sympathetic magistrates have joined in the general conspiracy of persecution against the motorist. Recent cases at court have been supported by the most entertaining evidence, which would be indeed humorous were it not so effectual in securing convictions. One witness, quite recently uniquely gauged the speed of a motorist by saying that his pony could go at ten miles per hour, and the defendant, he declared, was travelling four times as fast. One marvels not so much at the hypothetical arithmetic as at the magistrates, who seriously regarded such testimony. A first offender was, a week or two ago, mulcted of £3 on such evidence as this.

C. J. HUGHES.

Fair Treatment.

Sir,—It makes me smile to see the letters on this subject sometimes published in your paper. My experience has been just the reverse. One of the firms mentioned has kept me waiting six weeks to replace a faulty bearing on a new machine. I am still without my machine, and am likely to be, as letters only bring me insulting replies. Most of my friends also agree that these "fair treatment" stories are the exception.

HAD SOME.

Sir,—There has been recently some correspondence in your valuable journal from readers, some discontented and some otherwise, concerning the treatment accorded them at the hands of manufacturers in the matter of spare parts and repairs. I should be glad if you would extend me the hospitality of your columns to mention my experience with Messrs. Singer and Co., Ltd. Recently, while travelling to Wolverhampton, the inside flange of my pulley broke away from the centre. I effected a temporary repair by having the two pieces riveted together, and wrote for a new pulley to be sent me, c/o post office, Wolverhampton. This I received by return of post. Within fifty miles this went exactly the same way. I therefore got the machine to the works, where it was found that the frame had been pulled out of line. They relined the frame and fitted another pulley, and I was able to proceed after a wait of about three hours. More recently my cylinder blew off, smashing the piston, bending the connecting rod, and driving the sparking plug through the tank. Here was a pretty wreck. I sent the machine off to Coventry on Tuesday, prepared to possess my soul in patience for some time without it, but, to my surprise and delight, I received it back on Thursday night fitted with new tank, cylinder, piston, connecting rod, and plug. All these repairs were done entirely free of expense to me. While writing, I should like to express my appreciation of their 4½ h.p. model for sidecar work. The usual disclaimer, of course, applies.

W. F. DOWSETT (AD 3171).

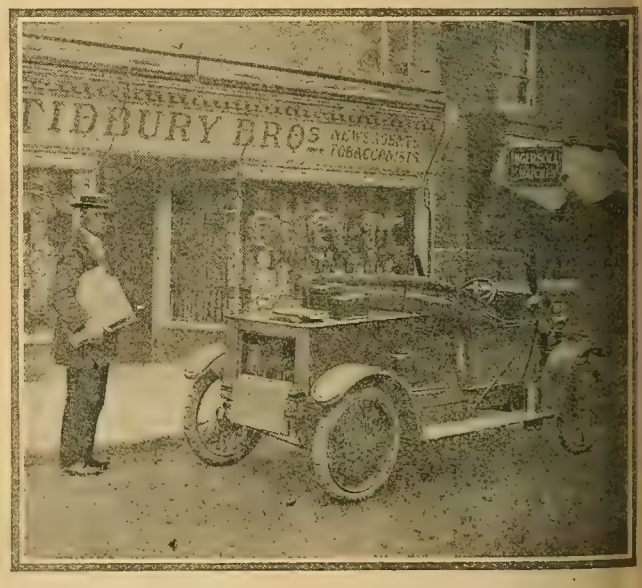
Sir,—Having often read letters in *The Motor Cycle* from correspondents complaining of the treatment they have received at the hands of some manufacturers in the matter of repairs and obtaining spare parts, I should like to give you the following instances of the way Messrs. Phelon and Moore treat their customers. A few weeks ago it became necessary to rebuild my back wheel, and I wrote to Messrs. P. and M. telling them that it was necessary for me to use my machine every day, and asking how long they would be doing the repairs. They replied two days. I sent the wheel off on Sunday evening and received it back on the following Wednesday. In rebuilding the wheel they found that the brake drum was faulty and this they replaced free of charge, although my machine is two years old. Last week I had to send my two-speed gear to be overhauled, it having done upwards of 10,000 miles. I sent this off on a Monday and it was thoroughly overhauled and returned to me on the Wednesday evening following; so that whatever the experience of others may be, for myself I cannot speak too highly of the treatment I have received from this firm. The usual disclaimer.

A. BEGBIE.

A Cycle Car with a Business Body.

Sir,—I am enclosing a photograph of my G.W.K. showing special back box for business purposes. This is the second G.W.K. I have used in this manner. On my last I did 23,000 miles in twelve months, which speaks for itself.

KT 117.



A G.W.K. provided with a box at the rear for carrying goods. (See letter from KT 117.)

Genuine Accessories.

Sir,—There is one real grievance, which has never been properly ventilated in your journal, namely, the tendency of substituting accessories, etc., for the sake of an extra profit. The most bare-faced imposition was practiced on me a few days ago when I stopped my cycle in front of a prosperous, well-stocked cycle store in a town of 150,000 inhabitants. I asked for a tin of Robbialac of a standard colour for the purpose of retouching my sidecar on the culmination of my holiday. I was obstinate in insisting on Robbialac, my sidecar having originally been painted with this enamel. This commercial pirate pledged me his family's honour that the enamel he was forcing upon me at a saving of 6d. was made by the same firm for them, and was actually the same stuff. Since then he and I know better. It would be a great boon to all motorists if manufacturers of repute would take the trouble to convince such catchpenny brigands that it does not pay to substitute nondescript quality for well-known accessories, and I trust my fellow sufferers will co-operate with me in gently and firmly refusing to be a party to such a most reprehensible practice, which, to my sorrow, is getting more and more prevalent amongst accessory dealers. MARTIN HUMBERT.

Military Motor Cyclists.

Sir,—As a Territorial and a keen motor cyclist, I should like to draw attention to several obvious flaws in the War Office scheme for Territorial motor cyclists.

In the first case, in their great anxiety to get men, the authorities are making the training of the motor cyclist a mere farce. It is quite impossible to teach a motor cyclist one-fiftieth part of his work during twenty recruit drills and only one drill per year afterwards, with the exception of the annual training. In addition, arming a man with a revolver only, and giving him twelve rounds to fire every year with it—six with each hand—is absolutely ridiculous. Personally, I believe that the motor cyclist is of very much less use than he might be if he does not carry a rifle; but if the authorities are to pin their faith to the revolver, then at least the motor cyclist should have a considerable amount of practice with his weapon, as it is admittedly a most difficult job to become proficient in revolver shooting.

The motor cyclist should have a knowledge of signalling, a thorough knowledge of scouting, and many other interesting military duties. Twenty drills the first year and none afterwards will not make him proficient, or even give him the faintest smattering of these necessary parts of his duty.

To my mind, it is obviously unfair that the Territorial motor cyclist should have to provide his own machine during training, and then when war breaks out and there is a chance of earning a little money, take his machine from him at an admittedly low valuation, and pay him only 1s. 9d. per day. Everyone who has been on military duties, on manœuvres and such like work, will agree that 8s. per day does not begin to cover out-of-pocket expenses. Wear on tyres, belts, expensive spills, and so forth, to say nothing of the machine standing out in all weathers quite unprotected from the elements, makes it quite impossible to do anything but lose heavily over each annual training. Why, on the outbreak of war, the motor cyclist should not be allowed to earn a decent rate of pay for the comparatively short time he would give to draw it only the authorities know.

Turning now to the question of the type of motor cycle which will be officially approved. The class of man that is likely to be interested in military motor cycling usually rides a T.T. machine. He may strongly object to having to fit a change speed gear to please the War Office. If the authorities are going to insist on variably geared machines surely they should also insist on the rear wheel being accessible. I have known motor cycles to be used on military work which were not fitted with either a front or rear stand, the rear wheel of which weighed over 90 lbs., and which would take three men at least three hours on the road to fit a fresh tyre to the rear wheel and refit. This is not as it should be.

I am glad to notice that the old accumulator 'bus will no longer be eligible to draw more than its actual value for a fortnight's messing about within a two miles radius of camp. This will, at any rate, remove a great grievance among keen men, who have in the past found that out-of-date worthless machines, which never did an honest day's work during the training, drew from the authorities as much as their own up-to-date machines, which, in many cases, would be working night and day.

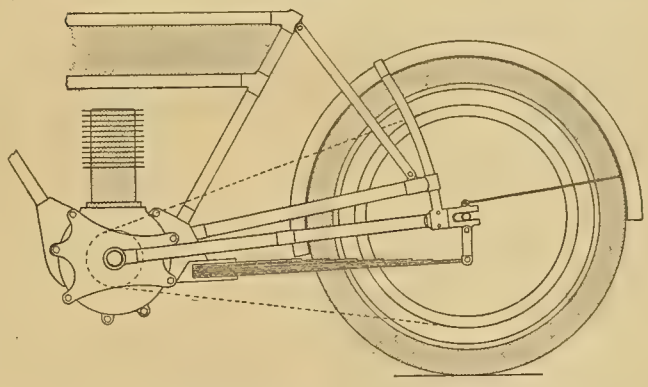
To sum up, I think—

1. That the training of the men is absolutely inadequate.
2. That the machine, in case of war, should remain the property of the owner, and that he should draw from the Government the 8s. a day which he would get on annual training, and be supplied with tyres, belts and petrol free.
3. The regulations should insist on accessibility of all parts, which is at least as necessary as the fitting of many types of change speed gears, which certainly could never survive a campaign. MOTOR CYCLE SERGT. T.F.

Rear Springing.

Sir,—I am sending herewith a drawing of a provisionally protected system of rear springing for motor cycles.

The disadvantage of all existing forms of rear springing, to my mind, is that the distance between the centres of the engine pulley and the rear wheel respectively is always varying. In those systems where the rear wheel oscillates at the end of a link, the radius of the link motion is not equal to that between the engine pulley and the rear wheel, but generally shorter, some systems, in fact, employing a very short link. When travelling over an uneven surface, therefore, the oscillating motion of the back wheel must be alternately loosening and tightening the driving belt or chain. The same effect obtains in those systems where the wheel moves in vertical guides at the end of the forks.



The rear spring frame referred to by E. W. Chalkley

This action, I think, occurring perhaps hundreds of times per minute, must have a detrimental effect on the transmission.

In this improved system, the disadvantage referred to has been done away with, owing to the fact that the radius of the motion of the link carrying the back wheel is exactly equal to that between the centre of the engine pulley and the centre of the back wheel.

For those machines having counter-shaft speed gears, the frame or link would be fitted between the centres of the final drive. The system is adaptable to springing by either leaf or spiral springs placed above or below the hub of the rear wheel. E. W. CHALKLEY.

The Twin-cylinder Triumph.

Sir,—With reference to the description which has appeared in *The Motor Cycle* relative to the twin-cylinder Triumph, the Triumph Co. wish it to be understood that this particular engine is as yet in the experimental stage. The results of these experiments do not warrant the company publishing a definite statement as regards their policy for next season.

It is well-known that the policy of this company is such that any new idea has to undergo prolonged and strenuous testing before general adoption, and the rider can rest assured that all possible safeguards are embraced before any departure from their present manufacturing policy is adopted.

The Triumph Co. have placed their faith, up to the present, in the single-cylinder machine, which type has proved itself to be one of the most efficient, and which they have successfully brought to the pitch of perfection. However, not being satisfied to rest on their laurels, experiments are continuous and diverging in all directions, in order to present eventually to the public the most perfect type of machine. TRIUMPH CYCLE CO., LTD.

Hub and Counter-shaft Gears.

Sir,—In your issue of August 14th a letter appears from Mr. Harold Bowden, of the Sturmey-Archer Gears, Ltd., in which the writer states (after criticising the counter-shaft gear as opposed to the hub gear) that it would be interesting to hear the opinions of others who have had experience of both.

Among other objections to the counter-shaft gear the writer states that the small chain from engine to counter-shaft "wears out after 1,500 miles or less, even when constantly lubricated." Now, on my own machine (a 2¾ h.p. Enfield), I have ridden well over 4,000 miles without having ever removed the small chains or even cleaned them. A half-pump of oil every 250 miles keeps both chains and gear well lubricated, and during the whole 4,000 miles it has only been necessary to adjust the chains once (not a two minutes' job).

The 4,000 miles that I have already done (and I hope to double this figure without new chains) compares more than favourably with the 1,500 or less which Mr. Bowden gives as the life of the small chain, and it would be interesting to know how he arrived at this figure.

I may add that I have not the slightest interest in the gear of which I have given my experience, and there must be thousands of riders of machines with counter-shaft gear who will laugh at the idea of 1,500 miles being the life of the small chain. A. W. EVANS.

Sir,—As a rider who has had some thousands of miles experience of both types of gear, I should like space to answer the letter from Mr. Harold Bowden in your last issue. Of course, Mr. Bowden writes as an interested party, and thus is naturally anxious to put his own case forward to the best advantage. But does Mr. Bowden ride a motor cycle himself, and, if so, has he ridden any considerable distance on gears other than his own manufacture?

Let us take his arguments *seriatim*.

I will allow him the benefit of silence, until the lower speeds get worn, when the noise of the Balkan States is eclipsed.

The small chain from the engine to the counter-shaft is much more likely to last anything from 5,000 to 10,000 miles if reasonable attention is paid to it. I should like to hear Messrs. Hans Renolds' comments on Mr. Bowden's statement that it wears out in 1,500 miles or less. I have obtained over 3,000 miles from the practically exposed chain on a Douglas, and it was good for a long way further when sold. I was a competitor in the Scottish Trials, and only saw one case of chain trouble, and that was caused by the rider running the high speed chain ridiculously slack. Messrs. Phelon and Moore have used this drive for over twelve years, and apparently are still satisfied with it, and so it would seem are the public, for the P. and M. is much sought after, with a high value new and second-hand. Chain-driven counter-shaft gears are also used with perfect success on the Indian, Enfield, Lea Francis, James, A.J.S., Sunbeam, and Scott, to mention but a few, and the transmission on these machines is as reliable as any belt-driven, hub-geared machine to be found.

The drive is only fiercer if a proper clutch is unprovided.

There is no more vibration. The Scott and Indian are both notably smooth in their drive. Has Mr. Bowden ridden either?

The fact of the matter is that the hub gear was brought into prominence solely because of the necessity of providing a change speed gear for belt drive. So long as belt drive is the fashion there will be a market for hub gears. Given careful use and constant but slight attention and frequent lubrication, they will do their work fairly well, but under severe use they are apt to complain. I have had sorry experience of them when real hard work has been required, but for an occasional help up a bad hill they are quite admirable.

Curiously enough, Mr. Bowden neglects to state the real value and strong point of the hub gear, in that it allows a high belt speed to be maintained. For this reason this type of gear is better in the hub than when put in the bottom bracket.

I should like, sir, to see the views expressed by any riders who have used hub gears and belt drive and chain-driven counter-shaft geared machines, and to hear which type they prefer.

In conclusion, let me state that I have absolutely no financial interest in either type. I have tried both types extensively with an open mind, and I know, from what I have seen and experienced, that the all chain drive counter-shaft gear has it every time. THROUGH THE MILL.

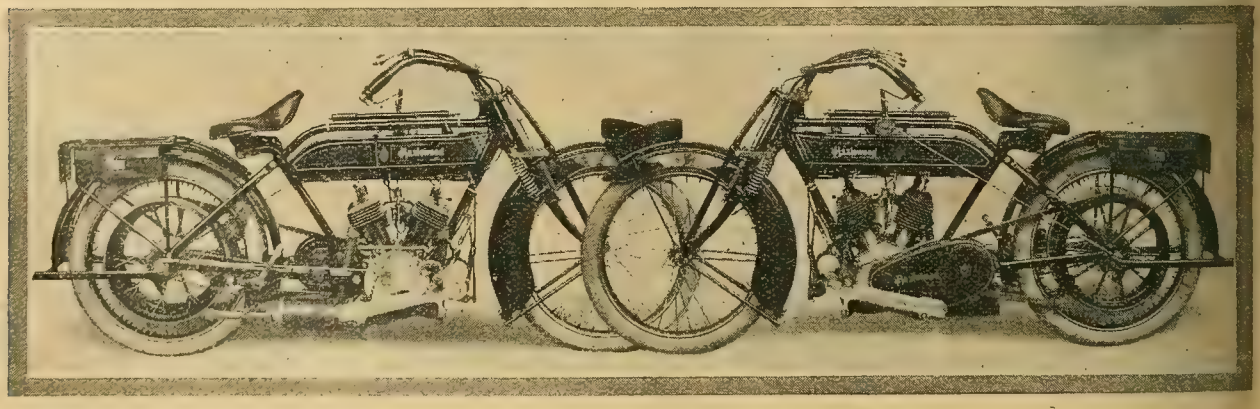
Flexibility.

Sir,—The concluding sentence of your leader on "Flexibility" strikes the keynote of what has long been the great outstanding desire of the vast majority of motor cyclists. Freak hill climbs and the desire to travel at double or treble the legal limit, with a selfish disregard of other road users, only interests a small proportion of the fraternity, chiefly the genus "K-nut."

I have been a motor cyclist from the beginning, and have ever been at a loss to understand the consummate longing for the vain glory of beating someone else by the fraction of a second, or conquering a freak hill through an unholy exercise of gymnastics.

Surely motor cycles were not built for these things, and I firmly believe if manufacturers had paid more attention to the wants of the great touring class, their best clientele, we should have had long ago the perfected lightweight, variably geared, thoroughly reliable silent motor cycle—such a machine to go fast or dead slow, as occasion arises.

I am perfectly sensible of the good that has been achieved through racing, but surely now we have sufficient data to turn to good account. W. H. STIRLING.



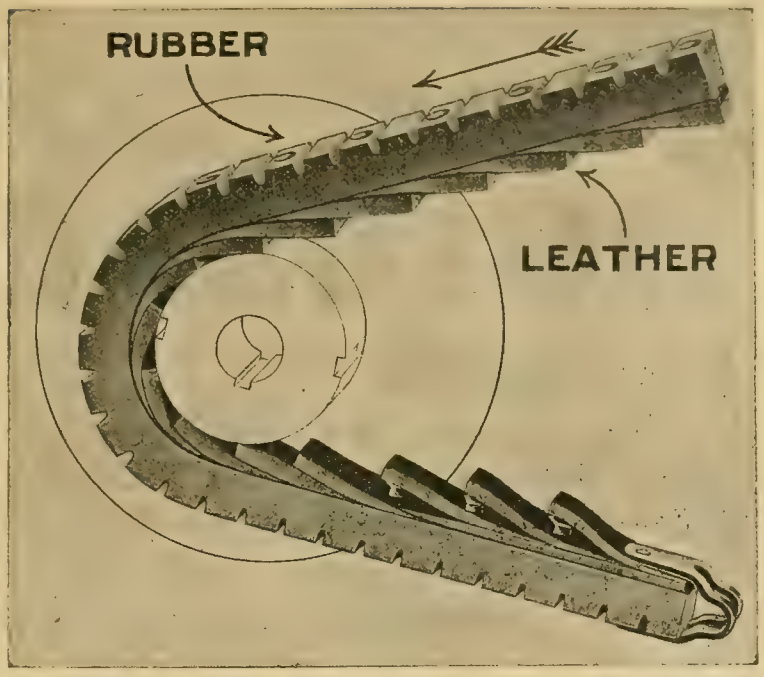
A NEW MODEL HAZLEWOOD WITH HUB GEAR IN THE SIX DAYS' TRIALS.

This machine is being ridden by T. D. Drysdale in the six days' trials. It has a new J.A.P. engine of 70 × 85 mm. bore and stroke, and is rated at 5-6 h.p. An Armstrong mark VI. gear is placed in the rear wheel and a chain driven countershaft is employed.

Lycett's

are again to the front—with a NEW improved BELT—one that, by its originality in design and exclusive practical features, completely eclipses anything else ever placed on the market.

—This Belt is built of RUBBER and LEATHER and has been expressly designed to afford greater grip, flexibility, strength, speed, long life, absolute RELIABILITY under all conditions, and particularly for use on SIDECAR and high-powered machines—The new



"RELIABLE" BELT (Rubber and Leather)

has already proved that it well merits the name of "RELIABLE"—for although it has so far been used by only a few riders—its behaviour has created quite a sensation!

—Here are some notable achievements already established, marking the *EXTREME RELIABILITY* of Lycett's Reliable Belt—proof of possession of that quality which its name implies.

SCOTTISH 6 DAYS' TRIALS: Mrs. Baxter, E. F. Baxter, J. A. Hoult, and J. F. Morrison, gained GOLD MEDALS—and each used ONLY one "RELIABLE" Belt throughout the race, which *gave no trouble whatever.*

M.C.C. STANDARD RELIABILITY and HILL-CLIMBING TRIAL, AUG. 2nd. A. T. Stanton on 3½ h.p. Bradbury, finished to SCHEDULE TIME—used "RELIABLE" Belt *untouched* throughout the run.

ENGLISH-DUTCH RELIABILITY TRIAL, AUG. 4th: S. Holloway, R. G. Charlesworth, and F. W. Barnes, gained GOLD MEDALS. P. Newbold, riding in the reserve team gained SILVER MEDAL. ALL used "RELIABLE" Belts, which *gave no trouble whatever.*

B'HAM to EDINBURGH and BACK RUN, AUG. 2-4th: H. Hopkins on 3½ h.p. Abingdon, gained GOLD MEDAL—using "RELIABLE" Belt *untouched* throughout the journey, —and this is what one of the above competitors says of the "RELIABLE":—"*You will no doubt be interested to hear how your belts behaved on my wife's and my own machines in the Scottish Trials in which we each gained Gold Medals. Well, I put both belts on absolutely new for the Trials and had not time to run them even a few miles, so naturally on the second day, I took about an inch cut of each, and thereafter during the whole trial the belts did not give a second's trouble, did not slip or pull through. We were both delighted with their behaviour and both belts are good for at least another 1,000 miles, which considering the power of the machines I consider to be excellent. I do not think it possible to obtain a stronger or more flexible belt than yours.*" *E. F. Baxter, 5, Blantyre Road, Sefton Park, Liverpool, 31st, July, 1913.*

—NOTE:—The "RELIABLE" Belt is guaranteed for 2,000 miles minimum—on our belt-testing machine it has *run four times the distance of any other rubber belt* on the market!

Try Lycett's "RELIABLE"—the guaranteed Belt!

—This Belt may cost more, but on account of its wonderful wear-resisting qualities it will outlast several of the ordinary kind of belts! Write for our new folder "A Better Belt way" which gives full particulars of this remarkable Belt.

LYCETT'S, "The Saddlery,"
BIRMINGHAM.

R.H.S.

The **MOTOR PAPERS** say that the **TWIN IS COMING**—some of them are—but the **500 c.c. 3½ h.p.**

MOTOSACOCHE

IS HERE and to those who have not had the good fortune to see and try this production—it has been since last November, and it is **UNDOUBTEDLY** the finest motor cycle that has yet been made. It has the **WONDERFUL M.A.G.** engine—the vanquisher of all makes—the winner of the **GRAND PRIX** of France. The product of a factory which has made over 30,000 engines.

THINK OF IT—and have one.

MOTOSACOCHE Ltd., Kenmont Works, College Park, Willesden Junction.

Telephone—1092 Willesden. Telegrams—"Motosacoche, London."

For the convenience of tourists the size of the book has been made suitable for the pocket or valise.

Know your road before you start.

It will save much time and discomfort.

"The Motor Cycle" Route Book contains carefully selected routes for the whole of the British Isles, with distances clearly shown; 45 Sectional Maps and Index Map (by Bartholomew), Speed Limits, and a copious index.

In every case the BEST route—and not necessarily the shortest—has been chosen. Large towns, congested districts, and bad roads are avoided.

Before commencing a tour every motor cyclist should study this book carefully. He will be well repaid by the added enjoyment which comes of freedom from worry.

Price 1/6 net. **By Post 1/9.**

Obtainable from ILIFFE & SONS LTD., 20, Tudor Street, LONDON, E.C.

And from all Booksellers and Bookstalls. *(Remittance should accompany orders sent by post.)*

A Grumble.

Sir,—I have noticed in your paper lately letters regarding generous treatment received from motor cycle manufacturers, by motor cyclists; my experience is just the reverse. I have had my motor cycle laid up for over three weeks at the motor cycle depot of one of the best known firms in the trade, and all that it wants is a new pair of handle-bars. Also, a friend of mine has forwarded plates from free engine clutch to another well-known firm for repairs, but is unable to obtain any acknowledgment of their receipt by the firm. Such treatment is in direct contrast to that cited by your other correspondents, and is calculated to do the trade great harm.

J. H. ROWE.

The Carburetter for Scotts.

Sir,—The continual enquiry in your columns for experience of the Binks carburetter fitted to the two-stroke Scott, and the great amount of satisfaction I am deriving from such a fitting, prompts me to write you on the subject, and by publishing my letter you will receive the thanks of more than one rider of this fascinating machine—of that I feel sure.

I have owned and ridden 1911, 1912, and (now) 1913 Scotts, and can, therefore, lay claim to at least an ordinary knowledge without presuming to be an expert. It is not my intention to "air" what I consider are the "shortcomings" of the Scott carburetter. Scott riders are fully alive to what they can and cannot do, and will gather from the following details whether the Binks effects any improvement.

Starting is infinitely easier, usually the third kick when cold—always the first and lightest of digs when warm.

The note of the exhaust is crisper, though quieter.

In free position, on the pilot jet (No. 3), the engine can be throttled down to a mere "tick over," equal to any four-cylinder car; counting the explosions is a simple matter.

Traffic can be negotiated at a walking pace without the slightest sign of a misfire and the consequent explosion in the silencer; in fact, one can ride so slowly that balancing becomes a difficult matter.

With an empty sidecar attached I can circle continuously with the steering fully locked inside a 10ft. circle—this with the sidecar inside and the engine firing perfectly evenly. On opening to the main jet (No. 4) the engine instantly accelerates and answers to every minute movement of the throttle—there is, however, no racing away on the level for no apparent reason—the speed remains constant.

There is no loss of power, petrol consumption 50-60 m.p.g. solo, engine runs cooler, and much more under control.

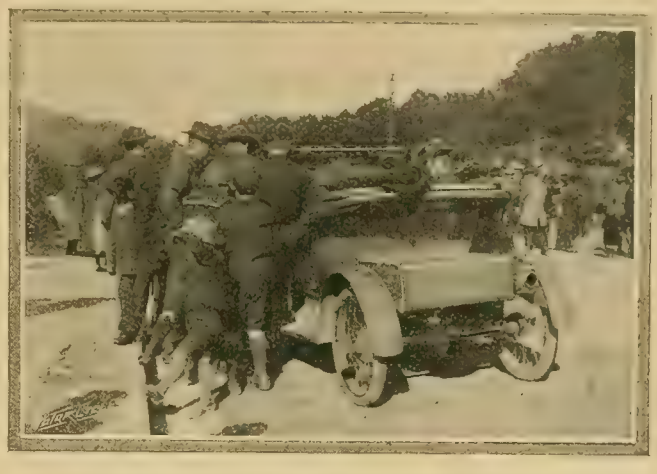
Since fitting the Binks I have enjoyed my Scott considerably more than before, and have ridden solo more during the past three months than the last three years put together, simply because I now drive the machine instead of the machine driving me. I have no interest in the firm of C. Binks, Ltd., but have always found them most attentive and obliging.

R. F. G. KELLY.

On Friday last His Highness the Kabaka of Buganda, who is on a holiday in this country, visited the works of the Triumph Cycle Co., accompanied by his tutor and three members of his suite. His Highness mentioned that he knew the Triumph machines very well, as a large number of them are in use in his country. Our photograph is of His Highness and suite and Messrs. M. J. Schulte and C. W. Hathaway, taken on arrival at the works.

Cycle Cars in New Zealand.

Sir,—Having been a regular reader of *The Motor Cycle* for some long time past, I should like to mention that the hints and tips which *The Motor Cycle* always contains are very helpful to the motorists in New Zealand.



An 8 h.p. Humberette in Wellington (New Zealand) where it is attracting considerable attention. See letter from H. W. Abbott.

The enclosed photograph, which was taken recently in Wellington, gives you some idea how interested the general public are in the Humberette cycle car, which seems to be getting a good hearing in New Zealand.

Wellington, New Zealand. H. W. ABBOTT.

Benzole and Plug Points.

Sir,—I have recently taken to using benzole. I found that after about 600 miles the knife edges of the electrodes of my Bosch plug were quite burnt away. The same plug had previously given long and excellent service on petrol, with no sign of burning, and a previous plug of the same make was only twice out of the cylinder in 2,500 miles, also on petrol. Further, two of my friends, one on a Douglas and the other on a B.S.A., have had exactly the same trouble with the same knife-edged plug, running on the same benzole. Perhaps some of your readers could suggest from their experience whether the fault lies in the plug or the benzole. I ride a Rudge, with 1913 Senspray, and have not been bothered with overheating since trying the benzole.

C.R.J.

Tyres and Tyres.

Sir,—I was much interested in a letter appearing in a recent issue from a correspondent who appears to have been most unfortunate in his tyre luck, the more so as his experience is the exact opposite of mine. With a friend riding pillion I have recently covered about 2,050 miles, mostly in Scotland, and a good bit on the West Coast. Our total weight with luggage (affixed behind the pillion seat) was 604 lbs., which put a pretty good strain on the back tyre (a heavy Dunlop non-skid). We only changed covers from precautionary motives about 150 miles from London on our return, as we were rather pressed for time. The tyre had previous to this ride run about 1,000 miles, nearly all with a pillion passenger. I must say I feel very satisfied, as the condition of the West of Scotland roads has to be seen to be believed, and, moreover, we managed to strike the Pass of Glencoe a few days after a very severe storm.

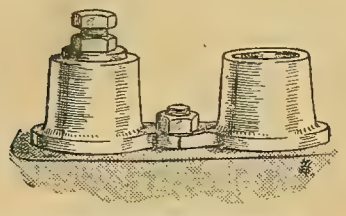
A word in praise of our mount, a 1913 3½ h.p. James, belt drive with Sturmey hub, which never faltered over the whole 2,000 miles, although taken over some pretty stiff hills, including Berriedale (in Caithness), Glen Affaric to Glen Urquhart (on the borders of Ross and Inverness, a most lovely district, that deserves to be better known), and Red Bank between Grasmere and Langdale in the Lake District; this last the worst hill we had.

By-the-by, I used benzole in the Lake District, originating, I believe, from Maryport, and found it delightful to drive on, it being impossible to make the engine knock. The engine would not, however, take as much air as with petrol.

WELL CONTENT.

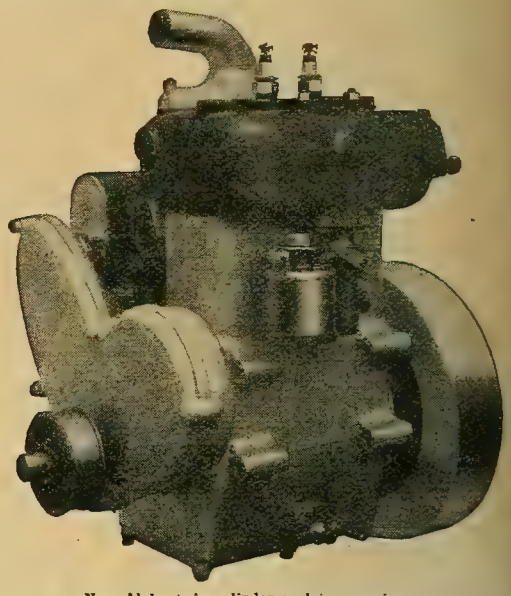
A New Water-cooled Cycle Car Engine.

MESSRS. Johnson, Hurley, and Martin, of Gosford Street, Coventry, whose name is already well-known as engine manufacturers, have recently designed and built a very simple and well-constructed cycle car engine. It has two vertical cylinders cast together having a bore and stroke of just under 86 mm. × 95 mm. respectively, giving a capacity of 1,099. The casting is a very neat one, and comprises, beside the water jacketing, both inlet and exhaust pipes. The valves are disposed all on one side, and are carefully enclosed in an aluminium cover plate, the tappets are adjustable and operated through rollers. On the opposite side to the valves is mounted a Bosch high tension magneto driven by an enclosed silent chain. Lubrication is by splash, the oil being fed in through the timing gear, and inclined baffle plates cast below the cylinders carry away the surplus oil. One of the most noticeable features of the engine is the simple and workmanlike design from a constructional point of view. The two-throw crankshaft is inserted through the rear end of the case and carried in die-cast white metal bearings.



Method of securing valve guides on the Alpha engine.

A flanged fitting is employed for the flywheel, and to enable this feature to be retained with the peculiar crank case design the rear end-plate of the case is made in two parts. A Solex carburetter is supplied, and the unit complete without flywheel weighs 105 lbs., the standard flywheel weighing 41 lbs.



New Alpha twin-cylinder cycle car engine.

Leaders' Times in the Six Days' Trials.

THE times at which the leaders may be expected at various points on the last two days, Thursday and Friday, will doubtless be of interest to our Northern readers who may be on the look-out for the men at the various points of vantage.

To-day the leader leaves the Drill Hall, Carlisle, at 8 a.m., and is due at the lunch stop at Durham at 12.10. The first man should pass Carlatton at 8.30 and be at the top of Hartside between 9 and 9.15, Alston 9.30, St. John's Chapel 10.15, Stanhope 10.40, and Lanchester 11.40, will see the leaders on their way to Durham. After lunch, the first man will leave at 1.40, and after passing Wolsingham at 2.25 should arrive at Stanhope 2.40, where a thirteen mile non-stop section is entered upon, terminating at Middleton-in-Teesdale at 3.19. Alston should be reached at 4.25, and at 5.13 the leaders run into a non-stop section commencing at Hallbank gate and extending to the finish at Carlisle, where the first man should check in at 6 o'clock, followed by the others at half-minute intervals.

To-morrow (Friday) is the last day of actual riding in the Trials, and as it is the longest as regards mileage of the whole week an early start will be made, the first man being sent off at 7 from Carlisle. At 7.50 he should be at Penrith and at 8.20 on Shap, and 9.10 should see the commencement of the run through Kendal. Underley Hall, where the speed trials are to be held, ought to be reached at 10.0, and at 11.10 a non-stop run is begun from Sampool Bridge to the summit of Gummer's How Top, 11.40. The leader is due on Kirkstone Pass just before four o'clock. After climbing Dacre Bank (4.45) Carlisle should be reached at 5.50. It must be remembered that the times given are for the first man, and the whole procession may take nearly an hour and a half to pass any given point.

NON-STOP RELIABILITY TRIAL IN HOLLAND.

The above event, organised by the Dutch A.C. for cycle cars and small cars, started on Tuesday, August 12th from Amsterdam, the first stop being Hertogenbosch for lunch. This part of the journey was over very bumpy and rough roads. Thence the route lay to Maastricht, the riders having to cross canals and rivers in ferry boats. The last twenty miles of the day's run was on a very good and absolutely straight and flat road, making a total distance for the day of 150 miles.

The second day's run consisted of a hill-climbing tour through Limberg and up to the highest point in Holland. The hills were of moderate gradients, but long, and did not cause much trouble. The journey was 100 miles.

The third day's run was from Maastricht to Scheveningen, *via* Venlo, Nizmegen, Arnheim, Apeldoorn, Utrecht, Leiden, and Den Hague. The distance was 208 miles; rather much for one day with roads for about 160 miles all setts and very rough. This was a very severe trial for chassis and springs. The best performances were put up by the following: Humberette, Morris Oxford, Singer, Baby Peugeot, and Eijsink.

THE EXAMINATION AND SEALING AT THE SKATING RINK.

Work began at 9 a.m. on the morning f the 17th inst., when the skating rink as opened. The building makes a apital garage. It is well lighted and ..my, the only drawback being the valuble maplé floor, which is some cause of nxiety to the A.C.U. officials, as they re responsible for any damage which may happen to it. To obviate this heaps of sawdust are placed under each machine together with two trays to catch any drops of oil which may fall. Every machine had its allotted place, so that there was no confusion. Outside there is a large open space, and as the building lies just off the main road the position is altogether ideal. As the machines arrived they were wheeled into a shed open at both ends where petrol was served out to the drivers. The men then proceeded to the weighbridge hard by where they lined up and were weighed one at a time, machine first and driver afterwards. The arduous duties of weighing marshal

(Contd. on page 1095.)

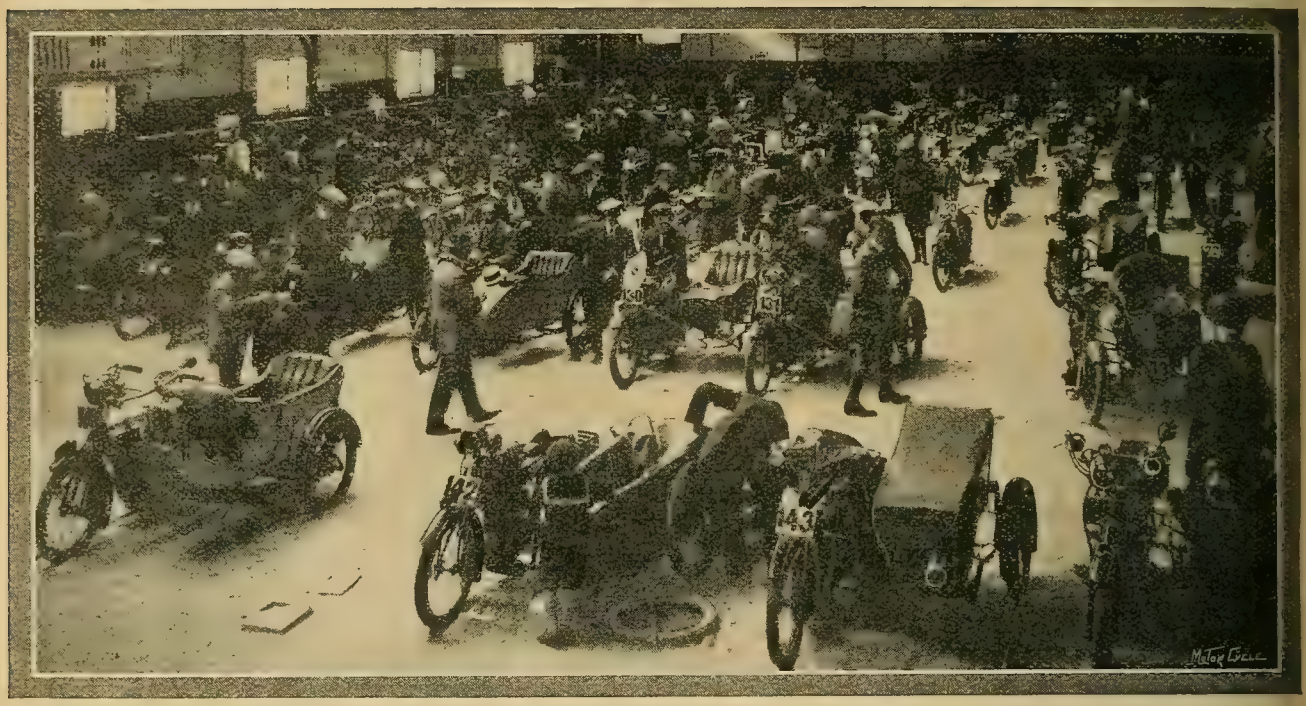
(2) One of the Nut-Japs with side by side valve engine.



The scene in the Skating Rink, Carlisle, on Sunday, during the examination and sealing of machines.

COMPLETE LIST OF STARTERS.

Below we give a complete list of starters. It will be noticed that the numbers do not in all cases run consecutively. This is because some of the competitors have made alterations in the specifications of their mounts or are not riding the machines originally entered, and these changes have put them in a fresh category, whilst retaining their original allotted number. No. 28 did not start.

DIVISION 1.—MOTOR BICYCLES.

Class B.—350 c.c.

1. C. Percival (2¾ Douglas).
2. Jas. B. Sproston (2¾ Sunbeam).
3. A. G. Cocks (2½ Connaught).
4. P. Phillips (2¾ Douglas).
5. F. G. Edmond (2¾ Humber).
6. E. Gutgemann (2¾ Veloce).
7. T. C. de la Hay (2¾ Sunbeam).
8. W. R. Steel (2¾ Sunbeam).
9. F. G. Ball (2¾ Douglas).
10. Tom Knowles (2¾ Humber).
11. F. L. Bassett (2¾ Sun-Villiers).
12. Albert Milner (2¾ Levis).
13. Howard Newey (2¾ Levis).
14. P. W. Moffat (2¾ Douglas).
15. W. B. Gibb (2¾ Douglas).
16. M. Guilloreau (2¾ Clément).
17. A. I. Sproston (2¾ Clément).
79. C. E. Murphy (2¾ Douglas).

Class C.—500 c.c.

18. W. J. M. Sproulle (3½ P. & M.)
19. G. D Hardee (3½ Triumph).
20. T. J. Ross (3½ Triumph).
21. Fred Dover (3½ Premier).
22. J. H. Kerr (3½ N.S.U.)
23. Albert E. Catt (3½ Triumph).
24. S. Sawer (3½ Premier).
25. F. W. Applebee (2½ B.S.A.)
26. W. C. Drake (3½ P. & M.)
27. P. Shaw (3½ P. & M.)
29. Maurice C. Breese (3½ B.S.A.)
30. F.E.G. Bartlett (4-5 Endurance)
31. C. B. Moss-Blundell (3½ Green-Precision).
32. H. V. Colver (3 Enfield).
33. E. Keyte (3 Enfield).
34. H. Graham Dixon (3½ James).
35. J. Ingham (3½ Veloce).
36. S. Tubb (3½ Humber).
37. T. B. G. Vale (3½ Rover).
38. G. E. Cuffe (3½ Premier).
39. W. E. Cooke (3½ A.S.L.)
40. S. Browne (3½ James).
42. F. C. North (3½ Ariel).
43. J. M. Ritchie (3½ Rudge).
44. Herbert Bar (3½ Triumph).
45. J. Oughtred (3½ Premier).
46. I. S. Holroyd (3½ Rosacoche).
47. W. B. Little (3½ Premier).
48. C. O. Roberts (3½ Blackburn).
49. W. H. Longton (3½ Alldays).
50. H. F. Edwards (3½ B.S.A.)
51. L. Newey (3½ Ariel).
52. K. A. Macdonald (3½ Singer).
53. W. Maurice Greenwood (3½ New Imperial).
54. H. Taylor, jun. (3½ B.S.A.)
55. A. C. F. Andrews (3½ Ariel).
56. Vernon Busby (3½ Ariel).
57. R. S. Scoon (3 N.U.T.)
58. G. E. Keel (3 N.U.T.)
59. James Robinson (3 N.U.T.)
60. J. Hoult (3½ Matchless).
61. H. Berwick (3½ Hampton).
62. T. B. Westmorland (3½ Premier).
63. H. C. Mills (3½ Zenith-Green).
64. Sydney J. Hine (3½ Humber).
65. D. M. Brown (3½ Rover).
66. G. J. Francis (3½ Lea-Francis).

68. L. Sealey (3½ B.S.A.)
69. A. G. Fenn (3½ B.S.A.)
70. D. H. Noble (3½ Rover).
71. G. Featherstonhaugh (3½ Rover)
72. C. T. Newsome (3½ Rover).
73. T. Pollock (3½ James).
74. C. Lester (3½ P. & M.)
75. M. Gabriel (3½ Clément).
76. Rex G. Mundy (3½ Triumph).
77. G. J. Shemans (3½ Triumph).
78. W. Westwood (3½ Triumph).
80. A. W. Walden (3½ Premier).

Class D.—750 c.c.

41. Ellison Hawkes (5-6 Rudge).
81. J. A. Neumann (5-6 Rudge).
82. Ian P. Macdonald (4½ Norton).
83. G. T. Gray (5-6 Rudge).
84. H. W. Teeton (3½ James).
85. H. E. Ashley (4 L.M.C.)
86. Dan Bradbury (4 Norton).
87. Ray. Drinkall (4½ Quadrant).
88. J. J. Day (3½ Bradbury).
89. Gordon Castognoli (4 L.M.C.)
90. L. A. Bees (4 L.M.C.)
91. Fred W. Roberts (5-6 Rudge).
92. H. Blamire (5-6 Hazlewood).
93. F. H. May (5 A.J.S.)
94. A. W. Brittain (3½ Bradbury).
95. G. W. Braithwaite (5-6 Rudge).
96. P. Platt (3½ Bradbury).
97. H. E. Haswell (3½ Bradbury).
98. George Hunt (5-6 Campion).
99. H. J. Beal (4 L.M.C.)
100. J. Richard (4½ Sun-Precision).
101. J. D. Drysdale (5-6 Hazlewood).
102. A. T. Stanton (3½ Bradbury).
120. Jesse Baker (3¾ Scott).
124. F. A. Applebee (3¾ Scott).
125. J. Norman Longfield (3¾ Scott)

Class E.—1,000c.c.

103. J. Douglas Morrison (5-6 Bat).
104. H. H. Hutchinson (6 Trump).
105. E. A. Colliver (7 Indian).
106. B. Alan Hill (7 Indian).
107. S. T. Tessier (5-6 Bat).
108. J. R. Alexander, jun. (7 Indian).
109. G. A. Gregson (6 Bat).
110. J. V. Edge (6 Brough).
111. A. Sumner (8 Zenith).
112. J. Haslam (6 Zenith).
113. H. Jepson (8 Zenith).
114. C. W. Smith (5-6 Bat).
115. J. F. Morrison (5-6 Bat).
116. R. E. Townshend (6 Trump).
117. E. H. Lees (8 Zenith).
118. M. Hands (8 Williamson).

DIVISION 2.—SIDECAR COMBINATIONS OR 3-WHEELED CYCLE CARS

Class G.—500 c.c.

119. H. C. Marston (3½ Triumph).

Class H.—750 c.c.

121. Hugh Gibson (3½ Bradbury).
122. A. J. Stevens (6 A.J.S.)
123. D. Bell (6 A.J.S.)
126. R. C. Davis (5-6 Clyno).
127. Philip Grout (6 A.J.S.)
128. Thomas Stevens (3½ James).
129. Cecil Duplock (6 A.J.S.)
130. Rex Pearson (5-6 Clyno).
131. Claude Freeman (5-6 Clyno).
132. J. A. Poxon (3½ Bradbury).
133. George Wray (5-6 Clyno).
134. George Nott (5-6 Clyno).
135. A. D. Arter (4½ James).

Class I.—1,000 c.c.

136. C. H. R. Norrington (6 Enfield).
137. H. Greaves (6 Enfield).
138. W. H. Eggington (6 Enfield).
139. Fred Crosthwaite (8 Matchless).
140. J. Chater-Lea, jun. (8 Chater-Lea).
141. E. B. Glisson (8 Wall trica-).
142. Denis Buckley (8 Matchless-Precision).
143. Fred Turvey, jun. (6 Enfield).
144. Victor Garland (8 Chater-Lea).
145. T. Silver (7 Quadrant).
146. W. Land Dibb (6 Rex).
147. C. R. Collier (7-8 Matchless).
148. R. E. Guest (7-8 Matchless).
149. T. Rutherford (7-8 Matchless).
150. H. F. S. Morgan (8 Morgan).
151. Doug. Alexander (8 Williamson)
152. J. B. Blackbourn (8 Morgan).
153. R. A. Rhodes (6 Wulfruna).

DIVISION 3.—CYCLE CARS.

Class K.—1,100 c.c.

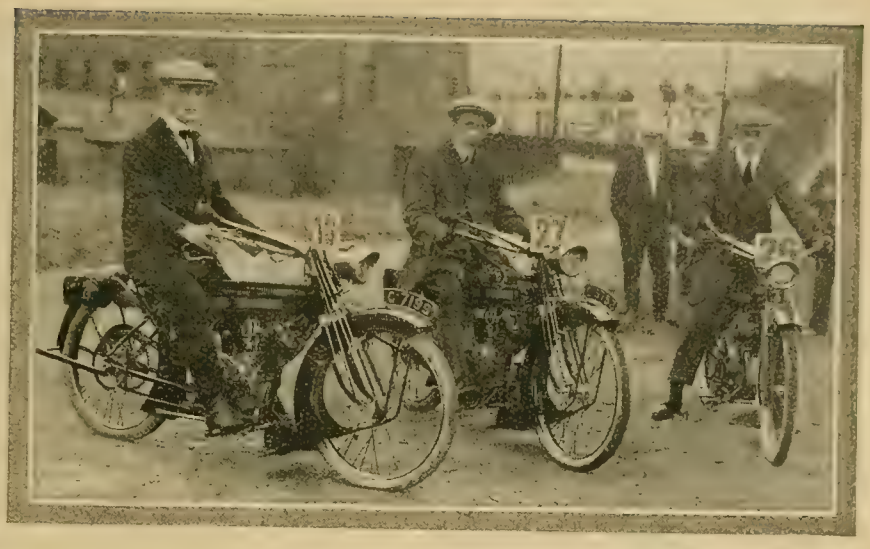
154. F. K. Portway (9 Paragon).
155. P. D. Walker (10 Harding and Summers).
156. C. M. Keiller (8 G.W.K.)
157. W. Chater-Lea (8 Chater-Lea).
158. Alan T. Tamplin (8 G.W.K.)
159. Lionel Martin (10 Singer).
160. E. B. Slater (8 J.B.S.)
161. R. Bourbeau (8 Bedelia).
162. W. Cooper (8 Humberette).

.C.U. Six Days' Reliability Trials.

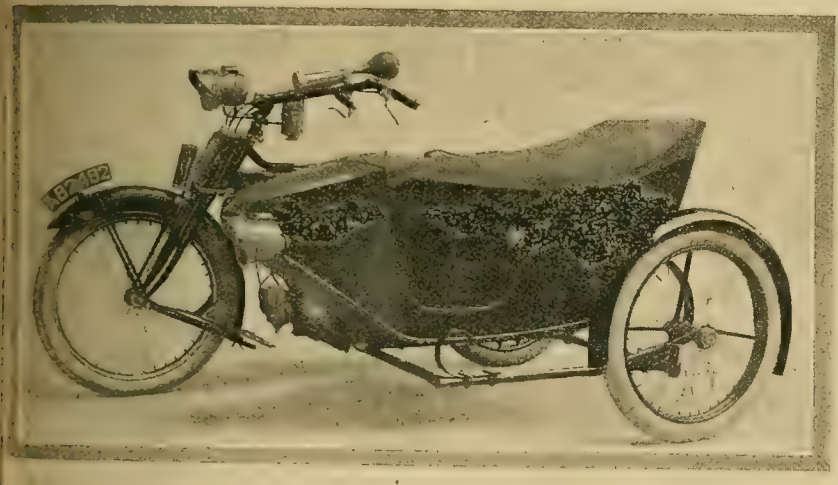
ere undertaken by Mr. S. W. Philpott, ho worked extremely hard. When this eration was over the men went back to e skating rink and there took up their llotted positions, which were indicated them by Mr. Otto Thomas.

The Sealing.

The sealing then took place. Seals ere placed on the frames, gear boxes, d engines. The wires were placed in osition by the competitors and then e seals were affixed by the officials. he only difficulty was the sealing of ch gears as the P. and M., Enfield, and lotosacoche, and where these could not e satisfactorily dealt with some im-ortant integral part, such as a wheel, as sealed. Each man had a card, and each operation was performed it was gned by the official in charge. The ems marked thereon were, sealing, eighing, etc., and when all was complete e whole was signed by Capt. Davidson, e only judge who had turned up at the me of writing. Inside the skating rink ute cards, luncheon ticket coupons for e whole week, celluloid route card pro-



THE P. & M. TEAM.—Left to right, Sproule, Shaw, and Drake.



A new Enfield sidecar combination with underslung sidecar frame and spring handlebars. It is being driven by H. Greaves.

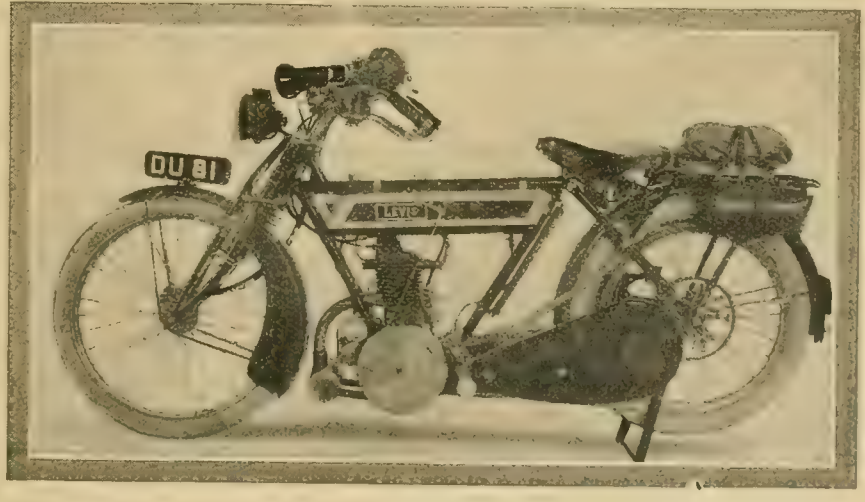
ctors, numbers, and armlets were doled t by Mr. H. P. Beasley, who was ably sisted by Mr. F. Davies.

Spare Parts.

Messrs. Ebblewhite and Glazebrook rformed the duties of customs officials examining tool bags for spare parts. ll genuine spares, such as valves, kets, cams, timing wheels, etc., had be declared, and sealed up in packets, hich will be examined at the conclu-ion of the trial. Spare tubes, plugs, elt fasteners, and such parts as were t actually component parts of the achine, were allowed. Some of the iers had a wonderfully complete assort-ent, and in one case we saw a com-lete spare magneto, and in another we en heard of a spare connecting rod, hile as a contrast others carried no pares at all. It is interesting to note hat this year Mr. Ebblewhite has worked ut the times on the route cards for each ndividual competitor, thereby saving ach man much trouble and anxiety. ven in these early stages the organisa-tion has been excellent, and the only dissatisfaction has been about the weighing, when there were grumbles at the figures given out by the man in charge of the public weigh-bridge, who, certain people considered, had made errors on the heavy side.

A Comparison.

Out of a grand total of 162 entries only one absentee was noted on Sunday afternoon, so that the number of starters is a record. This is nearly forty more than last year at Taunton, and let us hope that the ranks will not be sensibly diminished before the week is out. The route is considerably more severe than last year, and, if a better proportion finish, it will denote real advance in construction and design. Though the skating rink is excellent for the motor bicycles, it is a little awkward for the cycle cars as the exits are narrow, and care has to be exercised by the drivers of the passenger machines in going out and returning.



A two-stroke Levis with two-speed countershaft gear and auxiliary chain gear enclosed in case, giving three speeds in all. It is being ridden by H. Newey.

STARTING THE COMPETITORS FROM THE SKATING RINK, CARLISLE.
C. R. Collier (7-8 h.p. Matchless sidecar) and F. C. de la Hay (2¾ h.p. Sunbeam). F. A. Applebee (2¾ h.p. Scott).

RST DAY: 124 miles. Carlisle, Cotehill, Kirkoswald, Penrith, WATERMILLOCK, Ullswater, KIRKSTONE PASS, Ambleside, FOOLSTEP HILL, RED BANK, Grasmere, DUNMAIL RAISE, Keswick (lunch), Braithwaite, WHINLATTER PASS, WHINFELL, Mosser, Buttermere, BUTTERMERE HAUSE, Derwent Water, Keswick, Bassenthwaite, ULDALE, AUGHERTREE FELL, Dalston, and Carlisle.

The weather, and the weather plays important part in these long distance als, was perfectly glorious on the open- ; day, and what is indeed good news that the forecasts are extraordinarily spitious. The A.C.U. officials were ry strict, and no one was allowed inside skating rink except the officials. isson (Wall tricar) arrived too late last ght to be examined, and so he was ghed and sealed before the start. The ler of starting on the first day was cided by ballot, and the numbers of competitors were called out by Mr. ss in order, by batches, to be allowed look after their machines for fifteen nutes, and, as each man started, his mber was crossed off a board, just as s done last year. A very fair crowd sembled towards 8 a.m. to witness the rt, and among those present we ticed Mr. Brooks, a Carlisle resident, o some years ago was a keen competi- in A.C.U. competitions. Messrs. uglas arrived in the new water-cooled uglas cycle car.

The Start.

The times at the start were taken by ssrs. C. P. Glazebrook and A. G. nolds. The first man to be dispatched Townshend (Trump), followed by rr (N.S.U.). The way out of Carlisle s clearly indicated by boy scouts and nemen, and, fortunately, there was le traffic. After following the London d for a short distance, an arrow nted to the left, and we may mention e that the arrowing, which was in the rge of Mr. C. L. Scott, of Messrs. mey Westall, Ltd., was excellently ne. Before the actual turn cards bear- the words "left" or "right" gave competitors due warning that a devia- n would be made.

For the first few miles the road surface was very rough and several steep pitches were encountered. The hill at Armathwaite, which only a few years ago would have been considered exceptionally severe, came quite as a surprise, but the vanguard took it in excellent form. Another surprise came at Kirkoswald, but these were but a foretaste of what was to come. Then came a magnificent descent to Penrith, through glorious country, and after leaving this town the men had to pass through two gates at each end of which, cap in hand, stood two children, but we fear that though the traffic exceeded their wildest hopes the revenue derived therefrom was, to say the least of it, disappointing. We next came upon the foot of Ullswater lake, which looked particularly beautiful, and at this point a notice board was passed which marked the beginning of the first non-stop section. Watermillock, one of the chief tests of the morning, was very long and about 1 in 5 near the top. On the whole the performances on the hill were excellent, but many made the all too common mistake of changing down too late.

The unfortunates who failed were Teeton (James), Guilloreau (Clément), Dibb (Rex sc.), Walker (Harding and Summers cycle car), Sproston (Clément), Brown (Rover), who assisted with his feet, Bassett (Sun-Villiers), who was using too small a jet; Morrison (5-6 Bat), one cylinder firing; Poxon (Bradbury sc.), Garland (Chater-Lea sc.), Edmond (Humber), Lea (Lea-Francis), Rutherford (Matchless sc.), Greenwood (Imperial), Cocks (Connaught), Crossthwaite (8 Matchless sc.), Day (Bradbury) fell, and Slater (J.B.S. cycle car) missed gear. Alexander (Williamson sc.) suffered from water boiling. Andrews (Ariel), Buckley (Matchless-Precision sc.), and Gabriel (Clément) failed near

Lionel Martin (10 h.p. Singer cycle car) on Watermillock Hause. This hill is 1¼ miles in length, with three sharp turns and a steepest gradient of 1 in 4½.

A.C.U. Six Days' Reliability Trials.—

the summit. Mr. A. V. Ebblewhite was taking the time check at the summit. The competitors then proceeded to Kirkstone Pass.

The first competitor we saw in trouble was Dr. Moss Blundell with a puncture; later Ellison Hawkes suffered in the same way. The Paragon cycle car early retired; it was reported that a horse was seen towing it only forty miles from the start.

Kirkstone Pass.

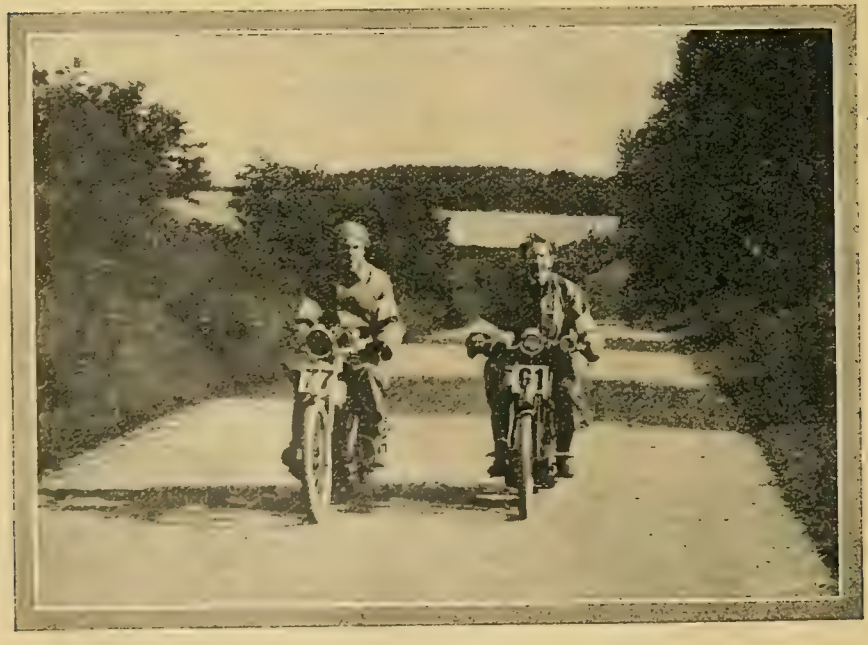
Kirkstone Pass from Patterdale ought not to have troubled the riders in view of what is in store, yet nine found the gradient too much for them. These were Keyte (Enfield), Greenwood (New Imperial), Hoult (Matchless), Norman Lea (Lea-Francis), and the whole French team, Guilloreau and Gabriel on the Clements, and Bourbeau (Bedelia), Pearson (Clyno sidecar), and Buckley (Matchless-Precision). Crossthwaite ran alongside his Matchless, and so succeeded in reaching the top. Through Ambleside the riders were directed to Foolstep Hill, which was the steepest gradient in Monday's route, and to make matters worse the stiff portion is on an S bend.

Observations on Foolstep.

We saw thirty riders come to grief here, including Milner (Levis), Ball (Douglas), Ritchie (Rudge), who were followed by many successful riders of whom we noticed Phillips (Douglas), Cooke (A.S.L.), the Singer cycle car, and Little (Premier), making excellent ascents. Holroyd (Motosacoche) was kept in check by a Williamson sidecar, but got up well nevertheless; Noble (Rover) only just changed down in time. Tamplin's G.W.K. baulked Colliver on the narrow road, but the Indian rider managed to crawl along behind the cycle car in very impressive style. H. C. Marston can claim to have made one of the best performances of the day on his 3½ Triumph sidecar. While many 3½ h.p. solo mounts and even twins failed, Marston showed the spectators how, with careful manipulation, a good machine can accomplish more than it was ever designed to perform. Lester treated the spectators to a fine skidding exhibition on his P. and M. The engine had ample power, but the back wheel first slewed to one side of the loose and stony road then to the other, but he got up under power all the same. The twin Jameses did well, except Dixon, who changed into neutral by mistake. Pearson (Clyno sc.) this time did splendidly.

A group of competitors and their machines at Carlisle.

The driver of the Harding and Summer cycle car knew he would fail and signalled to observers to assist him before actually coming to a standstill. Sproston's low gear, as we imagined, was not low enough for exceptional hills. The Ariel team to a man showed up well, also the Triumphs, though Mundy was baulked the first time by three fallen competitors including the Chater-Lea cycle car. Young (Chater-Lea) got up finely on the sidecar. Dan Bradbury's Norton has any amount of power, for he can switch off at bends when he wishes, and his engine takes up the drive again without protest. Stevens (A.J.S. sc.) actually left changing down until he was half-way up the 1 in 4 stretch. Hutchinson (Trump-Jap) skidded, but made a fine recovery. Garland (Chater-Lea) and Applebee, senr. (B.S.A.), stopped on the very crest of the hill, the latter due to a broken fastener. Gray (Rudge) hit a boulder at the roadside and came down heavily, but on the next try made a perfect climb. Hugh Gibson had got his throttle open too far, for on the bend his sidecar skidded bodily across the road into the bank and burst a front tyre. The Bat riders did very well, Tessier in particular.



On the road near Penrith. H. Berwick (3½ h.p. Hampton) and G. J. Shemans (3½ h.p. Triumph).

Beauties of Thirlmere.

The following made creditable ascents: Silver (Quadrant sc.), Davis (Clyno sc.), Hardee (Triumph), Edmond and Knowles (Humbers), Morgan (Morgan runabout), Hands (Williamson), and lastly, the Bedelia, which Bourbeau drove in excellent fashion.

The route now lay down Red Bank and Grasmere, through Wythburn to Keswick, and the beauties of the ride alongside Thirlmere should long remain in the memories of the competitors, for the atmosphere was clear and the hill tops sharply defined against a blue sky.

At Keswick we learned from Catt (Triumph) that his hub gear had got

Telephone: Tottenham 1612 (3 lines).

J.A.P. Engines can be obtained from stock from Robertson's Motor Agency, 157 Gt. Portland St., W.

Having, in the course of four detailed announcements, told you much about New-Hudson Three-Speed Motor Cycles, we now come to a few points of great importance, that cannot be illustrated. It is essential that their existence be fully appreciated by you. We refer particularly to the system of

Lock-nuts,

Spring washers and split pins fitted to every part of New-Hudson Three-Speed Motor Cycles likely to be affected by vibration.

This practice is unique, although the Motor Cycle Press has frequently urged the necessity of a lavish use of lock-nuts, spring washers, and split pins. We claim that no manufacturers have given more attention to these details than we have.

Finish.

New-Hudson finish is also exceptional. The plating is very thick and retains its lustre through a long life.

The general scheme of finish on all New-Hudsons is as follows: Black frame, forks lined brown and green, brown tank with claret panels, lined in black and green. Gold lettering. Grey finish, with lining in black, is optional.

The Tests.

New-Hudson's receive their road tests under conditions similar to but much more severe than those arising in ordinary use.

The course shewn in the plan below—over thirty miles of difficult roads and steep hills—is traversed by every machine before its final inspection and adjustment. It is only when the machine has completed this course to the satisfaction of our expert testers—men able to detect little faults in running whose existence you would never suspect—and found, on its return to our works, to be perfect in every part, that it is passed as ready for the road. As a consequence of this rigid system of testing, combined with our careful manufacture, New-Hudsons run with the consistent reliability of the Scotch Express.

of the New-Hudson Cycle Company, where every process is carried out upon a large, economical scale, and the most rigid tests made to ensure your perfect safety and comfort. Only the direct association of component parts—absolute homogeneity—can assure you absolute reliability. And have we not proved many times that New-Hudson Three-speed Motor Cycles are consistently reliable, even in the hands of unskilled riders?

And now—

we have told you a good deal about New-Hudson Three-Speed Motor Cycles—enough to make you realise how much better they are. We have given details of the New-Hudson engines, magneto, carburetter, Armstrong three-speed hub, front stand, kick-starter, back carrier, adjustable pulley, tank, aluminium footboards, silencer, foot brake, front brake, countershaft drive, wheels, mud-guards, tool set, pannier bags, and front forks.

All these features are made so well as to provide New-Hudson reliability—*the kind any novice can realise.* And then, after receiving a beautiful finish, they are built-in, one with the other, and, after the final tests are successfully passed, are known as New-Hudson Three-speed Motor Cycles—the "World's Best Value."

The whole story, under one cover, made far easier to refer to than is possible within these announcements, and illustrated with topical photographs of real interest, is contained in the New-Hudson Motor Cycle Catalogue. Before doing anything else, you should write for your copy. Send a postcard now and make sure of it. A book of instruction for the novice, and of reference for the expert.

Invitation.

Come for a pleasant ride with us—in a comfortable sidecar—and with a New-Hudson by your side, see for yourself how sweetly it runs, how easy it is to drive. Write us about this now.

ON KIRKSTONE PASS.

Victor Garland (8 h.p. Chater-Lea sidecar). H. Blamire (5-6 h.p. Hazlewood) and Norman Lea (3½ h.p. Lea-Francis).

deranged, the middle gear only being workable, Hawks (Rudge) had had three punctures, Browne (James) was troubled with tank sediment collecting in the jet, Cuffe (Premier) arrived very late for lunch, having had to remove his back wheel twice, owing to tyre troubles. He elected to continue without stopping for lunch.

A Rough Mountain Track.

After an excellent lunch at Keswick, where we heard that Sawer (Premier) had suffered a puncture, we pushed on up Whinlatter Pass, which, though rather better engineered than many of the Lakeland roads, possesses a couple of fairly steep pitches, and is on the main route from Keswick to Cockermouth. Some miles down the Pass the main road was left, and the route winds to the bottom of the valley through Low Lorton village. Fortunately, the long descent cooled the competitors' engines. The hill is approached by a fairly steep ascent and a very sharp corner, followed by more steep pitches and a very rough surface interspersed with water courses and ending in a grass track, which caused some grumbling, the performances up this hill were excellent, and we only noted two failures, those of Guilloreau and Sproston, among about eighty we observed.

On Buttermere Hause.

The performances on Buttermere Hause were much better than anticipated, a splendid percentage successfully reaching the top of this long tiring climb which peters out into a grass-grown track. There were six failures, comprising those who found Foolstep too much for them. F. W. Roberts (5-6 Rudge) was credited with the fastest ascent, though speed on such a road abounding in water courses was risky, and most preferred to peg away slowly on their low gears.

Hairpin Bends.

After Newlands Hause there was a magnificent run round Derwent Water, commencing with a climb known as Cat Bells, which is not excessively steep, but includes two bad hairpin bends. The cornering in some cases was not to be admired, several riders being obviously nervous and shaky. Others went round as coolly as it was possible. Incidentally, there are a lot of novices in the event, and we vow they will return home with a profound respect for Lakeland acclivities, for Mr. Loughborough assures us that Monday's run is the easiest of the five. It is difficult to avoid bunching with so many competitors, but many owe their failures to being hampered.

Passing through Keswick a second time, the route home was *via* Chapel Beck and Aughertree Fell. At the former place we encountered L. Martin inspecting the cause of a noise in his cycle car engine, and subsequently traced it to a burnt out big end bearing.

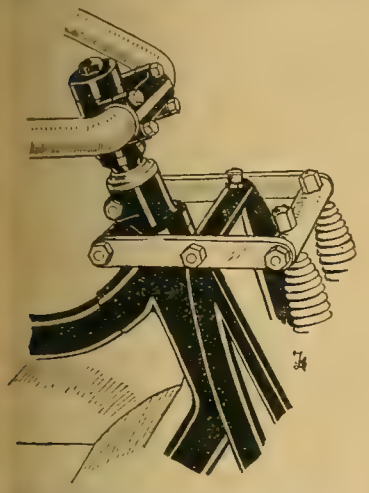
Many Failures at the Rake.

The Rake was the next test hill, and there were over two dozen failures. It was not so much due to the gradient as the loose stony surface, which cut up badly on the right angle bend of 1 in 5 or so. Steel (Sunbeam) charged up a bank and squandered the spectators. Ingham (Veloce) was baulked by Drake (P. and M.), but did well next time. It was the turn for B.S.A. riders to show up well here. S. L. Sealey came along when two riders who had failed occupied nearly all the road, but he neatly rode between them, and received applause. Fenn also made a sure climb. Newey (Ariel) made a good climb, also his brother on a Levis. Mundy almost stopped, but his Triumph kept going. Hands managed his Williamson with great skill, and steered a perfect course.

S. Browne (3½ h.p. twin James) approaching one of the bends on Foolstep.

A.C.U. Six Days' Reliability Trials.—

The G.W.K.'s and the Morgans were again among the successful ones. Greaves (Enfield sc.) has ample power; his only difficulty is to hold his combination on the corners. Rutherford's failure on an 8 h.p. Matchless sc. was simply owing to trying to go fast, and consequently skidding bodily into the ditch. Cocks is suffering from a slipping clutch on his Connaught, and Lea (Lea-



Spring handlebars and double spring forks fitted to the Enfield sidecar ridden by H. Greaves.

Francis) complains of overheating, hough his *confrère*, Francis, had a no-rouble run.

On the run home we overtook Green-vood (Imperial) who had plug trouble, slater (J.B.S. c.c.) who lost a footboard, nd Silver (Quadrant sc.) who ran out f petrol only three miles from the finish. Guest (Matchless) broke a sidecar stay, nd among the absentees may be men-ioned Glisson (Wall tricar), who was ot seen after the start, and Bourbeau Bedelia), who disappeared after lunch. Among the day's incidents may be men-ioned the case of Dover, who ran over dog and fell in the second non-stop ection.

It was the general opinion at the end f the day's run that a 20 m.p.h. average ver such twisty and narrow roads is xcessive, especially in view of the radients, which naturally mean increas-ng the pace afterwards to make up time. On Monday evening Hugh Gibson handed n a protest to the officials signed by the idecar drivers protesting against such a igh average speed in view of the state nd nature of the roads.

C. B. Moss-Blundell went over a wall escending Kirkstone and damaged the ater connections, but continued. The ollowing were the ten retirements in Monday's run: W. Cooper (Humberette) ngine trouble, W. Land Dibb (6 Rex c.) burnt out low gear brake band, F. . Portway (9 Paragon c.c.) seized ngine, T. Rutherford (8 Matchless sc.) eared magneto sprocket, H. Berwick ½ Hampton) gear trouble, E. B. Glis-on (8 Wall tricar) big end bearing, W. hater-Lea (8 Chater-Lea c.c.), R. Bour-eau (8 Bedelia c.c.), and C. Duplock (6 .J.S. sc.) It will be seen that there ave been five retirements of the twelve ycle cars entered.

SECOND DAY: 164 miles. Carlisle, Wreay, Penrith, Orton, Grayrigg, Kendal, Sedbergh, WHITE SHAW MOSS, Ingleton (lunch), NEWBY HEAD, Hawes, BUTTER TUBS PASS, STONESDALE HILL, TAN HILL INN, Brough, Appleby, Skirwith, Glassonby, Kirkoswald, Gumwhitton, Warwick, Carlisle.

Tuesday morning proved another glorious day, though dull at the commencement. The first section was rough, but improved later, and there were no difficulties in the route till some miles after Penrith. The main road was then left and a terribly rough surface encountered followed by a watersplash six or eight inches deep, causing several riders to stop. Mills, whom we had passed previously repairing his belt, dropped his route card in the middle of the stream and had to wade in to recover it.

A Hill which Caused a Protest.

Next followed a grass-grown surface with deep ruts, which served no other useful purpose than to test the three track cycle cars. After Kendal Greyhound Hil' had to be climbed, and though there were many spectators to see the long line of riders, there were very few failures to interest them. The real test of the morning was Gastack Beck, seventy miles from the start, and beyond Dent; it was approached by an awkward hairpin, followed shortly after by another, after which came a stiff ascent with rough surface, with about a 1 in 4 gradient, which was really difficult and accounted for many failures. Excellent climbs were made by D. M. Brown (3½ Rover), P. Grout (6 A.J.S. sc.), F. C. North (3½ Ariel), H. C. Mills (3½ Zenith-Green), S. Tubb (3½ Humber). J. Hoult (3½ Matchless), R. Pearson (6 Clyno sc.), C. M. Keiller and A. T. Tamplin on G.W.K.'s, while H. Newry (2¾ Levis) made a most creditable performance. J. Oliphant (3½ Premier), though impeded by a fallen competitor, made a fine climb, and R. E. Guest (8 Matchless sc.) went up excellently, and so did A. J. Stevens (6 A.J.S. sc.), and G. A. Gregson (6 Bat) also climbed well.

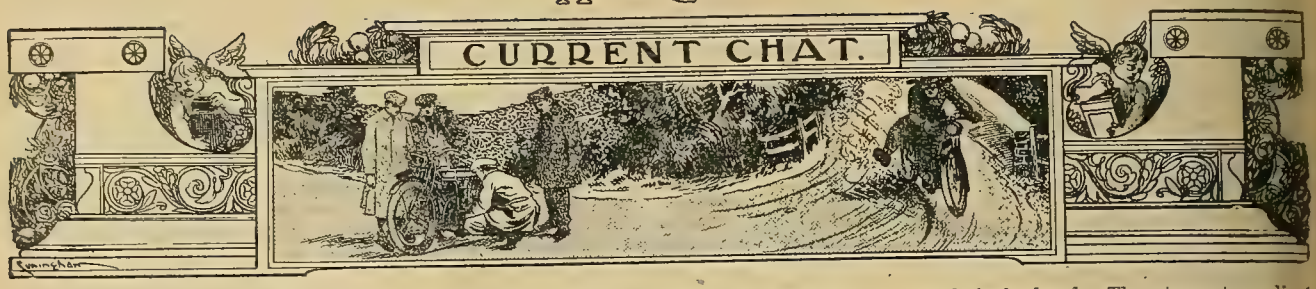
G. J. Francis (3½ L.F.) came up silently, but he had just to give one dig with his foot, and Norman Lea (3½ L.F.) did even better. T. Silver (7 Quadrant sc.), the veteran, was among the best. A competitor passed H. Blamire (5 6 Hazlewood) on the gradient, and they hampered one another, while Richard (4¼ Sun-Precision), G. Hunt (6 Campion), and F. E. J. Bartlett (4 Endurance) came up well, but the last named had to avoid the Harding and Summers cycle car. F. Dover (3½ Premier) and F. W. Applebee, senr. (3½ B.S.A.), both of them veterans, made splendid ascents, the latter being very fast. A. E. Catt (3½ Triumph) went up shouting with joy, and J. Chater-Lea, junr. (8 Chater-Lea sc.) came up in good form. G. T. Gray (5-6 Rudge) skidded all over the road and had to assist with his feet, and A. C. Andrews (3½ Ariel) skilfully avoided R. Mundy (3½ Triumph). F. G. Ball (2¾ Douglas) had to crawl behind the J.B.S. cycle car. W. Westwood (3½ Triumph), a local rider, was heartily applauded, while W. H. Longton (3½ Alldays) and Morrison (5-6 Bat) made excellent ascents.

The surface of the hill was appallingly bad, and the ascent terminated in a final steep pitch almost as acute as the first piece. Gastack Beck is undoubtedly an abnormal hill with an abnormal surface.

At mid-day to-day, the following are reported to have retired: P. Grout (2¾ Douglas), gear trouble; R. C. Davis (5-6 Clyno), engine trouble; Thos. Stevens (4½ James sc.), chain trouble. A. D. Arter (4½ James sc.), is overdue.

One hundred and twenty of the competitors who took part in to-day's run signed a protest against the hill above Gastack Beck being included in the trials. This hill is the one on which the above observations were made.

H. C. Marston (3½ h.p. Triumph sidecar), the only 500 c.c. sidecar combination in the Trials, and W. Land Dibb (6 h.p. Rex sidecar) on Watermillock Hause. Note the state of the surface.



TIME TO LIGHT LAMPS.

Aug. 21st	... ...	8.10 p.m.
,, 23rd	... ...	8.6 ,,
,, 25th	... ...	8.1 ,,
,, 27th	... ...	7.57 ,,

Methods of Lubrication.

"The lubricant in his silencer was beginning to run low, and he feared that shortly the humming of his machine would betray his presence." From "The Flying Detective." Let us continue! "Therefore he hurriedly dismantled the armature and cleaned it with a piece of Brooks soap, jettisoned his carburetter, and put another handful of the finest sand into his crank case. He then proceeded calmly and silently on his nefarious errand."

Liege-Paris Trial.

The above event was held on the 15th, 16th, and 17th inst., and comprised a journey from Liège to Paris and back at various speeds, according to the horse-power of the machines, a speed trial at Spa, and a hill-climb. Every competitor who did not lose more than a minute at any of the twelve controls receives a gold medal, and a silver cup for the best team performance, and each member of the team a special award. Prizes were also offered for first and second on time and formula in the speed trial and hill-climb.

The following British riders finished: A. J. Dixon (3½ Singer) and S. A. Rowlandson (3½ Rudge), and the following Continental riders completed the journey on British machines: Kummers (3½ Singer), Kutegens (3½ Singer), Pacquay (3½ Singer), Lemont (3½ Rover), Cocriamont (3½ Premier), Taymans (3 Royal Enfield), and Lewis (4 James), while Mengold finished on a 7-9 Indian. The awards will be announced at a later date.

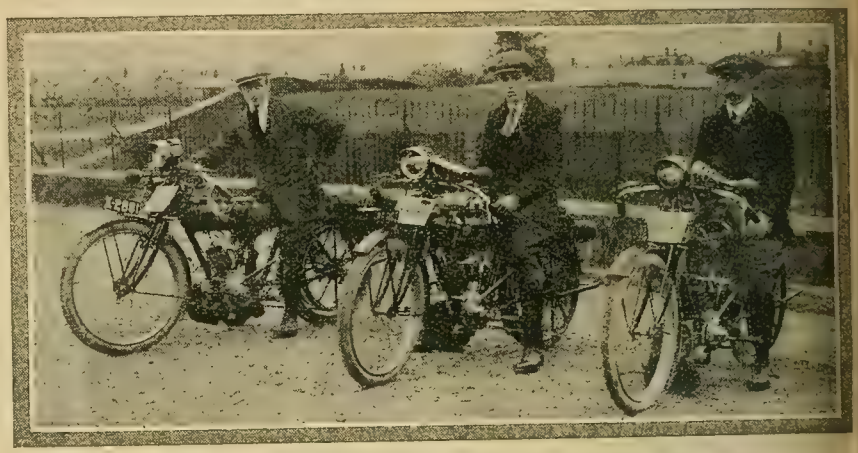
Rosedale Abbey Bank.

We are informed that this hill has been recently ascended by F. E. S. Townsend on a 3½ h.p. Ivy-Precision fitted with Sturmey-Archer three-speed, gear ratios 4.75, 6.96, and 9.78 to 1. He made the climb at the fourth attempt. It is believed that this is the third successful attempt.

This hill is situated between the village of Rosedale Abbey and Kirkby Moorside. There are several gullies and more than one hairpin bend. The steepest gradient is approximately 1 in 3.

Good Ears or a Long Bow.

When a motor cyclist was fined 10s. and costs at Bromyard recently for using a cut-out on a motor cycle, the police constable stated that he could hear the noise of the exhaust for fifteen minutes before the rider reached him. Estimating the speed at 20 m.p.h. the explosions were heard five miles away! After this we need no longer appeal to "Friends, Romans, Countrymen" for a useful loan, it will be more profitable to "Ask a Policeman."



THE NUT-J.A.P. TEAM. All of the machines are fitted with 3 h.p. engines, belt drive, and hub gears. Left to right the riders are R. S. Scoon, G. E. Keel, and J. Robinson.

PASSENGER MACHINES ON FOOLSTEP. THE STEEPEST GRADE IS 1 IN 4½.

(1) H. F. S. Morgan and Mrs. Morgan (8 h.p. Morgan runabout) followed by E. Keyte (3 h.p. Enfield).

(2) The passenger representative of the French team, R. Bourbeau (8 h.p. Bedelia c.c.)

Mont Ventoux Hill-climb.

The first sidecar to be entered for this important French hill-climb is a Clyno, which, of course, will be driven by Frank Smith.

Stolen Machines.

A new Douglas was stolen in Guildford on the 9th inst. The engine number is 10.193, and the owner, Mr. G. Kinneir, is offering £10 reward for its recovery and the conviction of the thief.

A 3½ h.p. Sunbeam.

A larger single-cylinder Sunbeam has just been introduced. Though in outward appearance it exactly resembles the now popular 2¾ h.p. model, the 3½ h.p. engine has a bore and stroke of 85 × 88 mm. and a three-speed countershaft gear exactly similar to the one fitted to the 6 h.p. twin which we dealt with some weeks ago. The gear change is operated through a gate. The engine is noteworthy for its large diameter valves, which measure 1½in. across the head. A slipping clutch of the same design as on the 2¾ h.p. is used, and, of course, oil bath chain cases.

Proposed Speed Limit for Wallsend.

Motorists generally, and especially those residing in the North of England, are asked to note that the Wallsend Borough Council on Tyneside, having made application to the Local Government Board for a reduced speed limit on the main road through Wallsend, have, at the request of the North-eastern Automobile Association also representing the Royal Automobile Club and the Automobile Association, agreed to withdraw their application for twelve months. This withdrawal is conditional upon the North-eastern Automobile Association providing special signs, and the object of this note is to request all motorists using the road, which is part of the main road from Newcastle to Tynemouth, to use special care in driving through Wallsend.

FUTURE EVENTS.

Aug. 30.—Streatham and District M.C.C. Annual Open Hill-climb.
" 30.—Hertfordshire M.C.C. Open Half Day Trial.
Sept. 3.—Bournemouth & District M.C.C. Open Speed Trials.
" 6.—Scottish A.C.U. Speed Championships at St. Andrews.

" 6.—A.C.U. East Midland Centre Speed Trials.
" 13.—B.M.C.R.C. Race Meeting.
" 20.—Streatham M.C.C. Open Speed Trials at Brighton.
" 24.—A.C.U. Open One Day Trial.
" 27.—B.A.R.C. Brooklands Meeting.

Unknown Garages.

We have received a complaint from a reader that, when his machine was left at a garage in Blackpool, it was ridden in his absence and damaged. We hope that such proceedings are uncommon, but still, it is a wise precaution when leaving a valuable machine in the charge of unknown persons to put a suitable padlock on it. The reader in question was unable to obtain any satisfaction from the proprietor.

Hill-climbing in the Alps.

Sixteen competitors took part in a two days' reliability trial and hill-climbing competition from Marseilles to Lyons on the 15th and 16th inst. Altogether five important mountain passes were crossed, the greatest height reached above the sea being 7,800 feet. The only competitor to reach Lyons without loss of marks was the rider of a 7 h.p. Indian, who won the 1,000 c.c. class. Frank Smith, on a Clyno (32 points) won the 750 c.c. sidecar class. The 500 c.c. bicycle class was won on a Clément, as was the 350 c.c., and the 500 c.c. sidecar class on a Motosacoche.

A Forthcoming Open Trial.

Among the prizes in the open reliability trial on October 4th, organised by the Sutton Coldfield A.C., will be the P. J. Evans's cycle car trophy, which will be awarded, with a gold medal, for the best performance in the cycle car class. The trophy must be won three times to be won outright.

B.M.C.R.C. September Meeting.

The next meeting of the B.M.C.R.C. is to be held on Saturday, September 13th. The events in the preliminary announcement are as under:

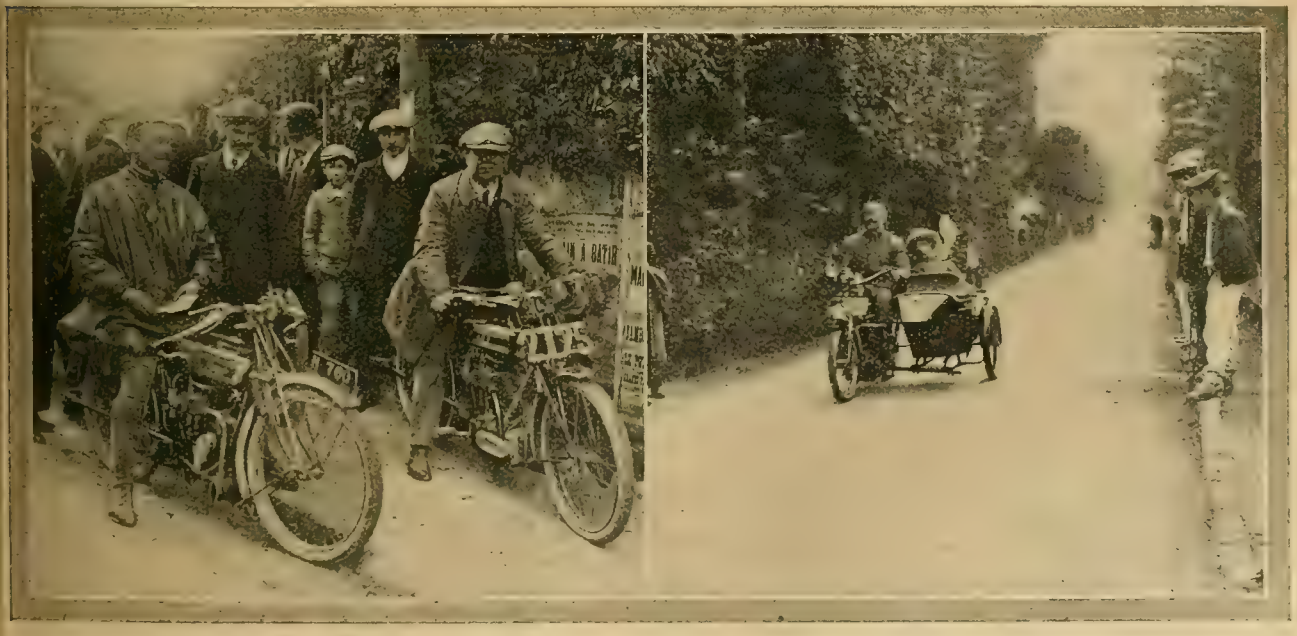
Morning.—Time trials.

Afternoon.—2 p.m.: One Lap Sprint, Classes A and B. 2.10 p.m.: One Hour Team Race, Classes A and B. 3.15 p.m.: One Lap Sprint, Class C. 3.25 p.m.: One Hour Team Race, Class C. 4.30 p.m.: One Lap Sprint Race, Classes D and E. 4.40 p.m.: The Sidecar Relay Race. 5 p.m.: Ten Miles Scratch Race and Sealed Handicap for Cycle Cars and Sidecars.

The team races are open to teams of three of any single make; greatest aggregate distance wins. In the Sidecar Relay Race one of the machines must be of Class C.

A.A. and M.U. Note.

CATTLE ON HIGHWAYS AFTER DARK.—The Executive Committee of the Association has granted a sum towards the costs of contesting an appeal by the owner of three sheep killed by a car. The County Court judge held that the negligence was entirely on the part of the owner of the sheep, one hundred of which were being taken along the road on a pitch dark night without lights or anything to indicate their presence to other road users, and nonsuited him. In view, therefore, of the importance of this case to motorists, the Association decided financially to assist the motorist involved in contesting the appeal.



BRITISH MACHINES IN THE PARIS-LIEGE TRIAL. Left—Riders of a Singer and Triumph waiting to enter a control. Right—A Canoolet sidecar.

An Afternoon's Run in Picturesque Airedale.

IF you do not already know the capital of Craven, namely, Skipton, the oldest chartered market town in Airedale, and probably the oldest in Yorkshire, it is high time you did, for, apart from being a splendid centre for a number of trips, it is full of interest itself, possessing a famous castle, believed to date back to the reign of William I., and an ancient parish church. However, it is not the writer's intention to probe very deeply into history, but rather to have a pleasant jaunt, and therefore we will leave the castle and run down to the bottom of the market place, where a signpost points to Clitheroe, and this is the road we will follow for about three and a half miles to Broughton, having a good view of the hall grounds on our left as we approach the village. We leave the main road at this place by turning to the right and passing through the village proper by somewhat narrow but very pretty roads, run on to Gargrave, a nice little place which, tradition says, originally had seven churches, six of which were destroyed in some Scottish raid, the remaining one being spared because it was dedicated to the Scottish patron saint.

A TRIP IN AIREDALE: PICTURESQUE "MALHAM."

(1) Showing the entrance to Gordale Scar. (2) A pretty scene near the village of Malham. (3) View of the falls in Gordale Scar.

On entering Gargrave, we proceed over the river bridge and then immediately turn left as if for Settle; about two miles on at the village of Coniston Cold we turn right and proceed through lovely lanes to Bell Busk, but, instead of running down to the station, take the turn to the right over the river bridge and continue straight on to Airton, where close by is Calton Hall, the birthplace and one time residence of General Lambert, well known in connection with Cromwell during the Civil Wars. Continuing straight through Airton, we soon drop down into Kirkby Malham, where the old church contains references to the aforementioned general; but the next village, Malham, being the chief object of our trip, we go straight on and soon arrive there.

Fine Views and Steep Hills.

Now Malham itself is only a tiny little place, but for all that it seems an easy matter to obtain sufficient fuel, and of excellent quality, for the inner man, but on no account is it advisable to run short of petrol. No one in this vicinity seems to keep this necessary commodity.

After refreshments, we go over the little bridge, and by proceeding straight on over very bumpy and narrow roads and down a stiff hill, we obtain a grand view of the famous Gordale Scar in the distance. We make for this by dismounting and wandering through a few fields.

The Scar is probably the finest view of its kind obtainable in Great Britain, it takes the form of two giant limestone cliffs gradually closing in on each other, at the end of which, from a considerable height, flows a stream. Although I call the waterfall the "end" it is not really so, for by tricky driving we can surmount the first obstacle and so climb to the top of the cliffs, but if one is not careful overheating may intervene. From the top it is possible to walk a mile or so to Malham Cove, but remembering that the machines are still within a respectable distance, it is better for us to return and ride back to the village, and, on entering, take the road to the right and by means of a very stiff hill with numerous water cuts

An Afternoon's Run in Picturesque Airedale.—

running across proceed a mile or so to the Tarn. This road gradually gets worse and worse, and unfortunately for us the Tarn is private property. This Tarn is the largest natural lake in Yorkshire, the water goes to ground at the Water Sinks, and eventually reappears at the Cove, which we reach by returning to the village and taking a short walk up the road to the left and through a few fields.

The Cove is a grand and peculiarly formed limestone cliff of crescent formation nearly 300 feet in height. Here the river Aire commences its life, being a bright and cheerful stream, and no one who has seen this river passing through the City of Leeds would ever for one moment associate it with such a glorious birthplace as the one under review.

A Delightful Round.

Geologists, botanists, hill-climbers, and rough-riders will find plenty to interest them round this district, but seeing that we are only ordinary tourists we will pack up our traps and away from this paradise, returning by the way we came to a mile the other side of Airton, and here turning left over the bridge make for Eshton, passing on our way through the grounds of Eshton Hall, the home of Sir Matthew Wilson, in whose house, I believe, are a number of very fine paintings.

Running through this pretty spot we notice some fine Alderney cattle gazing at us with limpid eyes, but unfortunately we soon leave this delightful place behind, and half a mile before Gargrave turn left, and another half-mile further on left again, thus joining the Skipton-Settle main road and so run on to Skipton. At the time of penning these notes, the surface of this section is the worst we have struck.

This trip is one of the best I know, the roads on the whole are good, except that in parts they are somewhat narrow, and care should be exercised round the corners. The distance is not great, only about thirty miles, so that anyone not living near Skipton need not fear the jaunt, but they must remember it takes a considerable time to view the beauties of Malham, only the chief of which I have mentioned.

H.W.F.

AUSTRIAN MOUNTAIN CIRCUIT.

INFLUENCE OF RACING UPON DESIGN.

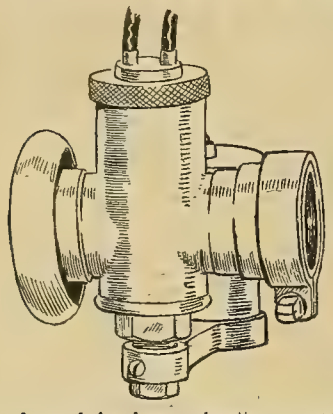
The Mountain Circuit Reliability Trial of the Austrian Allgem. Motorfahrer Verband was held on the 13th inst. and drew over fifty entries of motor cycles, sidecars, and cycle cars. The sport is beginning to have its renaissance in Austria. Recently an enterprising motor cyclist has started an agency for Indian and Douglas machines in Vienna. The trial was a distinct success, only six riders failing to get through within the time limit. Conspicuous among the competitors were the Puch representatives, who had gained much valuable information from their participation in the Tourist Trophy, and had adopted numbers of English "notions" on the Puchs, such as three lever Bowden control, Armstrong three-speed gears, XL'All saddles, B. and B. carburetters. The gears excited great interest and no little comment among the Austrian motor cyclists, who, to a great extent, still know the use of a clutch only from hearsay.

OWLER BAR, a favourite meeting point for Sheffield motor cyclists.

A.C.U. SIX DAYS' TRIALS.

A Look Round the Competing Machines.

AN examination of the machines in this week's trial, which were grouped in rows in the Skating Rink, Carlisle, on Sunday, revealed nothing startling in the way of design.



A new design Amac carburetter on several competing machines. The shield at the back is to collect blown back petrol so that it may be drawn into the engine again.

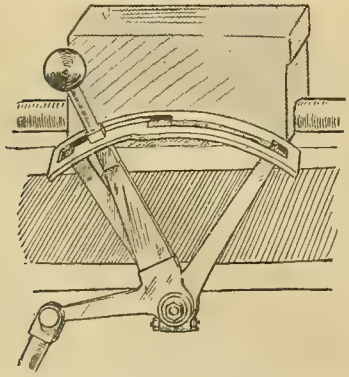
The Six Days' Trial is usually the test selected by manufacturers, in which to put their new models, or, at any rate, new features of design to their final test.

Of innovations there are plenty, but in the main the machines are of a thoroughly workmanlike character with nothing experimental about them. Indeed, many of the machines are absolutely standard throughout, notably the Triumphs, Premiers, Rovers, Scotts, Douglases, Enfields, Bradburys, A.J.S., Humbers, and B.S.A.s.

As might be expected, there is not a single-geared machine among the 150 odd in the trial, and most have gears with low ratios in the region of 12 to 1, whilst some go as low as 18 to 1.

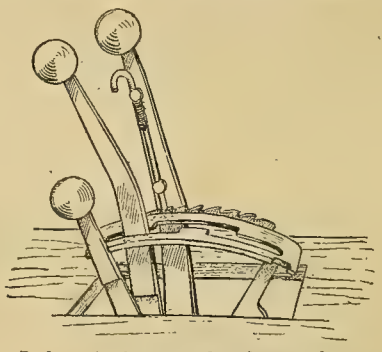
One of the highest geared machines is E. H. Lees's 8 h.p. Zenith, with ratios of 3½ to 5½ to 1. Lees is an amateur, and is carrying no spares though his machine has run 4,000 miles. It will be interesting to see how his 99 × 77½ J.A.P. twin fares on the hairpin bends with which the course abounds.

Among the new mounts making their *début* are three James twins, such as we described a fortnight ago. They have 3½ h.p. J.A.P. engines, three-speed countershaft gears on the same lines as the well-tried gear on the larger mount, but smaller and lighter, and chain drive throughout. Their weight (exceeding 220 lbs.) caused some astonishment, but several 3½ h.p. machines scaled 270 lbs., and doubt is being cast on the accuracy of the weighbridge used. Three Nuts with J.A.P. engines similar to the James and Lea-Francis are also out in competition for the first time. These machines have belt drive and Armstrong gears, with kick starters. Berwick is riding a Hampton with T.D.C. engine and Armstrong mark VII. hub gear. He is not overconfident, seeing that his machine was only assembled last week, and is practically untested. The gear is the latest Armstrong, the only one in the trial, and has a large and improved change-speed lever.



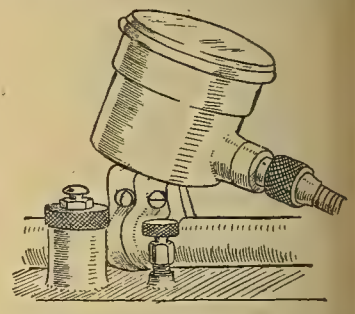
A neat gate change speed lever on C. R. Collier's Matchless sidecar combination.

Among the passenger machines, the Bedelia is a newcomer to six day events, and there is a great deal of speculation as to what it will do. It was seen hung up on Kirkstone Pass on the way to Carlisle on Saturday, but the driver told us that his baggage accounted for this, and with luck he hoped to get round. The 82 × 100 mm. twin engine, with cylinders at 90 degrees, is geared 4 to 1 on top, and by means of a double counter-shaft and chains a low gear of 12 to 1 is obtained, which should see it up the steepest hills with such a hefty engine and a light vehicle. The expanding pulleys work on the automatic governor principle. The 6 h.p. Enfield sidecar machine, handled by Greaves, is a forerunner of the 1914 model, having an underslung frame sidecar, spring handlebars, giving a four-inch movement by means of three enclosed spiral springs, double springs to the front forks, and spring footboards. These devices should go to make the Enfield sidecar much more comfortable, there never was any doubt about its reliability; as instance of this, there are four in the trial. Incidentally, Greaves's machines has a new Amac carburetter, of which there are four or five in the trial.



Brake, gate change-speed, and reverse levers on the J.B.S. cycle car.

Charlie Collier has still further improved his Matchless sidecar. A neat little gate change on the top tube is used to operate the three-speed gear, and the lubrication is arranged so that oil is first fed to the back of the front cylinder, and another pipe conveys o to the driving chains. The supply in t latter case is governed by a tap. Fitte with a smart coachbuilt sidecar th Matchless is among the prettiest sideca in the trial.



Speedometer attached to the top tube of E. A. Colliver's 7 h.p. Indian. It is a Corbin and Brown, driven from the rear wheel.

A Four-speeded Cycle Car.

The J.B.S. cycle car is a newcom to trials work, and should do well, f it is designed on well-tried principl having an 8-10 h.p. J.A.P. fan-cool engine, tubular frame and shaft drive a particularly strong looking rear ax with strengthening webs cast integr It is chiefly notable for its four-spe and reverse gear box, the top ratio bei 4½ to 1 and the low 14 to 1. T Harding and Summers cycle car is t same that participated in the Scott Trials, likewise the Singer, driven by Martin, which has received much atte tion in drilling to reduce weight to t required limit. The Paragon is air-cool and is notable for its extremely lo belt drive.

In examining the machines we ma a point of enquiring for gear ratios, a it is strange how different the feeli is in respect of gears.

Sproston's Clement has ratios of 7 a 10½ to 1, ratios too low for top and t high for bottom in our judgment, b practically all the lightweights have 6 1 top gears. The Sunbeams and Le Francis are on equal terms with 6 a 12 to 1 ratios. The two latter, by t way, have the Everest automatic ca buretter, which we described recently.

At the last moment the trials we robbed of interest by the non-appearan of the three three-speed Scotts with sid cars. Mr. A. A. Scott told us th owing to an unforeseen occurrence, was found impossible to finish the n

London,
August 2nd, 1913.

Dear Sir,

I am simply delighted with the carburettor. It is wonderful the way you can crawl along in traffic, and then slam the lever open, and then simply leap ahead by the movement of one lever. My friends were very sceptical at first. One of them is ordering one to-day.

ORIGINAL CAN BE SHEWN AT WORKS, ALLOWANCE MADE FOR OLD CARBURETTORS.

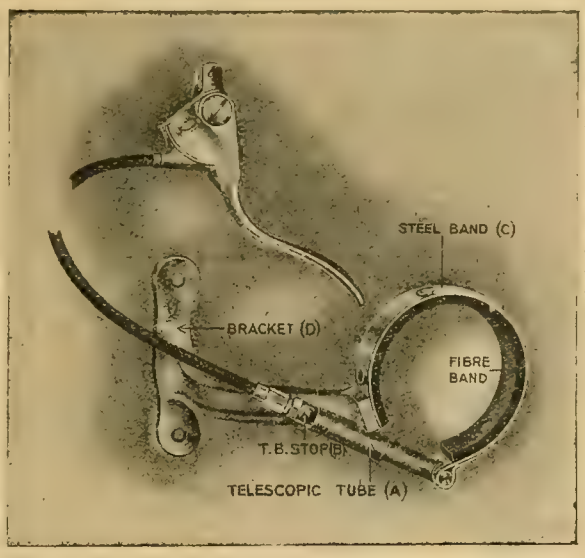
EXPERIENCE

BOWDEN
HANDLE-BAR CONTROL
for
PHILIPSON PULLEY.



The only efficient control.

The only efficient control for the Philipson pulley is from the handle-bar. It is obviously impossible to retain accurately any desired gear by means of foot control, for the reason that roads are not billiard tables.

The Bowden Control takes the form of a band brake, which operates on the collar of the pulley.

When ordering, state make and year of machine and diameter of handle-bar.

Prices :

SUCCESSES IN THE

DAYS TRIALS

A REVUE!

A.C.U. 6 DAYS' TRIALS.

1909 Kempshalls won the Team Prize and Gold Medals.

1910 Kempshalls won the Team Prize and Gold Medals.

1911 Kempshalls won the Team Prize and Gold Medals.

1912 Kempshalls won the Team Prize and Gold Medals.

N.B.— This year's results are not to hand at the time of going to press with this advertisement.

SCOTTISH 6 DAYS' TRIALS.

1910 Kempshalls gain numerous Gold, Silver and Bronze Medals.

1911 Kempshalls gain numerous Gold, Silver and Bronze Medals.

1912 Kempshalls gain numerous Gold, Silver and Bronze Medals.

1913 Kempshalls gain 16 Gold Medals and Special Prizes for private owner and trade rider.

The remarkable continuity of these successes can only point to one thing, viz.:—The overwhelming superiority of Kempshalls. Have you fitted them yet?

Copy of our latest list will be sent free on request.

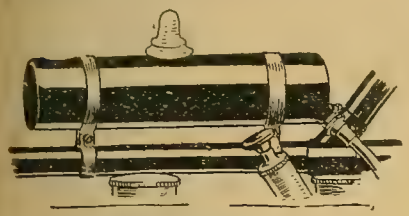
KEMPSHALL T.Y.R.E.S

A Look Round the Competing Machines.—

gear in time, so the riders held a hurried council of war, and elected to dispense with their sidecars and ride the standard two-speeders as solo mounts. The Douglases have low gears of about 12 to 1, and appear to be standard otherwise in every detail. C. E. Murphy, by the way, is riding a Douglas, and not the machine first named. The 7 h.p. Indians of Colliver and Alan Hill attract attention, not only by their vivid red finish, but by their absolute controllability. On the low gear the riders can crawl along around obstacles in a manner that compels appreciation. The gears are 4 and 7 to 1 with 28in. wheels—

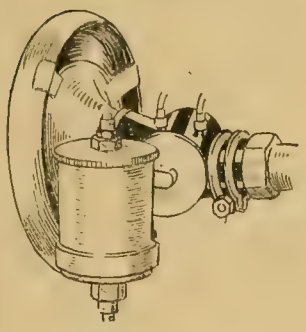


Water tank on the top tube of Dr. Moss Blundell's Green Precision.

not low in view of the prevalency of single-figure gradients and acute bends. Hill's silencer has been named "the Octopus," as it has two pipes at the foremost end, and three others of different diameters extending rearwards.

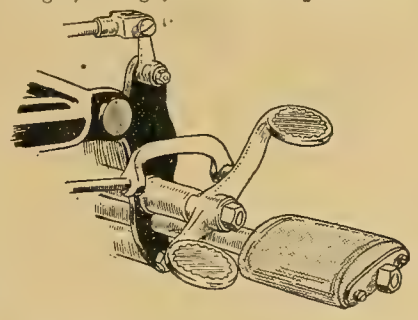
A Tyre Riveted to the Rim.

G. T. Gray is riding a 5-6 h.p. Rudge, and so certain is he of immunity from tyre troubles with his Kempshalls that he has *riveted* the covers to his rims to prevent creeping. We shall see! The P. and M.'s are always attractive competition mounts. Those in the trial are of exquisite finish with black and green tanks and plated carriers. This latter move is sure to be copied, for what tourist has not rendered his black finished carrier unsightly owing to the straps chafing? The P. and M.'s also have aluminium cast number plates and



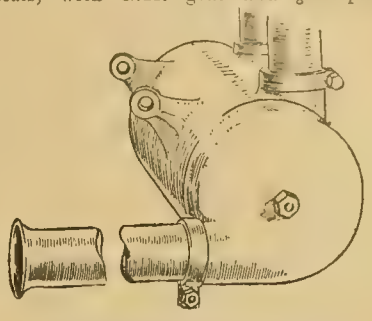
Mud screen and shield over the air inlet of Senspray carburetter on a Connaught.

an acetylene generator fastened by a bracket to the crank case with plated pipe connection for the lamp affixed to the tank tube. C. Q. Roberts's Blackburn and Dr. Moss Blundell's Green respectively have special handlebar controlled clutches to their hub gears. H. W. Hands' Williamson is a water-cooled model, and the rider hopes to do as well as Mundy did in Scotland on an air-cooled mount of the same make. The four L.M.C.'s possess no departure from standard practice. The two-stroke lightweight brigade are represented by the Levis and the Connaught, though, if rumour prove true,



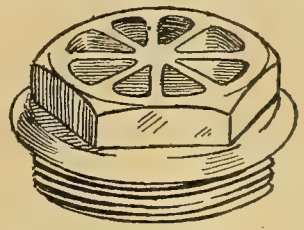
Separate mounting of clutch pedal on F. C. North's Ariel to avoid damage in the event of the footrest being bent.

next year will see many additions to the type. Newey's Levis has a three-speed gear, a two-speed countershaft gear, and the lowest gear is brought into operation when required by simply moving the ordinary gear lever into the "neutral" position. Cock's Connaught is the same he used so successfully in the Scottish trials, with G.H. gear and ⅝in. pitch



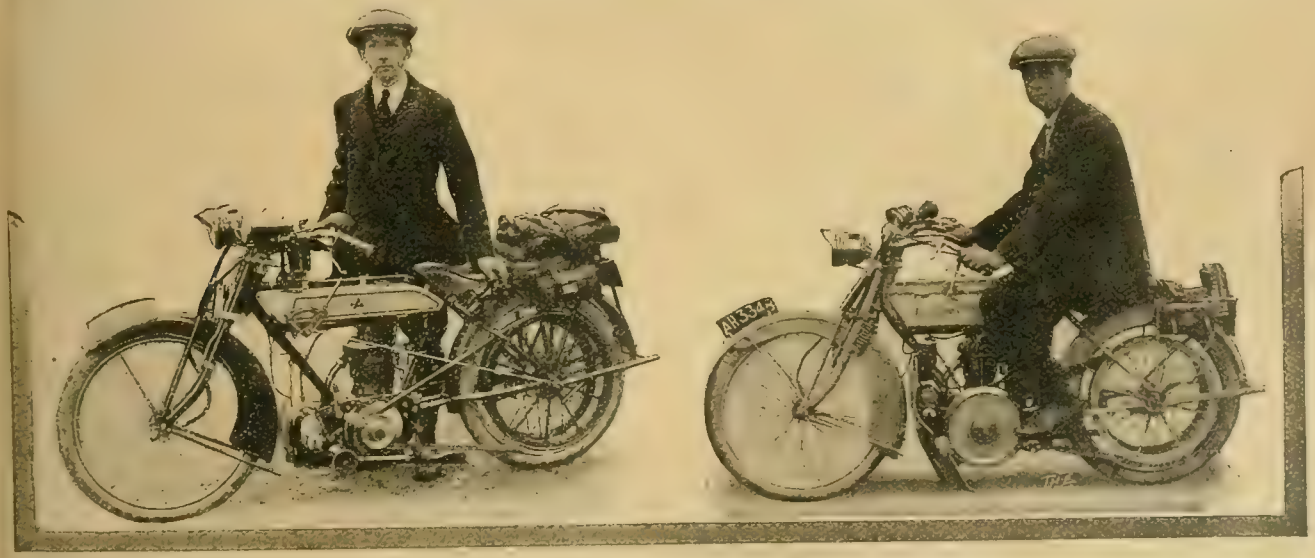
Latest pattern silencer on the Premier single-cylinder machine.

chains throughout. The Bats look very spick and span with their round tanks and all finished in French grey. Mills is still faithful to the Green water-cooled engine on his Zenith. Wide dropped handlebars are fitted to the Motosacoche of J. S. Holroyd, and also to the three Nut-Japs already referred



Exhaust cap on the 3½ h.p. Blackburn.

to. The Clyno sidecar machines are absolutely standard mounts, though Frank Smith is not among the drivers, as he is in France for the Mont Ventoux hill-climb. G.S.



NEW MACHINES IN THE TRIAL. (1) H. Berwick and the 3½ h.p. Hampton, with T.D.C. engine and new Armstrong Mark VII. gear. Observe the change speed lever. (2) C. Q. Roberts on the 3½ h.p. Blackburn, with outside flywheel.

CLUB NEWS.

St. Helens and District M.C.

The first reliability trial of this newly-formed club took place recently over a severe course in North Wales. Result :

		Marks.
1.	J. Middlehurst (6 Zenith)	lost 3
2.	A. M'Tean (3½ Rudge-Multi)	,, 51
3.	T. A. Moulds (3½ Zenith)	,, 54
4.	M. P. Killie (2¾ Douglas)	,, 56
5.	S. E. Bold (2¾ Douglas)	,, 57

Stirling and District M.C.C.

A gymkhana was held at Bridge of Allan on Saturday last. Results :—The cigarette race, A. McNab (3½ Zenith). Glass of water race : R. McAlpine (3½ Humber sc.) Slow race : T. Brown (3½ Triumph). Appearance event for sidecars : R. McAlpine (3½ Humber, Bramble sc.) The suffragette event : The winner, Miss Maitland, should have no difficulty in qualifying for Holloway, as she smashed all the windows provided. See-saw and apple bobbing : H. Brown (2¾ Douglas). Heads and posts : A. McNab (3½ Zenith). Bun tussle : J. Muir (3½ Triumph). Medley : A. McNab (3½ Zenith).

Ayr and District M.C.C.

A long distance reliability trial of 233 miles was run off on Wednesday of last week over roads in the South of Scotland. Of the ten starters seven completed the course, although three of these were late at one of the controls. Route : Dalmellington, Carsphairn, Dumfries, Annan, Longtown, Langholm, Hawick, Selkirk, Peebles, Biggar, Lanark, Muirkirk, Ochiltree, and Ayr. W. Paterson (3½ Rudge multi) had two punctures in the first check, and in consequence was late at Dumfries. T. Hill (2¾ Douglas) also had trouble on this stretch, and did not put in an appearance at the control. J. Gilchrist (3½ Triumph) broke a valve, but managed to arrive to time. Miss May Senior (2¾ Douglas) had plug trouble near Hawick, and afterwards the engine gave trouble. She ultimately finished the route on the back carrier of the 6 h.p. Edmund ridden by A. G. McGibbon. W. Munro (2¾ Douglas) had rather an unfortunate accident, the frame of his machine breaking and throwing him heavily, necessitating his finishing the journey by train. The following lost no marks : H. Clark (3½ Triumph), J. Gilchrist (3½ Triumph), W. Allan (3½ Triumph), J. Meredith (3½ P. and M.), and A. G. McGibbon (6 Edmund-Jap). T. McComb (6 Edmund-Jap) lost no marks until the last check, when a burst tyre caused him to be a few minutes late.

Birmingham M.C.C.

The following are the official results of the Birmingham to Edinburgh run : Winner of P. J. Evans trophy, awarded for best performance by solo rider, S. C. Perryman (3½ Quadrant); winner of Sarsons and Duke trophy for best performance by amateur, H. Ball (3½ Triumph); winner of P. J. Evans rose bowl for best performance by sidecar machine, W. H. Longton (3½ Alldays); team prize for best performance by team of three riders, the Quadrant team (Messrs. S. C. Perryman, T. Silver, and H. Silver). The James team were placed second and Raglan team third.

Gold medals were awarded to the following : T. Silver (3½ Quadrant), H. Silver (3½ Quadrant), H. Ball (3½ Triumph), J. Stevens (3½ James), S. C. Perryman (3½ Quadrant), D. Brown (3½ Rover), A. Young (3½ Abingdon), E. H. Baker (3½ Monarch), R. W. Duke (3½ Rover), T. Pollock (3½ James), C. Wilson (3½ Quadrant), S. A. Rowlandson (3½ Rudge), T. Peck (3½ Ivy), J. Allday (Alldays Midget car), F. C. Sangster (3½ Ariel), A. W. Sarsons (2¾ Sun-Precision), H. Hopkins (3½ Abingdon), H. G. Dixon (3½ James), and G. N. Norris (3½ Raglan).

Silver medal awarded to R. W. Lovegrove (3½ Raglan).

Bronze medals awarded to J. Gray (3½ Abingdon) and T. F. Blumfield (3½ Abingdon).

"The Motor Cycle" Diary of Week-end Club Events.

Aug. 23rd.—Ipswich and District M.C.C. Inter-club competition, Colchester.
,, 23rd.—Cumberland County M.C.C. Knock-out hill-climb, Cold Fell.

FORTHCOMING OPEN EVENTS.

Herts County A.C.

The above club will hold an open half-day trial on August 30th.

Aberdare and District M.C.C.

A hill-climb will be held up Graig Mountain on September 4th. This will include two open and three club events.

The Streatham and District M.C.C.

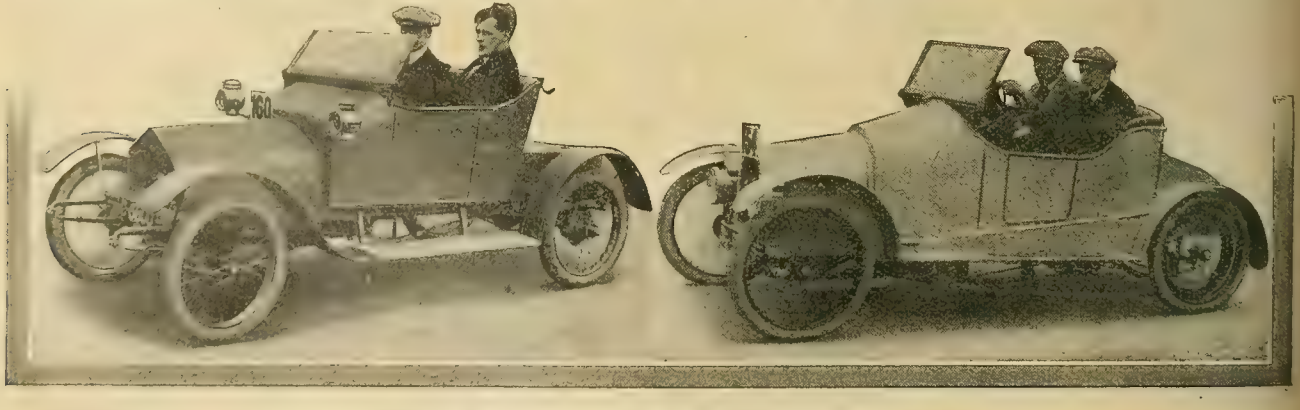
The Streatham Club's open hill-climb is down to be held on August 30th.

Stockport and District M.C.C.

An open hill-climb will take place at Buxton on the 30th inst. There will be classes for standard touring, racing, T.T., and passenger machines. Cycle cars are eligible in the last-mentioned class. Entries close on the 25th inst. to Mr. H. Marsden, The Ash, Florist Street, Stockport.

Bournemouth and District M.C.C.

Open speed trials will be held at Canford Park, Wimborne, on September 3rd. There will be six classes; bicycles to 350 c.c., 350 to 600 c.c., ditto for riders who have never won an award, to 1,000 c.c.; sidecars to 650 c.c., sidecars and three-wheeled cycle cars to 1,000 c.c., and four-wheeled cycle cars to 1,100 c.c. Entries (to Mr. E. L. Herring, 54, Seamoor Road, Bournemouth West), close on the 25th, or at double fees on the 27th.

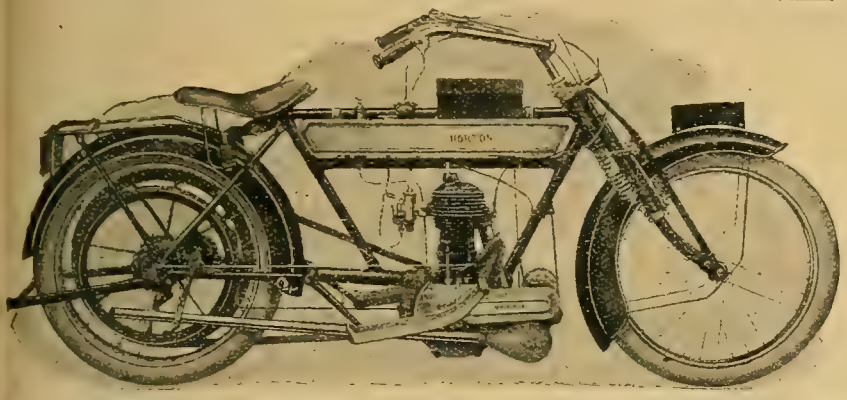


TWO NEW CYCLE CARS IN THE SIX DAYS' TRIALS.

(1) The 8-10 h.p. four-speed shaft-driven J.B.S. cycle car. (2) The Paragon, which has an air-cooled engine and long belt drive.

COMFORT is one of the outstanding features of the unapproachable NORTON

Not only the comfortable riding position afforded by the exceptionally long wheelbase, comfortable footboards, and entire absence of vibration due to perfect balance, but the comfort due to the knowledge that underneath you there is **POWER** and **PLENTY OF IT,** that nothing will go wrong or come adrift, that you are certain of climbing any hill on any road anywhere.



That is what is meant by the combination of the word in **"COMFORT"** with the unapproachable **NORTON.**

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

London to Edinburgh.

Would you kindly inform me which would be the best route to take to go from London to Edinburgh?—H.B.

The route from London to Edinburgh is absolutely direct along the Great North Road. You leave London *via* Highgate and proceed to Hatfield, Biggleswade, Norman's Cross, Grantham, Doncaster, and so on through Newcastle, Berwick, to Edinburgh. It is quite impossible to miss the way, as it is signposted the whole distance. It is approximately 400 miles.

Sidecar Steering Difficulty.

I have a Vindec motor cycle which is difficult to steer with sidecar attached, the front wheel wobbling badly when I remove one hand from the bar. Turning corners is not difficult, but it is easier to turn to the right. The sidecar (rigid) is properly fitted with wheels in line. My own idea is that the trouble is caused by the spring of the Truffault forks being too weak.—C.W.F.

Your solution as to the trouble experienced in steering your sidecar is probably correct. We advise you to go over all the fittings of the Truffault forks to see whether you can find play, and have the looseness adjusted.

Fitting Nail Catchers.

I should be much obliged if you would tell me what is the best method of catching nails picked up by the tyre. I have tried the ordinary nail catchers, made with a piece of thick wire, but find that stones are picked up and lock the wheel, or tear off the nail catcher. This has happened four times in about ten days, and once the front mudguard was badly damaged, the nail catcher being attached to its stays. On this occasion I tried running without nail catchers and each time punctured within ten miles. I ride a 1913 Scott.—P.T.

A very good form of nail, etc., extractor is called "The Bulldog," and is sold by Gamages. It consists of a small piece of curb chain mesh such as is used for scouring purposes. The method of fitting is to place it over your tyre, fitting the front one towards the front of the mudguard, so that it is trailing lightly on the tyre, and the rear one fairly close to the bottom bracket.

Fast on Level: Slow on Hills.

I have a 1907 3½ Quadrant which goes well on the level and starts first turn of the pedals, but will not climb the least rise. It is fitted with a 1912 B. and B. carburetter and latest pattern Bosch magneto. The compression is excellent. It has automatic inlet valve, and it goes well on the stand and on the level, but on the slightest rise the power dies away entirely.—F.C.

It is very difficult to advise you as to what is the matter with your machine without seeing it, but the indications point to the inlet spring being too strong. A strong spring on an automatic inlet valve is all right for high speeds and running fast, but immediately the motor slows down the suction is not sufficient to open the valve. We advise you to try a slightly weaker spring, and see if you get better results.

An Unsatisfactory Sale.

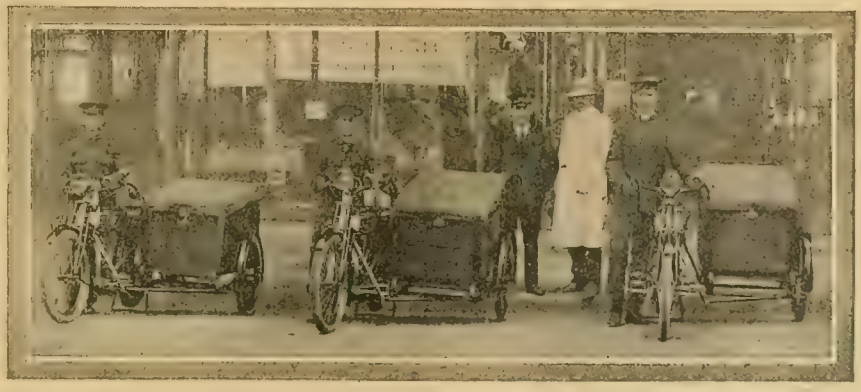
Can you inform me the best way to get the money owing to me from the sale of a motor cycle? I live in Blackpool, and sold it several weeks ago to a London dealer for £24. He gave me £5 down, and promised the balance in a few days. He keeps putting me off with excuses, but does not deny the debt. The only thing is to take legal proceedings. Should I employ a local Blackpool solicitor, or will it be better to have a London one?—J.D.

It depends upon where you effected the deal. If the machine was sold through the post and you were in Blackpool at the time, it is quite sufficient for you to issue a summons from Blackpool, in which case it is not necessary for you to employ a solicitor at all, though, if you take the matter into court, it would be necessary for either yourself, or a solicitor on your behalf, to attend, otherwise the case might go against you by default. If you called at the tradesman's establishment in London, and the deal was done there, it is necessary for the summons to be issued in London.

Repairing Cracked Cylinder.

I have detected a very slight crack across the exhaust valve seating of my 2¾ 1907 Minerva. It runs transversely across and scarcely extends right across the seating. As I am planning a rather long tour, I shall be glad of your opinion as to whether I need apprehend any serious trouble or consequences through this.—W.J.A.

We should not advise you to go out for a long tour with the seating of the exhaust valve cracked. It is quite possible that it may run for a considerable distance without giving trouble, but it will be far better to have this seen to. It can easily be remedied by electrical welding. There are several firms who specialise in this work, whose names and addresses you will find in our miscellaneous advertisement columns. It would be advisable to ask their opinion concerning such a repair before proceeding.



Three 5-8 h.p. Rudge multi G.P.O. combinations supplied to the South African Union Government as parcel carriers for use in Johannesburg.

Combined Roc and Philipson.

I have a 1911 Humber with two-speed Roc gear and sidecar. Could I fit the Philipson pulley to my machine, and use it in conjunction with my two-speed gear? Would my footboards interfere with its control, which I understand is by foot? I am a regular reader of your paper, and notice that several competitors used the pulley in the T.T. —C.J.R.

There is no objection to you fitting a Philipson pulley to your two-speed Humber, if you wish to do so, except that you may have to alter the left-hand footboard, and you would, of course, be able to get a lower gear ratio than you can at present.

Liverpool to Portsmouth.

I should be much obliged if you would advise me of a good route from Liverpool to Portsmouth, avoiding the large towns. I should like to pass through Oxford *en route*.—A.R.H.

Your best route would be as follows: Liverpool, by ferry to Birkenhead, then through Whitchurch, Wellington, Bridgnorth, Kidderminster, Worcester, Cheltenham, Cirencester, Cricklade, Swindon, Pewsey, Upavon, Amesbury, Salisbury, Southampton, Fareham, to Portsmouth. This is the most direct route. If you wish to go through Oxford, you will have to branch off at Kidderminster and go through Alcester, Stratford-on-Avon, Shipston-on-Stour, Enstone, and Woodstock to Oxford, continuing to Portsmouth through Dorchester, Wallingford, Reading, Odiham, Alton, Petersfield, and Cosham.

Correct Way of Descending Hills.

I have a 1912 two-speed B.S.A. motor cycle. I am only a beginner, and so far have had no time to examine much of the interior of the machine. I must explain that I always run "free engine" down any hill of considerable length, to avoid the injury to the exhaust valve which I understand results from frequent lifting. My habit has been on reaching the bottom of the hill to raise the exhaust valve and press the foot control lever into low gear, and then to drop the exhaust. On riding the machine lately I noticed that when I pressed the foot lever after running down a hill there was a grinding sound in the hub, which I had never heard before. Ought I to have started the engine on high gear? And, if so, am I likely to have caused any damage by putting in the low gear when the engine would have started all right in high gear?—M.C.E.

Your method of driving downhill is partly correct. If you run downhill with the engine free and not revolving, you should restart the engine by raising exhaust and gradually engaging the high gear. This should be done before reaching the foot of the hill; in this way you will have the engine revolving and ready to take up the drive when required. Putting in the low gear first might cause damage to the transmission owing to the greater strain imposed, especially if it were done at all suddenly.

Excessive Vibration.

I have a 1911 3½ machine on which the engine vibration seems excessive. On opening throttle on a hill the cylinder rocks backwards and forwards tremendously until I have picked up to a good speed, and then becomes fairly steady as long as the pace is kept. I should be much obliged if you can tell if this can be remedied, as it plays havoc with parts of the machine, especially the petrol pipe union, which I have had soldered three times during last month.—D.C.C.

It is quite impossible for the cylinder to rock about "tremendously" provided the frame does not whip and the holding down bolts are secure. If it is as bad as you say, it sounds a case of having the engine and frame seen to. If you have trouble with the petrol pipe breaking, why not try a flexible petrol pipe, which you could obtain from any large dealer.

Engine Losing Power.

I have a 1910 Douglas motor cycle which has developed the following symptoms. It will take very little air at full throttle and speed has dropped off. It starts all right, but gets hot after three or four miles, slows down, and then develops a knock. The ignition is set right and the jet is clean. Pistons and cylinders also clean, and engine gets plenty of oil. Inlet pipe and fittings all gas tight. If you could give me any advice *re* the above I shall be glad.—W.R.E.

All the symptoms you mention in your engine point to carbonisation of the cylinder, and the valves not being gas-tight, with the further probability that the piston rings have got carbon behind them. Take your engine down, and pay special attention to cleaning the carbon from behind the rings. It is possible that new rings are required. In any case, after three years, there is bound to be an advantage in fitting them. See that the valves are perfectly clean, and closing correctly on the seating.

READERS' REPLIES.

Steering with Sidecar.

Your correspondent, "E.S.," is having the same trouble as I had, and the following are the causes: (1.) The front tube, where sidecar lug is attached, gets pulled over, and will not allow the front wheel to be in centre. (2.) Back wheel gets pulled over by the driving belt, which causes the wheel to be running out of line with the front one; the same applies if the front wheel is not in the centre of the forks.—F. GOFF.

Taking Second-hand Machines to Australia.

I noticed recently in *The Motor Cycle* a query with regard to taking second-hand machines to Australia. I took a second-hand machine to New Zealand a year ago, and was able to pass it into the country without paying duty on assuring the officials that it was for my personal use. They were particular as to its being of British manufacture. The custom laws in Australia are, I believe, the same as in New Zealand.—CHARLES K. WIGRAM.

EXPERIENCES WANTED.

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries below should be addressed c/o The Editor.

"B.G." (Folkestone). — Laurin and Klement twin with low-tension magneto.

"R.B." (Barrow).—1913 Scott, solo riding; consumption, reliability, and flexibility. Also 3 h.p. twin Enfield; flexibility and silence.

"R.M.D." (Dundee).—1913 Douglas with carburetter other than standard. Economy, efficiency, and flexibility.

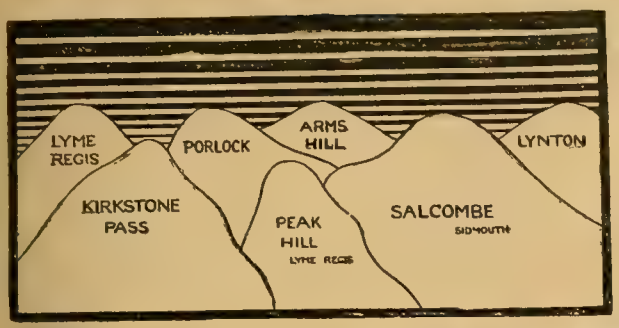
"A.A.G." (India).—Efficiency, reliability, and economy of retreading back covers.

"W.H.B." (Newbury).—Four-cylinder F.N. for sidecar work, compared with 3½ h.p. single-cylinder machines. Reliability, hill-climbing, and consumption.

"W.D.M." (Glasgow).—Henderson and sidecar. Hill-climbing, speed, reliability and consumption.

MOTOR CYCLISTS AT THE FORTH BRIDGE.

A group of Westmorland M.C.C. riders waiting to be ferried across the Firth of Forth at Queensferry, during the reliability trial to Kirkcaldy and back.



THE

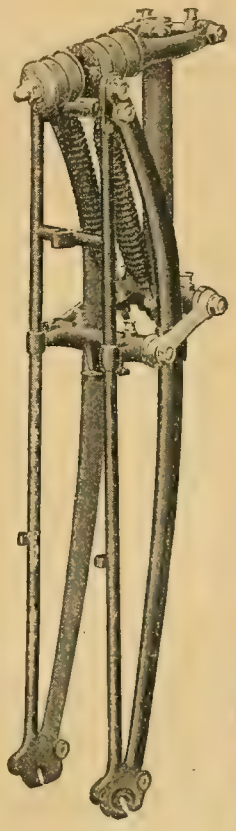
"BRAMPTON BI-FLEX" Spring Fork

Absorbs both vertical and horizontal shocks

Other makes absorb shocks in one direction only—generally vertically.



In the Brampton Biflex Fork the girder is attached to the bottom of the steering column by links, and a pair of springs absorb vertical shocks. The top of the girder is not held by links, but cushioned between two sets of rubber buffers, and moves backwards or forwards under horizontal shocks. These two movements taking place simultaneously absorb all shocks, the buffers damping out any tendency to bounce.

The bearing surfaces are large, and adjustment is provided to take up wear in the links.

This fork gives a high degree of comfort unobtainable by any other make, whilst two years of continuous testing have proved its reliability and durability.

Descriptive pamphlet free on request.

BRAMPTON BROS. LTD., Oliver St. Works, Birmingham.

MORE RECORDS

Fall to the users of the famous

STERNOL

Sternol Elite Motor Cycle Oil.

At the Brooklands M.C.R.C. Meeting, August 9th, in the 350 c.c. 10 Miles Race, G. E. Stanley (Singer), who always uses "Sternol Elite," made new record for distance, and was first in scratch race and second in sealed handicap. In the 500 10 Miles Race G. E. Stanley (Singer) beat record, and was first in scratch race and second in sealed handicap. In the latter event another Sternol user, E. H. Victor (Singer), was first in handicap and third in scratch race. G. W. Baker (3½ h.p. Peerless), using Sternol, had previously beaten the 10 Mile record by 34 4/5 secs. Another Sternol user, M. Anderson, scored successes at the Herts County Meeting; and A.T. Dixon (3½ Singer) gained Gold Medal in M.C.C. Trial, N. Devon, besides making fastest time of class up Porlock Hill.

For speed, for hill-climbing, for economy, "Sternol Elite" Oil is IT.

Get some and test it for yourself. All leading dealers stock it. In case of difficulty write to us.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To insure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

The Six Days' Trials.

EVERY year, in commenting on the A.C.U. Six Days' Trials, we have stated that they are the stiffest that have ever been held, which is, of course, quite right, since, as machines improve, so must trials grow more difficult, to enable machines to be adequately tested. Now, this year the test was made more arduous in two ways. Firstly, by increasing the severity of the course, and, secondly, by making the regulations more stringent. As will be seen on reference to the report, terrible roads had to be traversed, roads perhaps that the ordinary motor cyclist would not dream of using, but roads which tested hill-climbing, the power of picking up, the strength of the frame, and the skill of the driver.

Motor cyclists are rarely afraid of hills, and many dearly delight in surmounting, or attempting to surmount, hitherto unclimbed gradients; but the trials competitors did not like bad-surfaced hills on which a skid on a patch of loose stones might cause a tumble which would deprive them of a first award at one fell swoop, merely through luck, because these difficult hills always occurred in non-stop sections. Unfortunately, the element of luck cannot be eliminated, though it must be admitted that the chances of a fall are certainly increased by bad surface, and in many places the roads of this year's routes were absolutely abnormal.

These are the chief grounds the competitors had for complaints, and they were made on the Tuesday after a long and tedious ride over bumpy surfaces, which harassed the riders' nerves and made them saddle-sore, and, as an official remarked to us, "a man who is saddle-sore is worse off than a bear with a sore head." The grumbling, though by no means groundless, was, we are sorry to say, put forward in a rather unsportsmanlike manner. However, the Union is undoubtedly to blame for stating that no abnormal hills or roads having an abnormal surface would be included, and, though such a statement should never have been published, the officials did their best to repair the error by making the worst hill and the deepest watersplash a means of gaining extra marks by a successful competitor, while the unsuccessful lost nothing. In consequence of the severity of the trial comparatively few gold medals have been awarded, but the public should bear in mind that these trials are not organised to prove how good the modern motor cycle is, but to show what it can do under abnormal conditions, and those which do perform well must be super-excellent.

The average speed of 20 m.p.h. in such country as was traversed was well-nigh impossible to attain, but here again the A.C.U. did its best to remedy matters by adjusting the time limit to suit. Obviously, it would have been better to have foreseen such a contingency, and next year it is to be hoped the same error will not be made.

The organisation was good on the whole. The secretary's general scheme was excellent, and where it failed it was through too much being taken on by one man, and too little delegated to responsible lieutenants.

The press arrangements were very poor. In fact, we may say that results were issued to the competitors but not to the press. Every night preliminary tables of marks lost were posted at the official hotel, but it was well-nigh impossible to copy such a mass of figures amid a surging crowd of competitors.

Nearly all Saturday the judges, Captain Davidson, R.E., and Mr. Archibald Sharp, were examining the machines, and a very thorough examination it was, even though superficial, as, of course, no engines or gears were stripped for inspection. Generally speaking, the machines finished in good condition, distinctly better, in fact, than last year. Among the points which call for criticism may be mentioned control wires, which in many cases were stretched or broken, though in extenuation it may be said that in many instances bad fitting was the cause. Magneto controls were very unsatisfactory, being in many cases jammed, thus causing the drivers to have a fixed ignition. In some cases gear or clutch control pedals were fitted to footrests or footboard supports, which does not appear to be very satisfactory, as in the event of a fall the footrests were the first to suffer. Front brakes were often found to be sticking. The condition of the change-speed gears on the whole was good, but apparently there was often too much play in the dog clutches. This does not, of course, mean the amount of play purposely left by the makers, which was ignored. Several machines finished with leaky tanks, and, of course, there were a number of broken footrests due to falls, and frequently loose or strained mudguards. As regards general cleanliness of machines we regret to say there has been very little improvement.

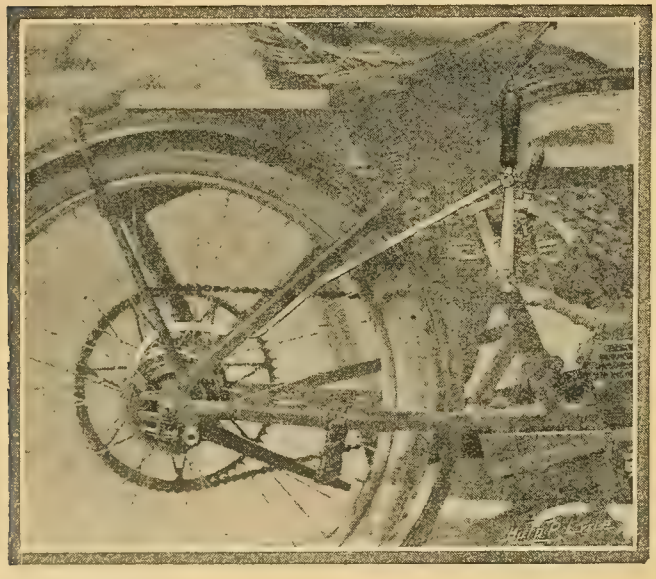
The Pedersen-Alpass Three-speed Hub Gear.

IN these days when motor cycles are expected to carry their owners, when required, up mountain tracks where sheep generally have undisputed territorial possession, it is imperative first of all to have a variable gear, and, secondly, that the gear employed should absorb as little power as possible on its lower ratios and run with as little friction as possible.

We do not propose to enter here into the question of hub and counter-shaft gears, fierce as the battle is, but we have just had the opportunity of examining and seeing in action a novel three-speed gear primarily designed for use in the rear hub, but which can, if preferred, be employed in the counter-shaft of a motor cycle.

This gear is the Pedersen, the invention of Mr. Pedersen, of Dursley-Pedersen cycle fame. The inventor has spent years experimenting in this direction, and the gear under notice is what he has finally decided upon as the best of a long series. It has several claims to notice. In the first place, it is comparatively small, and its total weight is only 8 lbs. Next, the whole of the shell is given over to the gear, which allows large pinions to be employed, and ball bearings with an ample margin of strength on which the pinion straps may revolve, thus going far to eliminate frictional losses. Then the clutch, though on the hub, is external, and is adjusted from the outside in literally a moment by the screwing up or down of a plate with a hammer and small tommy bar. Lastly, the inventor claims that it can be fitted to any existing 3½ h.p. motor cycle without structural alteration to the rear forks.

Mr. Pedersen ascending Birdlip Hill with his Douglas and sidecar fitted with the Pedersen-Alpass hub gear.



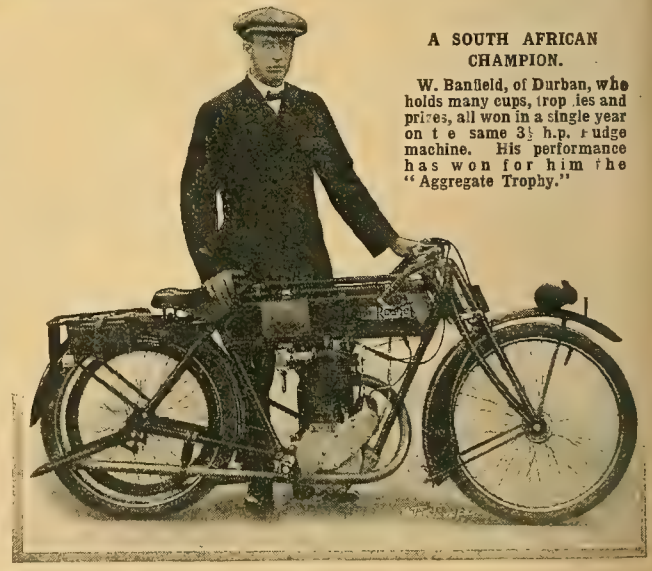
General appearance of the experimental Pedersen-Alpass hub gear fitted to a Douglas.

For the purpose of testing the gear a representative of *The Motor Cycle* attended at Birdlip Hill last week when Mr. Pedersen, after explaining his gear, made several ascents of the famous hill on a 2¾ h.p. Douglas fitted with the new device. The Douglas gear box had been removed *in toto*, and a sidecar fitted to the machine. The drive was by a single direct chain from engine to rear sprocket, and the ratios were 7 to 1 on top, 10 to 1 second, and 15 to 1 on first speed. After making an ascent with one passenger, the inventor brought up his wife and two children in the sidecar, the whole load being hauled up to the last bend on second gear, first speed being required for the last hundred yards or so. Of course, this shows the wonderful pulling powers of the little engine, but it also shows that the gear runs with smoothness and with very little friction.

A feature of this gear is the very small number of parts, the inventor stating that there are only fifty-two in all.

We are informed by members of the Pedersen-Alpass firm that it is hoped to produce the gear in quantities in six months' time, and that the selling price will be very attractive.

One of our illustrations gives a good idea of the general appearance of the gear.



A SOUTH AFRICAN CHAMPION.

W. Banfield, of Durban, who holds many cups, trophies and prizes, all won in a single year on the same 3½ h.p. Rudge machine. His performance has won for him the "Aggregate Trophy."

Occasional Comments by "Ixion"

The Technical Trend of Trials.

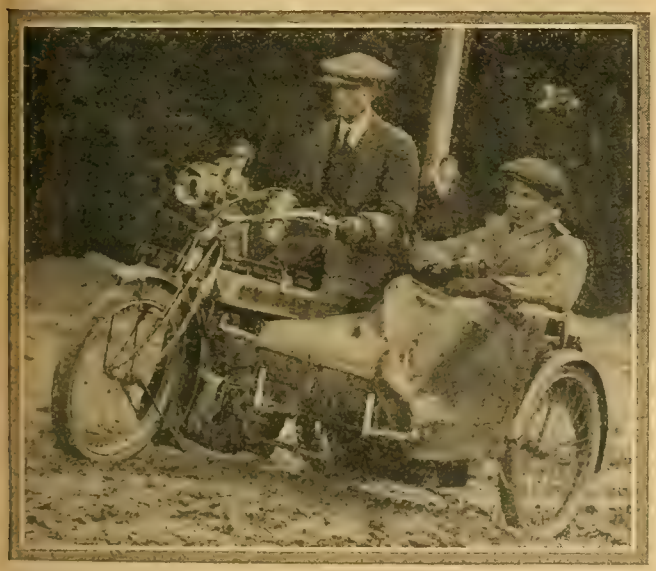
The A.C.U. have taken a definite forward step this year in the direction of making the premier trial a technical event. Not so long ago, the trials were sporting by emphasis. The test-hills were just not too severe for the machines, and it lay with the driver to perfect his tuning, his lubrication, his control of the levers, and his steering; but there was always a doubt as to whether he could earn enough hill-climbing marks to be sure of a gold medal.

As the climbing powers of machines were increased, various factors were imported to prevent a gold medal becoming ridiculously cheap; some of these factors were almost entirely arbitrary, as, for instance, the close timing schedule; others had some distant reference to the real purpose of the trials, *e.g.*, the deduction of marks for a bent pedal or lost brake shoe. But finally the introduction of variable gears, providing emergency ratios of 15 to 1, if desired, has killed the sporting aspect, and, though the rider still has much in his hands, the accomplishment of a really fine performance rests principally with the designer.

That regiment of riders for whom competition work is a delightful hobby, must regret the change; but so far as the general public is concerned, it is desirable that an A.C.U. trial should reproduce the precise scrutiny, the frank, dispassionate statements, and the scientific detail of an R.A.C. certificate. The trials serve a double purpose: (a) they supplement the work of commercial competition in developing the machines by setting them tasks a shade too difficult for all but the best, and (b) they serve to inform the public of the relative merits of different makes. Neither function has yet been fully achieved by any trial. In fact, it is impossible, when so many entries are handled, to answer the root question, which is: "In what condition have the different machines finished?" For it is not practicable to take so many engines and machines to pieces.

Perhaps it may be possible in 1914 to offer a substantial cash prize, say of £50, or even more, for the machine which finishes in the best condition. Under the head of "condition" we should include the degree of carbon deposit, wear of all kinds, whether in the engine or the machine, range remaining on any provided adjustments, tyre life, transmission wear, cleanliness, cable condition—in fact, the total effects of the distance on the machine. A fee of a guinea or so might be charged in addition to the original entry fee; this would limit the number of machines requiring precise examination.

If the complete details of this examination were printed in pamphlet form, the document would prove an invaluable guide to the buying public, for it would show the relative merits of various makes, give an idea of the absolute durability to be expected from a carefully handled machine, and condemn, by its silence, such makers as did not venture to compete for the special condition award. The main defect of all our trials is that they falsely equalise machines of widely divergent efficiency; and they have this effect because the differentiating methods they employ are superficial in character.



The North Canterbury Motor Cycle Club of New Zealand recently held a sidecar trial over 10 miles. The roads were very heavy in parts. Our photograph shows H. Jones, who gained first place on formula, driving a twin Abingdon-engined machine. Mr. Jones gained 983 marks out of a possible 1,000, performing a non-stop run with sidecar and fifteen stone passenger.

Spring Footrest Mounting.

Apropos of my remarks on the damage sustained by a machine when the rider gets a toss, a reader informs me that he has adapted his machine so that it is practically tumble-proof. He carries his lamp very low down, just above the front mudguard, and several falls have failed to affect it. His carburetter levers open inwards, and when shut do not protrude beyond the handle-bar. His ignition is operated by one of the old-fashioned thumbslides, and is safely out of the way. His footrests have a friction grip on the front down tube, and the short drop arms, carrying the horizontal foot spindles, are telescopic, and normally distended by coiled springs.

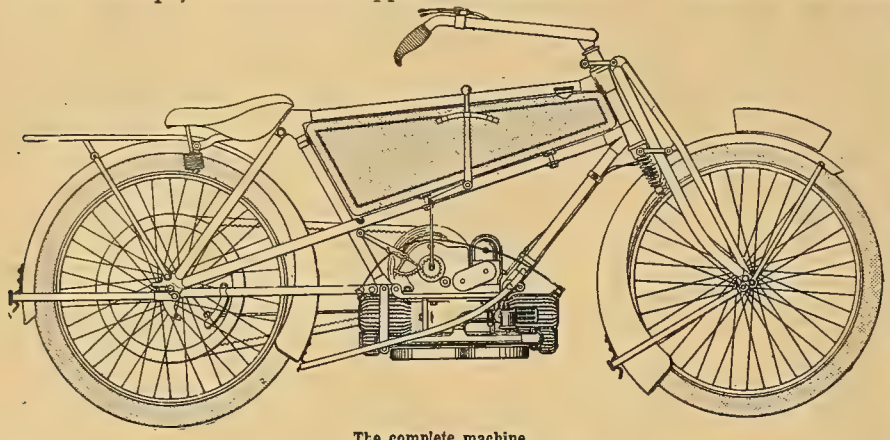
These springs ease the jars of rough roads, and when the rest hits the road in a tumble, the telescopic tubes and springs take the first brunt of the blow, and the friction clip on the frame tube takes the rest, so that he has never yet had to straighten a bent rest.

This design seems to me extremely sensible and practical, though I am a little surprised at the alleged extent of its success. I should have imagined that the blow caused by a fall was too sudden to permit time for the tubes to slide, the springs to compress, and the frame clip to slip. However, he is talking practice, and I am thinking theory, so probably he is right. Manufacturers, please note.

A Horizontal Engine with Vertical Crankshaft.

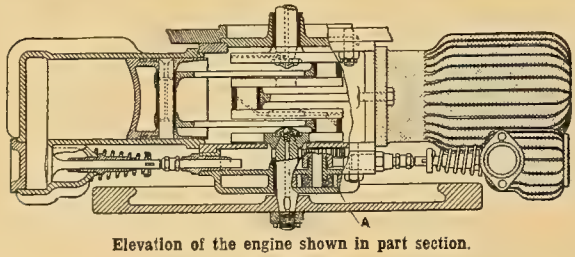
MR. G. F. RAYNER, 37, Chancery Lane, W.C., will shortly place on the market a machine fitted with a horizontal engine which possesses many interesting features.

In the first place, the frame is of approximately diamond shape, and has its opposite corners connected by diagonal strengthening stays. All the tubes, it will be noticed, are perfectly straight, and yet allow a low saddle position to be obtained. The long struts extending from the bottom of the steering head to the back axle are in duplicate, one on each side of the machine, and ensure great rigidity, thus enabling the frame to stand the strain of taking a sidecar.



The complete machine.

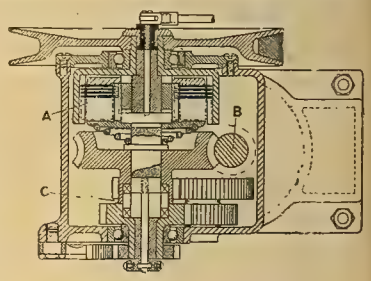
Another interesting feature is that the back wheel can be easily detached. The ends of the longitudinal struts and the back stays support the fork ends, independently of the chain stays, which are made detachable and serve only to hold in position and lock the back wheel. No adjustment is necessary when the back wheel is replaced. The chain stays are slotted and counter-sunk at one end, so that they may be quickly detachable from their connecting bolts, thereby allowing the back wheel to be removed from the slotted fork ends without the necessity of removing the brake shoes, etc. When replacing the wheel it is only necessary to connect up the chain stays by placing their slotted ends over the connecting bolt and then to tighten up the nut, and the wheel is again secure in place, and is perfectly true and in correct alignment.



Elevation of the engine shown in part section.
A. Oil pump.

The tank allows the rider to carry two and a half gallons of petrol and three pints of oil, so that, when it becomes necessary to replenish, a whole tin of oil or petrol can be taken.

The engine and gear box are bolted, one on the under side and the other on the upper side of a special engine plate forming part of the frame, and engine and gear box can be removed as a single unit, by disconnecting the petrol and oil pipes and removing two bolts, or the engine and gear box can be removed separately. The engine is of the twin-cylinder horizontally opposed type, 68 × 68 mm. The crankshaft is vertical and the flywheel is underneath, revolving in a horizontal plane, consequently no gyroscopic action can be set up and the axis of the flywheel is not deflected by the steering. The valves are large, being 1½in. in diameter, and are so arranged that if the valve head breaks it remains in the valve pocket and cannot get into the cylinder. The valve gear and tappets are all contained in the timing gear case, bolted to the under side of the crank case. The timing gear case also acts as an oil sump, and in it is situated a positively driven gear pump, delivering a constant stream of oil through an oil pipe to the top of the hollow crankshaft. This is drilled to supply the proper quantity of oil to each of the main bearings, to the gear box, the big ends, and the cylinders, through the radial distributing passages in the crank webs. The crankshaft projects into the gear box, and is supported in a third end bearing. The crankshaft drives the layshaft through a worm and wheel reducing gear, giving a reduction of 3 to 1. On the layshaft is mounted the two-speed gear, which is of strong and simple design, and a multiple plate clutch, so arranged that end thrust is not communicated to the bearings. Outside is an 8in. pulley mounted on the layshaft, driving the back wheel through a 1in. belt, or a chain and sprocket may be used if desired. The latest type of engine has both cylinders dead opposed, so that one piston has a double connecting rod.



Sectional Plan of Gear Box
(A) Flate Clutch.
(B) Extension of Engine Shaft (driving through worm and worm wheel)
(C) Two-speed gear.

The magneto is mounted forward of the gear box, and is driven direct from the engine through a train of gear wheels.

All the control wires pass through the handle-bar and hollow steering column, giving a very neat appearance. The clutch is either hand or foot controlled The change speed lever is mounted on the longitudinal struts of the frame.

Mr. Rayner has also designed a special two-stroke double opposed engine, working on a semi-Diesel principle, and capable of being run on paraffin.

SECOND DAY (continued): 164 miles. Carlisle, Wreay, Penrith, Orton, Grayrigg, Kendal, Sedbergh, WHITE SHAW MOSS, Ingleton (lunch), NEWBY HEAD, Hawes, BUTTER TUBS PASS, STONESDALE HILL, TAN HILL INN, Brough, Appleby, Skirwith, Glassonby, Kirkoswald, Gumwhitton, Warwick, Carlisle.

Our description of the first two days' runs published in the last issue left off with the report of some of the chief incidents on Gastack Beck Hill and the signing of a protest by 120 competitors against this hill being included in the trials. The feeling of those who protested was that the A.C.U. had gone too far in including a hill with such an abominable surface, a genuine "freak" hill if ever there was one, though the conditions assured all and sundry that hill roads having an abnormal surface would not be selected.

Among other incidents which we noted on this hill was that Longfield (Scott) fell, and afterwards found he could not get going properly, though just what had happened he could not at first trace. At length he found a sprocket loose, and he lost much time before reaching Ingleton.

On the lower bend the following made excellent performances: Featherstonehaugh (Rover), Little (Premier), Holroyd (Motosacoche), Sproule (P. and M.), May (A.J.S.), and North (Ariel). Though a non-competing J.B.S. cycle car succeeded, the one in the trial had to be assisted. The two G.W.K.'s, however, made very neat climbs. Teeton's performance on a James is worthy of praise for he had to pick a track around two fallen competitors, which was a most risky proceeding on the shoal of loose stones.

The Gastack Beck Terror.

Lee's big Zenith slewed from one side to the other and eventually stopped. De la Hay just got up on his Sunbeam with a little foot assistance. After all had gone by we remounted our machine, and came upon Gabriel and his Clément not many yards from Philip Grout (A.J.S. sc.) The French representative simply could not look at the Gastack Beck terror, so elected to retire. He had previously been delayed by tyre troubles. So with Guilloreau's retirement, owing to his inability to climb hills with his high gear, the whole of the French International team were out of the trial by Tuesday midday.

A. D. Arter, who was mentioned as being overdue in the last issue, had now retired, due, it appears, to timing gear trouble. P. Grout, whose retirement was mentioned in the last issue, was riding an A.J.S. sc. and not a Douglas.

After Ingleton the going was excellent past Newby Head to Hawes. The road ascended for miles over the Fells, and in many places the long line of competitors could be seen extending for some distance ahead. At times the road could hardly be called good, but it was a racing track compared to what was experienced later.

The ascent of Butter Tubs Pass was long and winding, while the surface was very rough; the gradient, however, did not appear to exceed 1 in 5, and troubled few of the competitors. On the summit there was a large crowd of spectators, nearly all of whom had come on motor cycles. On remarking on the poor surface to a local rider he replied that it was excellent in comparison to its usual condition as it had been swept. Roberts (Blackburn), Keyte (Enfield), and Cocks (Connaught), whom we had seen cleaning a plug on the moors a few miles back, all came up well. Lea (Lea-Francis) made a good ascent, while Applebee, sen. (B.S.A.) made an exceedingly good climb, which was heartily applauded. Dover (Premier), Platt (Bradbury), Longfield (Scott), Drake (P. and M.), Brittain (Bradbury), and Catt (Triumph) were all travelling well, and while we remained at the summit only one machine, a sidecar combination, failed.

Dangerous Descent.

The descent from the summit of Butter Tubs was frightfully rough, in fact dangerously so, and how the men managed to keep up their twenty miles an hour average no one knows.

After Butter Tubs Pass there was much undulating moorland road, still with stony surfaces, but nothing to

A.C.U. Six Days' Reliability Trials.—

what was in store. According to the official maps, Tan Hill Inn was the next test, but in the non-stop section preceding we came upon a little surprise hill, with a right and left-hand hairpin, which accounted for many failures. Again the surface at the bends was a mass of loose stones. The climb is known as Silver Hill, and on our arrival, after forty or fifty riders had passed, we discovered there was no observer taking notes, though the crowd of locals told us of several failures.

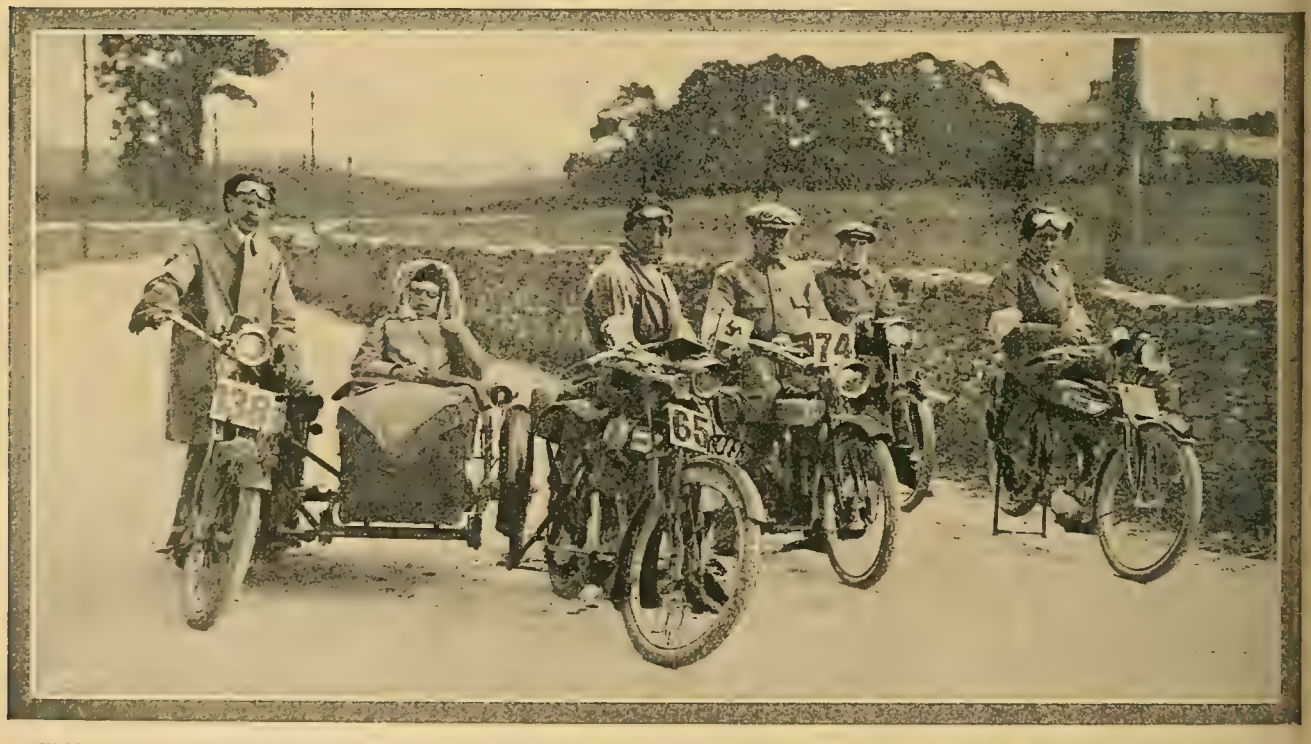
Silver Hill.

Catt (Triumph) punctured at the foot, but restarted easily enough. Ashley (L.M.C.) skidded. The Sunbeams got up very well, Steel in particular, also the P. and M.'s. Chater-Lea came to a standstill, and Phillips (Douglas), who had a clean sheet, fell on the loose stones. Morgan, too, had ill-luck, which, in fact, haunted him all the afternoon. One of the valves of his engine stuck up occasionally, and, as luck would have it, it occurred on the hill. The silencer of Jesse Baker's Scott had got damaged by a boulder on Gastack Beck during the morning, and in climbing Silver Hill the pipe dug into the ground and brought the rider down so heavily that the footboard was broken off; later a sprocket came loose. C. E. Murphy and F. G. Ball failed, though Gibb made a fine performance. As Greaves's Enfield passed we noticed his passenger carrying the sidecar mudguard. He with Alexander (Williamson) were easily the best of the sidecarists observed. Applebee (Scott) made a fine climb, whilst his father on the B.S.A. was as fast as anybody. The L.M.C.'s were doing exceedingly well.

S. Tubb (3½ h.p. Humber) passing through a water-splash on the way to Penrith.

When Charlie Collier appeared he had to work his way past Crosthwaite on a similar machine, who had stopped on the corner. Of the Humbers, Sydney Hine's climb was the best.

Just before we scurried along again the experimental Douglas cycle car, which W. W. Douglas is using to follow the trial, appeared on the scene. It stopped with a choked jet at the first attempt, but A. H. Alexander, who drove, then gave an exhibition climb, the car revelling in the gradient. The engine is water-cooled, and placed across the frame, and a three-speed and reverse gear box is provided, this being



Waiting outside the Penrith control on the second day of the trials. Among the riders may be seen W. H. Egglington (6 h.p. Enfield sidecar), D. M. Brown (3½ h.p. Rover), C. Lester (3½ h.p. P. and M.), F. C. North (3½ h.p. Ariel) and one of "The Motor Cycle" representatives.

A.C.U. Six Days' Reliability Trials.—

designed with the engine on the unit system. The final transmission is by shaft.

The Tan Hill Climb.

The first part of the climb was up a short sharp pitch of 1 in 5, fearfully loose as usual, and here was collected a fair number of spectators. The amount of interest taken in the trial is really extraordinary, and the people in the North are certainly keener adherents of the pastime than those in the West. At the end of the non-stop section one is in sight of the highest inn in England. The surface was awful, and the descent on the other side for many miles was as bad as any road we have seen, and here as in the other rough places it was difficult to stay in the saddle.

For five miles this sort of thing continued, until we felt sorry for those who had to average 20 m.p.h., for such a speed was almost suicidal. However, the surface improved gradually, and after a sharp bend the competitors passed under a railway bridge where the beginning of another non-stop section was marked.

Here Chater-Lea, jun., whose sidecar stay was broken, and several others halted before entering the section where no stopping was allowed. The road was good for a stretch, and then a rough byroad was taken. Why this was made a non-stop section was hard at first to understand, when on rounding a bend in the road a watersplash was suddenly encountered. It was not a very bad one, but it accounted for no little belt-slipping, which was awkward, as a fairly stiff ascent ensued shortly after. May (A.J.S.) dismounted, which was surprising, as one would have thought a chain-driven machine would have successfully negotiated a watersplash. Chater-Lea took it well, Baker (Scott) came through very fast and nearly skidded over. De la Hay (Sunbeam) and Hands (Williamson) negotiated the ford satisfactorily; Scoon (N.U.T.) suffered belt slip, but did not dismount; Browne (James) came through particularly well; and Hine (Humber) although he was in a non-stop section pulled up and looked to the ford before attempting to go through it.

The Harding and Summers cycle car, driven by P. D. Walker, taking the water-splash near Penrith.

Sproston (Clement), Mills (Zenith-Green), Hawkes (Rudge), Keel (N.U.T.), Brittain (Bradbury), and Marston (Triumph sc.) all dismounted. C. R. Collier (Matchless sc.) came through carefully. Vale (Rover) suffered from belt slip but proceeded.

Once the main road was joined the going was splendid through Brough and Appleby. The writer was now well in the rear of the procession and began to pick up the stragglers. Chater-Lea, now out of the competition, was seen in a blacksmith's shop at Long Marton, where the smith was forging up a piece of iron to repair the broken stay. Tamplin's G.W.K. was also out of the running and left in a stable in this village. A little farther on Lees (Zenith) was repairing a puncture, one of many, which eventually caused his retirement. Townshend (Trump) was also noticed repairing a tyre.

Shortly after this the final non-stop section was entered. Here another watersplash was encountered, which was the worst of the three met with in the day's run. Kerr (N.S.U.) dismounted. Townshend (Trump) got off, and, walking over the stepping stones, pushed his machine through the water. Walker (Harding and Summers cycle car) got through, but one of the belts came off afterwards. Altogether this ford, which was near Glassonby, accounted for over sixty failures.

The day's run has provoked much discontent owing to the execrable surface of the roads on the course and the inclusion of watersplashes in the trial. While it is just possible for the solo machines to cover the course and keep up the required average speed, it is very hard for the passenger machines to do so, and the ruts in the grass grown tracks render it particularly difficult for the three-track machines. To-night there was a general meeting of the competitors, when a general "strike" was discussed as a protest to the A.C.U. Between thirty and forty offered to retire, but as a majority was needed it was decided that the trade riders should wire to their firms asking whether they might withdraw.

It has certainly been a terribly stiff day, and most agree that the conditions are worse than in the Scottish Trials.

A. W. Walden (3½ h.p. Premier) and J. Hoult 3½ h.p. Matchless) climbing Greyhound Hill, Kendal.

THIRD DAY: 147 miles. Carlisle, Dalston, WARNELL FELL, (flexibility test), Caldbeck, Mungrisdale, Threlkeld, Dunmail Raise, Grasmere, RED BANK, Skelwith Br., Coniston, KIRKBY MOOR, Ulverston (lunch), HIGHER LATH, Broughton-in-Furness, KILN BANK, Broughton-in-Furness, Ulpha, THE SEAT, Eskdale Gn., Gosforth, Calder Br., COLD FELL, CROSSDALE, Cockermouth, Mealsgate, Thursby, and Carlisle.

This day's run was generally regarded as the fairest test so far. Instead of the bitter feeling against the A.C.U., such as existed after Tuesday's journey, one and all were generally agreed that there was really nothing to grumble at except, perhaps, the hairpins. The chief event of the morning was the slow speed and acceleration test on Warnell Fell, a gradient of about 1 in 12 to 1 in 8. Competitors first crawled over a distance of fifty yards at slow speed (minimum time 12s.), and immediately accelerated to the top of the hill.

It would be impossible to mention each performance individually, but we considered the following especially good: Oliphant (Premier), Kerr (N.S.U.), Newey (Levis), Little (Premier), Morrison and Tessier (Bats), Newsome (Rover), Keiller (G.W.K.), Stanton (Bradbury), Hardee (Triumph), Hunt (Campion), Drake (P. and M.), Haslam (Zenith), Applebee (Scott), and Gibson (Bradbury).

Percival (Douglas) stopped his engine in the slow test. A further attempt was allowed with the same result. Taylor (B.S.A.) either misread the conditions or his clutch slipped, for he was a long time getting up speed. It was very obvious to the onlookers that the three-speeders were at a distinct advantage. Several of the smaller two-speed machines had to utilise their low gears for the slow and fast sections, relying upon engine revolutions alone. An intermediate ratio was badly wanted in some cases.

On the whole the performances were good, though the majority appeared to enter the slow section too fast. Macdonald (Norton), Westwood (Triumph), and Gray (Rudge) travelled well on the slow section and fast on the fast section. Ashley (L.M.C.) and Milner (Levis) did not appear to be moving very rapidly on the fast section. Mundy (Triumph travelled very slowly but zigzagged about the road so as to extend the time. De la Hay (Sunbeam) travelled very slowly, but slipped his clutch a good deal, and then fairly fast for the rest of the distance. Morgan performed particularly well, but made rather a noise changing up after the slow test. That fine old sportsman, Applebee, sen. (B.S.A.), travelled slowly and then accelerated well. Sumner (Zenith), May (A.J.S.), Francis (Lea-Francis), and Cooke (A.J.S.) had to slow down by cutting out. Slater (J.B.S. cycle car) made a capital performance as the 90° J.A.P. engine showed excellent flexibility. He was foolish enough to change up too quickly, and stopped. Another try was allowed, when he travelled rather slowly up the fast section. C. R. Collier (Matchless sc.) was impeded by this cycle car and also was allowed another try; he then performed in excellent style. Several competitors followed Mundy's example of not keeping a straight course. Morrison (Bat), Colliver (Indian) who slipped his clutch, Pearson (Clyno sc.), Alexander (Indian), though not quite so slow as Colliver, did not slip his clutch and travelled more steadily, Moffat (Douglas), and Gibb (Douglas) all performed most satisfactorily, while North (Ariel) was quite one of the best. Walker (Harding and Summers cycle car) did not attempt to travel slowly. Bassett (Sun-Villiers) retired at the flexibility test owing to tyre trouble.

B. Alan Hill (7 h.p. Indian) and D. H. Noble (3½ h.p. Rover) ascending Gastack Beck.

A. V. Sumner (Zenith) passing fallen competitors on Gastack Beck.

A Friendly Lift.

Here mention must be made of the extreme kindness shown to one of our staff who was stranded through an ill-fitting cover. First Mr. Chater-Lea took the unfortunate on his cycle car to the foot of Warnell Fell, and then Messrs. Martin and Selwyn on the Singer cycle car drove

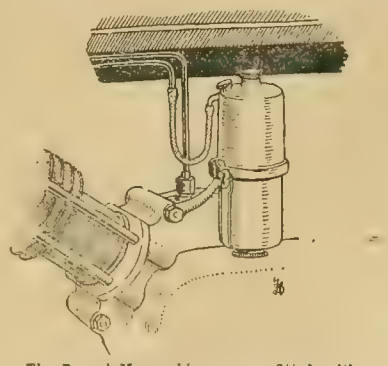
Gastack Beck, the hill which was included in Tuesday's route, and which was ultimately ruled out. E. H. Lees (8 h.p. Zenith) is seen passing stranded competitors just past the second bend.

him round the course. The little vehicle performed magnificently and took every gradient in splendid style. On our way towards Ulverston we passed Percival (Douglas) in trouble with his tyres and Pollock (James) whose chain had broken and damaged the sprocket and clutch, in consequence of which he retired.

On Higher Lath Hill, near Ulverston, Jepson (Zenith) ran off the road, stopped, and restarted, Blamire (Hazlewood) went on to the grass but made a clever recovery, Kerr (N.S.U.) fell, Marston (Triumph) dismounted, Baker (Scott) ran into the side but made a marvellous recovery, and Blackburn (Morgan) nearly upset but managed to right the vehicle. Lower down Steel (Sunbeam) skidded on the loose stones, shaved the wall, but, owing to his excellent clutch, got away again; Bradbury (Norton) turned to the side to let a sidecar pass, ran up the bank, and, though he kept his balance, stopped his engine and had difficulty in re-starting.

Kiln Bank.

Our next point of vantage was Kiln Bank, a mountain pass amidst some of the most lovely scenery we have yet seen in this beautiful district. The hill ascended from the valley with many a turn, the gradient was not much worse than 1 in 5½, and the surface was very fair. While we were posted at this point we noticed the following excellent climbs: Little (Premier), Keiller (G.W.K. cycle car), Gibson (Bradbury sc.), Applebee, sen. (B.S.A.), Silver (Quadrant sc.), Morrison (Bat), Newsome (Rover), Jepson (Zenith), and Stanton (Bradbury). Five competitors, however, were unsuccessful, most of them failing at the worst corner about two-thirds of the way up the hill. Far away in the distance the competitors could be seen ascending the first stages of The Seat, a stiff climb which mounted up the hillside in *lacets*. At the foot of Kiln Bank Neumann (Rudge) was in serious trouble with his tyres. The Douglas experimental cycle car ascended in excellent form. Here Murphy (Douglas) retired owing to losing his way and other causes. Good climbs were made by Mundy (Triumph), Fenn (B.S.A.), Andrews (Ariel), Garland (Chater-Lea sc.), Teeton (James) de la Hay (Sunbeam), the two Scott machines, Colliver and Alexander (Indians), D. Alexander (Williamson sc.), Heyte (Enfield), Morgan (Morgan runabout), Sawer (Premier), Lester (P. and M.), North (Rover), Milner (Levis), Collier (Matchless sc.), and Gibb (Douglas), who had suffered a puncture earlier in the day. Taylor (B.S.A.) and Steel (Sunbeam) both assisted with their feet; Applebee (B.S.A.) ran into the bank; Hands (Williamson) skidded and almost stopped; Dixon (James) came up well, skidded, but saved himself. Ritchie (Rudge) dismounted.



The P. and M. machines were fitted with generators on the crank case and plated pipes to lead the gas to the lamps.

On the Wrong Road.

Numerous riders went wrong at the foot of The Seat and had to ascend it twice. Notices clearly indicated that it had to be taken after the loop, which included Kiln Bank, but some busy-body at the corner sent every competitor up this way irrespective of whether it was his first or second round.

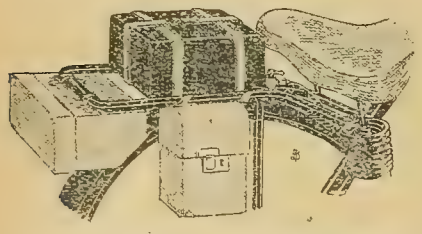
The afternoon run was full of incident. F. W. Applebee, sen., skidded on a bend and damaged his leg, and, before he had realised it, most of the petrol ran out of his tank; he had perforce to obtain paraffin at a cottage. Edmond (Humber) fell on one of the numerous hairpin bends and damaged his footrest, and Steel (Sunbeam), in avoiding some mountain sheep, grazed a rock, which broke his footrest bar in half. He continued with his legs dangling down, so that he and Jesse Baker, who fell on Tuesday, are in the same predicament. Sproule had another puncture outside Ulpha to-day in a non-stop section, which is very unluckly for the P. and M. team. In descending the Seat, Holroyd (Moto-accoche) unfortunately got a stone between the mudguard and the tyre, which locked the front wheel and threw him, hurting his wrist. He continued steering one-handed, but came off again on one of the right angle bends.

Hereabouts, George King, a familiar figure in these trials, turned up with a huge bunch of bananas and handed one

A.C.U. Six Days' Reliability Trials.—

to each of the competitors as he passed.

Near Gosforth, the Harding and Summers cycle car was withdrawn, the driver having lost his way and being generally "fed up" as he put it, and, later, near Cockermouth, Blackburn had to retire with his Morgan, the piston and cylinder having broken. This leaves but three cycle cars of the twelve which started two days previously, viz., Morgan, G.W.K., and J.B.S.



Arrangement of spare petrol tank and tool bags on Hugh Gibson's 3½ h.p. Bradbury.

There was a goodly crowd at Crossdale Hill, which was included in the last of Wednesday's non-stop sections. The gradient was, however, easy compared with what had been encountered, but three acute bends rendered the climb more difficult than it would otherwise have been. While waiting for the competitors to come along we tried the experiment of two up on the 2¾ h.p. Sunbeam we were riding, and this healthy little mount took its extra load up the hill with the greatest ease. There were no real failures though Guest (Matchless) was unlucky enough to have the change-speed lever jump out of engagement and bring his machine to a standstill before he could right matters. The Stevens brothers on the A.J.S.s took the hill very quietly, and Newey's Levis went up on the middle gear. Richards (Sun-Precision) evidently expected something bad when he saw the crowd for he smiled knowingly when he got round the top bend. Macdonald (Singer) was one of many who never used their lowest gear.

Corners Galore!

There was no hill worthy the name on the run to Carlisle, but the corners! Really, 20 m.p.h. is asking too much on such a tortuous route, yet by taking advantage of their opportunities when main roads were met with, the riders usually had a few minutes to clean their machines down. H. F. Edwards (B.S.A.) retired with loose flywheels, and Mills (Green-Precision) suffered timing gear trouble, and was towed to a station.

The casualty list was a long one on Thursday, for on arrival back at Carlisle we learned that Andrews (Ariel), who had started late owing to tyre troubles, skidded on the watered tramlines in Carlisle, and a motor lorry ran over his rear stays and wheel. Teeton (3½ James) charged a bank and burst a tyre on a bad corner near Carlisle, whilst Baker (Scott) punctured and rode two miles on the rim to get in to time. The crowds along the route cheered the riders on. At every lane, village, and street corner there was an interested group, and the police were most useful, but still one or two lurked behind bushes and gave the riders a fright now and then. News came in that Brittain (Bradbury) had retired near Bothel.

On Wednesday evening the adjourned protest meeting of competitors was held, and telegrams from the trade riders' employers were read. It was resolved to report the matter to the Motor Cycle Manufacturers' Union, and request that body to appoint a representative to inspect the course and decide whether it was fair and according to the regulations issued.

Oiling arrangement on the new Matchless. The oil is led to the back of the front cylinder and the surplus passes to the clutch mechanism.

The same evening the Auto Cycle Union announced that after due consideration it had been decided to rule out Gastack Beck and the watersplash, and no marks would be deducted for failures under these heads. This decision has naturally pleased many competitors as it means restoring gold medals to a large percentage.

H. Greaves (6 h.p. Enfield sidecar) at first bad bend on Gastack Beck.

OFFICIAL RESULTS OF FLEXIBILITY TRIALS.

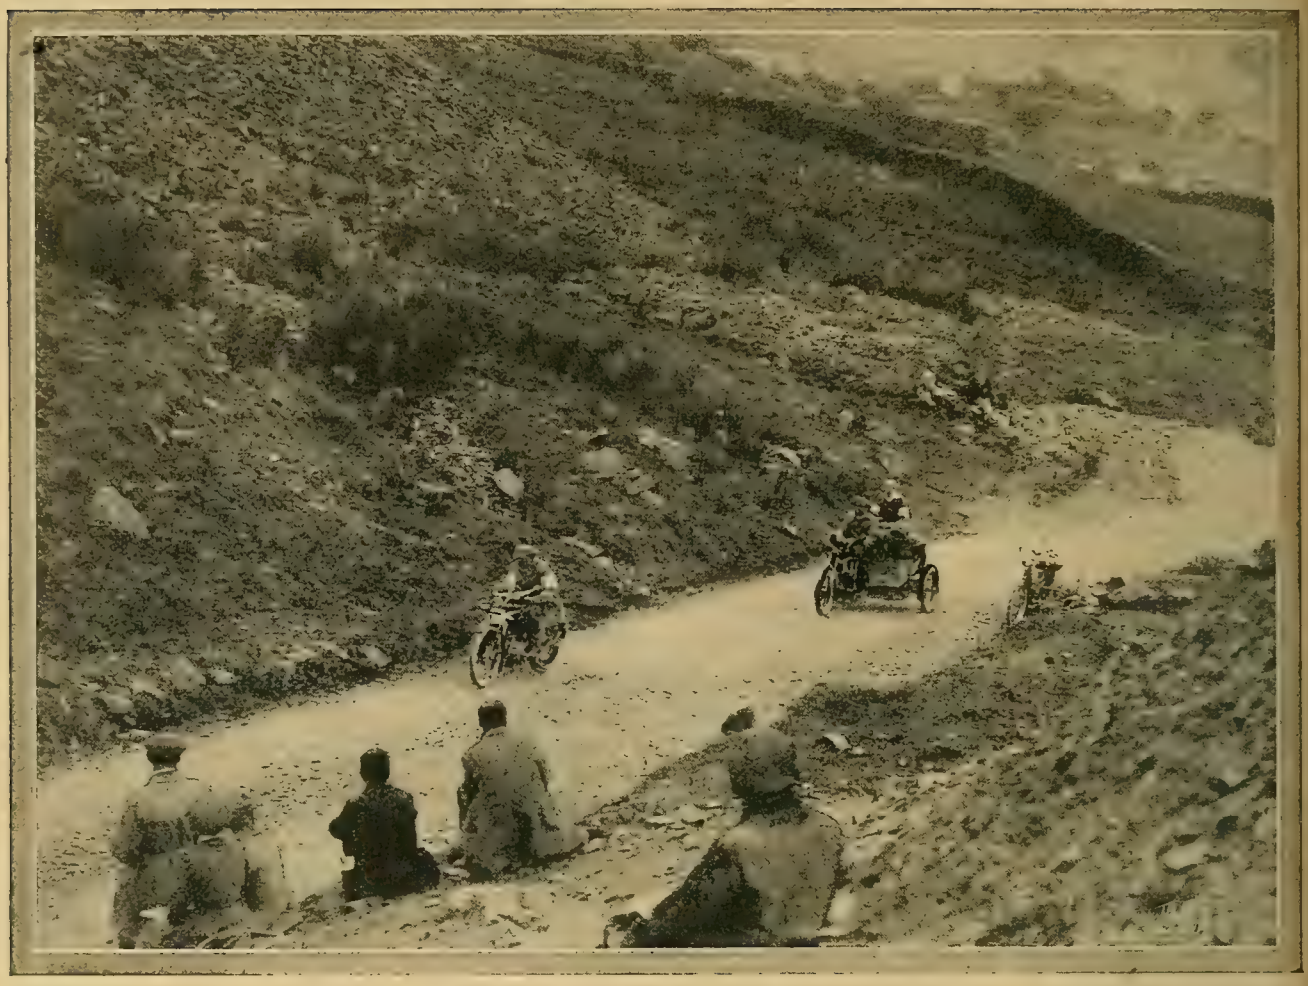
The average gradients of Warnell Fell are 50 yards of 1 in 11 (slow), 200 yards of 1 in 7.9 (fast).

R. S. Sesson (3 h.p. N.U.T.) and A. V. Sumner (8 h.p. Zenith) on the hairpin on Silver Hill.



J. B. Westmorland (3½ h.p. Fremier) and J. Rutherford (8 h.p. Matchless sidecar) ascending Eutter Tubs Pass.

FOURTH DAY: 170 miles. Carlisle, Warwick, Carlatton, HARTSIDE, SLATE HILL, Wear Head, Westgate, WHITE EDGE, HORSESHOE HILL, Edmundbyers, Lanchester, Durham (lunch), Brancepeth, Wolsingham, Eggleshope, Middleton-in-Teesdale, Newbiggin, GRASS HILL, Knarsdale, Hallbank Gate, Talkin, Warwick, detour to Wetheral, and Carlisle.

Those who had borne the discomfort of wearing oilskins in the broiling sun of the three days previously, had cause to be thankful to-day, for the morning was dull and rain beat on the window panes as the unwilling competitors were roused from their slumbers. The gruelling nature of the trial was telling its tale, for many could not be pulled out of bed, and, as a result, we heard of quite a number who had to forego breakfast to start to time. Interest in the trial increased daily, especially seeing that the severity of the test had weeded out so many and the teams of three were considerably reduced in numbers. The Ariel team are most fancied, probably as a result of their striking success in the Scottish Trials. The L.M.C. riders had been doing exceptionally well until Ashley was put out on Wednesday with engine trouble, and another team had depleted ranks this morning when Noble (Rover) discovered a crack in the handle-bar attachment of his mount and elected not to start.

A Severe Route.

Thursday's run to Durham took the riders over indifferent roads, mostly by-lanes and moorland tracks, and it was considered by Mr. Loughborough, who selected the routes, the most severe of the five. At Renwick, the commencement of the first non-stop section, quite a crowd of riders availed themselves of the opportunity to effect adjustments. Then followed a long trying climb up Hartside, a left-hand turning on to the main road proving very troublesome, and again the right-hand turning to Alston. The roads were very slippery and treacherous, the grease vying with the Derbyshire quality, with the result that several stopped. Curiously enough, the rises on Thursday seemed particularly to favour three or four speeders. The gradients were not severe except in isolated cases, though too steep for top gear. The main road through Alston is paved with large cobbles and the rain had given them a greasy coating, which troubled the riders not a little, especially so in a non-stop section. In all eight came down and lost marks. Near Alston we encountered Browne (James), who had suffered exactly the same trouble as Pollock, the engine chain breaking and damaging the gear. We can only suppose that the absence of a slipping clutch caused the chains to snap.

The Highest Point in the Trial.

Catt (Triumph) and Hawkes (Rudge) had further doses of tyre trouble. The roads were very potholey to-day, and, together with the damp, caused great discomfiture. After Alston, the climb up Nenthead, the highest point reached in the trial, 2,056 feet, was commenced. The summit was obscured by clouds. Nenthead rises in stages, but it was not sufficiently steep to trouble the now well-tested machines. Two unmarked watersplashes after a bend had the effect of testing frames to the limit. Among those we have noticed riding very consistently may be mentioned Cook on the A.S.L. He is delighted with his Precision engine, and fears no hills, taking them all in his stride. The same remarks apply to S. T. Tessier and his twin Bat.

Fortunately the rain, which had left us on the summit of the pass from Nenthead, held off for some time, consequently the first real hill-climb of the day fortunately took place on dry roads. The

A.C.U. Six Days' Reliability Trials.—

hill, which is known locally as Peat Hill, rises abruptly from the village of Westgate, where a turn to the left is taken. It possesses many bends and has a maximum gradient of about 1 in 5, but the surface is very good, though a trifle loose. The machines performed very well, and only about nine or ten failures have to be recorded. Among the early arrivals was Applebee *père*, who has done some excellent hill-climbing during this trial. The hill ends with a sharp turn to the left, on which the surface is somewhat loose, followed by a sharp pitch of about 1 in 6 or worse. Just at the bend there is a by-road, up which Applebee stated he thought the course lay; anyhow he came to a standstill, and after this incident Mr. J. R. Nisbet, one of the stewards, had the arrow moved to a more conspicuous spot. To-day there seemed to be a marked improvement in the driving of the competitors, the corners were taken more steadily and more neatly, and it appears that the more inexperienced of the drivers are beginning to improve by experience. The Scotts, as usual, were beautifully driven and glided gracefully round the corners to the summit.

A. J. Stevens (6 h.p. A.J.S. sidecar) on Butter Tubs Pass, which was included in Tuesday's run.

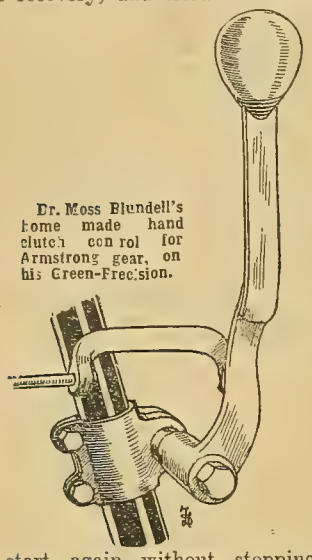
Some Good Performances.

Excellent climbs were made by Sproston (Sunbeam) and his colleague, De la Hay, Castognoli (L.M.C.), Gray (Rudge), Silver (Quadrant sc.), Greaves (Enfield sc.), Newey (Ariel), Freeman (Clyno sc.), Fenn (B.S.A.), Ball (Triumph), Mundy (Triumph), who is a particularly clever exponent of this make, Vale (Rover), Westwood (Triumph), Macdonald (Norton), the other Rover riders, Newsome and Featherstonhaugh, Scoon (N.U.T.), the P. and M.s, Collier (Matchless sc.), Cook (A.S.L.), the Douglas riders, the Indian team, and, in fact, the majority. Those who appeared to shine conspicuously above their fellow riders, both by the manner in which their machines ran and the way in which they were handled, were Turvey (Enfield sc.), Little (Premier), and Keiller (G.W.K. cycle car), while another cycle car which performed in good style was the J.B.S. Morgan came up splendidly on top to the last corner, the negotiation of which brought him down to first. As the driver opened the throttle on on engaging the low gear the cack wheel made the stones fly. Certainly Morgan knows how to get the best out of this handy little runabout. Alexander (Williamson sc.) and Applebee, junior (Scott) both climbed with water boiling. Neumann (Rudge) came up with his engine knocking. Stevens (A.J.S. sc.)

Wednesday's third non-stop section. D. Bradbury (4 h.p. Norton) and a P. and M. rider on the first corner of Crossdale Hill.

A.C.U. Six Days' Reliability Trials.—

made a good ascent but his machine appeared to be leaning outwards from the sidecar. Nott (Clyno sc.) came up with his right foot in an awkward position pressed up against the change-speed lever. Ritchie (Rudge) approached the last corner too fast, skidded, fell, made a quick recovery, and tried to turn round



Dr. Moss Blundell's home made hand clutch control for Armstrong gear, on his Green-Precision.

and start again without stopping his engine, but he failed to do so. Breeze (B.S.A.) came up knocking. Just short of Stanhope the competitors turned to the left and proceeded towards Edmundbyers. After climbing Horseshoe Hill the non-stop section came to an end.

There is a useful rise out of Stanhope known as Crawleyside, and, having observed the performances on previous steep hills, we halted here to note particularly which competitors could take a long twisty ascent of about 1 in 8 on top gear. The big Zeniths, of course, were very fleet, likewise the three 7 h.p. Indians. Others who never had to resort to their low gears included Hands (Williamson), Scoon (Nut-Jap), Applebee (Scott), de la Hay (Sunbeam), Cuffe and Walden (Premiers), May (A.J.S.), Tubb (Humber), Mundy (Triumph), Fessier (Bat), Newsome (Rover) and Little (Premier).

We noticed, too, many footrests bent, and other machines with no rests at all, which tells its own tale. Several of those who retired earlier in the week were out again to-day watching the competitors. Among them Murphy (Douglas), Cooper (Humberette), and Grout (A.J.S.) S. J. Hine, riding a 3½ Humber, wears no overalls, but just an ordinary overcoat; he was soaked when he got back on Thursday. In all, 111 riders climbed Crawleyside whilst we were observing two, Garland (Chater-Lea) and Hawkes (Rudge), passed very late.

But *the* hill of Thursday's route was encountered a mile or two from Durham. It is termed "a little Honister." First the riders were directed up a narrow roadway around farm buildings, through a chicken run, one rider said, while another thought he was being directed to the ash-pit. Then a sudden twist, and an appalling gradient was struck—probably the steepest in the whole trial, and to make matters worse it was greasy. Fully 50% failed. Two hardened riders, Fenn (B.S.A.) and Mundy (Triumph) confessed they were frightened. The grumbling as to what constitutes an "abnormal surface" and freak hill was reopened, and at lunch time there was talk of another protest to the A.C.U.

The Return Trip.

The first twenty miles from Durham was easy, and after lunch there was no non-stop section till just after Stanhope. Here a turn was made to the left; the road doubled back on itself over a stream, and then a turn to the right was taken. Next a level crossing was traversed, and the competitors found themselves at the foot of a hill known as Softly Bank. The surface was much the same as on Peat Hill, but the gradient seemed a trifle less severe. As on Peat Hill, there are many corners, but on Softly Bank these appeared to be more acute. As on other hills along the course, there was a large crowd of spectators. To return to the hill-climb, Busby (Ariel), who climbed well, together with other riders of that make, was the first to arrive. Gutgemann (Veloce) and Francis (Lea-Francis) made good ascents. Hunt (Campion) hugged the off side of the top corner rather too closely, but got up fairly well. Particularly good ascents were made by Macdonald (Singer), who rode magnificently, Greaves (Enfield sc.), who passed Ross (Triumph) after rounding the corner, Newey (Ariel), Fenn (B.S.A.), Westwood (Triumph), Ball and Gibb (Douglases), Baker (Scott), Mundy (Triumph), and the J.B.S. cycle car. Crosthwaite (Matchless) came up without his passenger, Ritchie (Rudge) skidded and nearly fell, and Bees (L.M.C.) narrowly missed a spill. Morgan, as usual, made a fine climb, and the same may be said of the performance of C. R. Collier. Longfield (Scott) and Haslam (Zenith) also made performances which deserve mention.

Rough Weather.

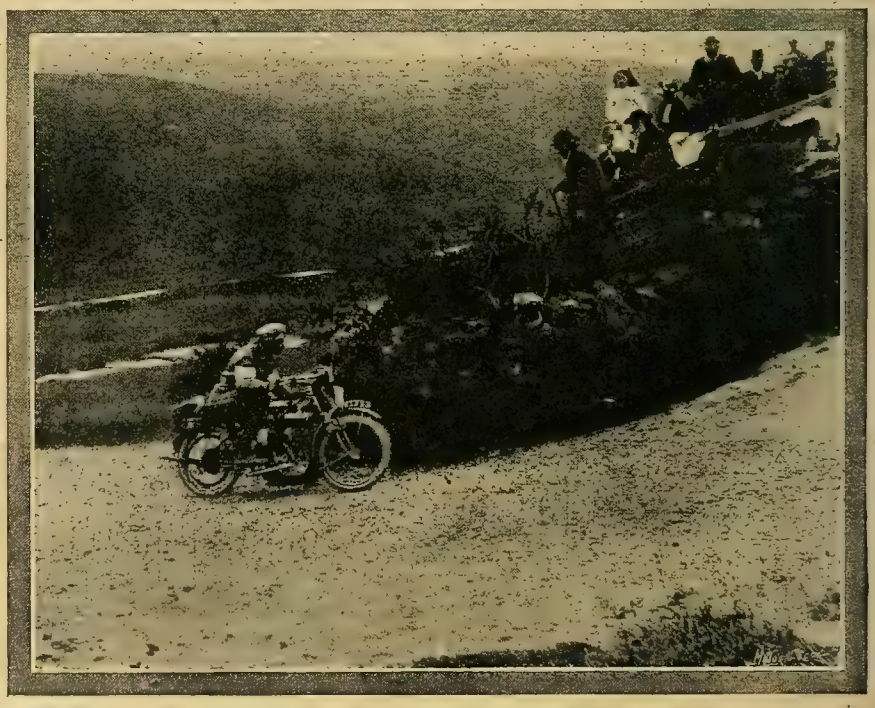
The long climbs over the moors against a howling wind will long be remembered. Two-speeders were obliged to crawl for a mile or two at a stretch, the surface being rough in addition. One hairpin following a watersplash required extreme care. We rode with Norman Lea for several miles. His Lea-Francis has improved every day since Monday when he stopped on the test hills due to overheating, and he is now thoroughly happy. He told us he was averaging 115 m.p.g. with the Everest carburetter.

Drake (P. and M.) had an involuntary stop to-day, due to such a simple thing as the high-tension wire touching the tank. Anyway, he loses four marks, and four more for charging the bank on Holmside Hill, though he restarted immediately on the clutch. Keyte damaged his silencer on the same hill, and one of his exhaust pipes is missing.

Once again competitors had the pleasure of sampling those Alston cobbles, some slithering down the hill crabwise. It had been drizzling for some time, and it now developed to real rain. The last non-stop section was from Hallbank Gate to Carlisle (15¼ miles). It commenced with the ascent of High Fell, a rough grass-grown track of 1 in 5 gradient.

High Fell.

The belt drive users knew what was in store, and stopped to shorten and dry belts. As soon as Greaves (Enfield sc.) struck the gradient, water ran down the tank and dripped on to the plug and stopped him, though he kept the engine running and rectified matters immediately. This was a case of genuine ill luck, for Greaves's sidecar has gone wonderfully well. He was one of the few passenger machine drivers to climb



A. G. Fenn (3½ h.p. B.S.A.) at the top bend of Silver Hill, Keld.

Group of competitors at the bottom of Warnell Fell waiting for the flexibility test. J. B. Sproston (2¾ h.p. Sunbeam) is seen starting.

Little Honister Hill this morning F. W. Applebee, sen., stopped with a slipping belt. After this last climb of the day there was a stretch of the worst type of Colonial road which continually jolted the riders out of the saddle. Big stretches of unrolled stones too prevented the maintenance of the 20 m.p.h. schedule. Gibb (Douglas) drove the last fourteen miles on a flat tyre, but, despite this, finished to schedule.

FIFTH DAY: 178 miles. Carlisle, Carleton, Plumpton Wall, Penrith, Hackthorpe, Shap, Forest Hall, Kendal, BRIGSTEER BROW, Underley Hall (speed trials), Staveley, GUMMER'S HOW, Winster, Bowness (lunch), Low Wood Hotel, HOLLIN BANK, Thwaite Head, DEVIL'S GALLOP, Satterthwaithe, Hawkeshead, Ambleside, KIRKSTONE PASS, Patterdale, Ullswater, DACRE BANK, Greystoke, Ivegill, and Carlisle.

It was still windy and dull when, at 7 a.m., the competitors were despatched on their last day's run. The chief event of the morning was the speed test in the grounds of Underley Hall, Kirkby Lonsdale.

On Friday morning Keiller's passenger never turned up at the start. Martin, the driver of the Singer cycle car, sent on his friend to take the missing man's place; then waited for the latter, drove out, caught up the G.W.K., and exchanged passengers—a truly sportsmanlike action.

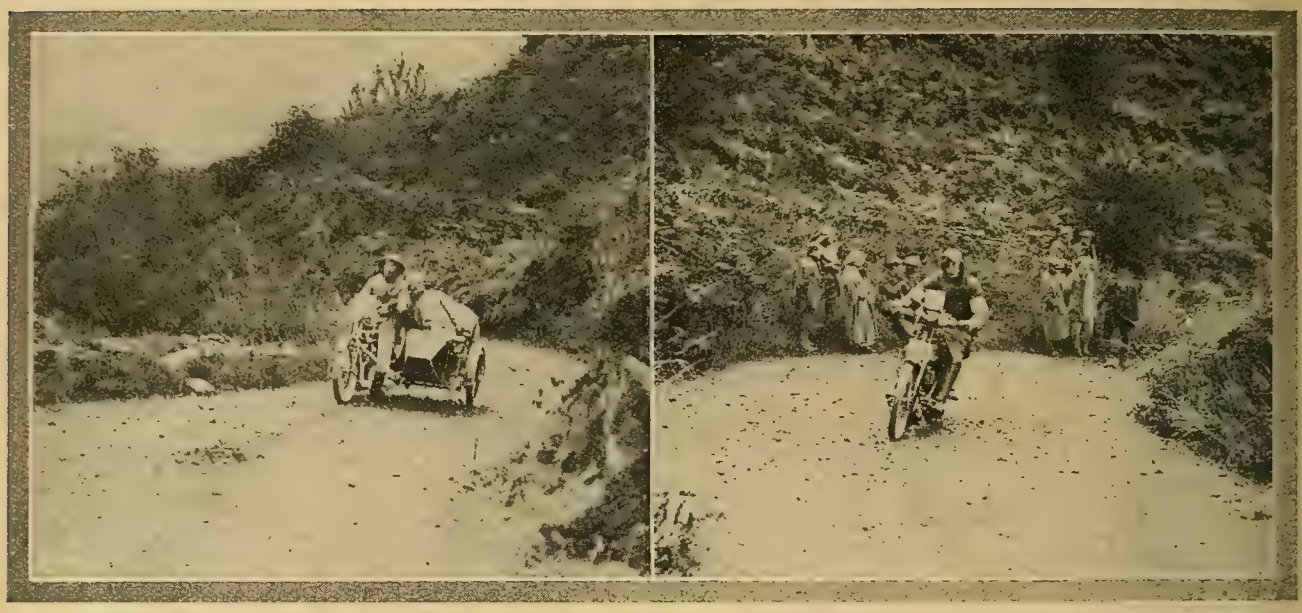
Last night we learned of the withdrawal of the Williamsons on the day previous. Hands suffered a broken engine chain, which damaged his gear, and D. S. Alexander, in passing another rider, hit a boulder at the roadside and hopelessly damaged his gear box. Cocks charged a culvert at speed and broke the frame of his Connaught, and water penetrated to the armature of Knowles's Humber and caused his retirement.

The route was to Penrith over the easy side of Shap, but so strong was the wind that only with difficulty, and by means of lying flat on their machines, were the riders able to keep on top gear. The descent of the steep side even had to be accomplished under engine power.

The hill leading out of Kendal caused one or two failures. Before the commencement of the non-stop section, including the speed tests, most of the riders availed themselves of the opportunity to shorten belts, raise gears, and generally make hurried adjustments.

The speed attained by some of the riders was splendid, especially in view of the fact that the trial was held on the last day. About forty-five miles per hour was the speed of the 3½ h.p.'s; several larger machines delighted the many spectators by exceeding 50 m.p.h.

F. H. May (5 h.p. A.J.S.) and H. Greaves (6 h.p. Enfield sidecar) climbing Tow Top.



C. R. Collier (8 h.p. Matchless sidecar) ascending Tow Top in the rain.

W. E. Cook (A.S.L.) nearing the top of the hill.

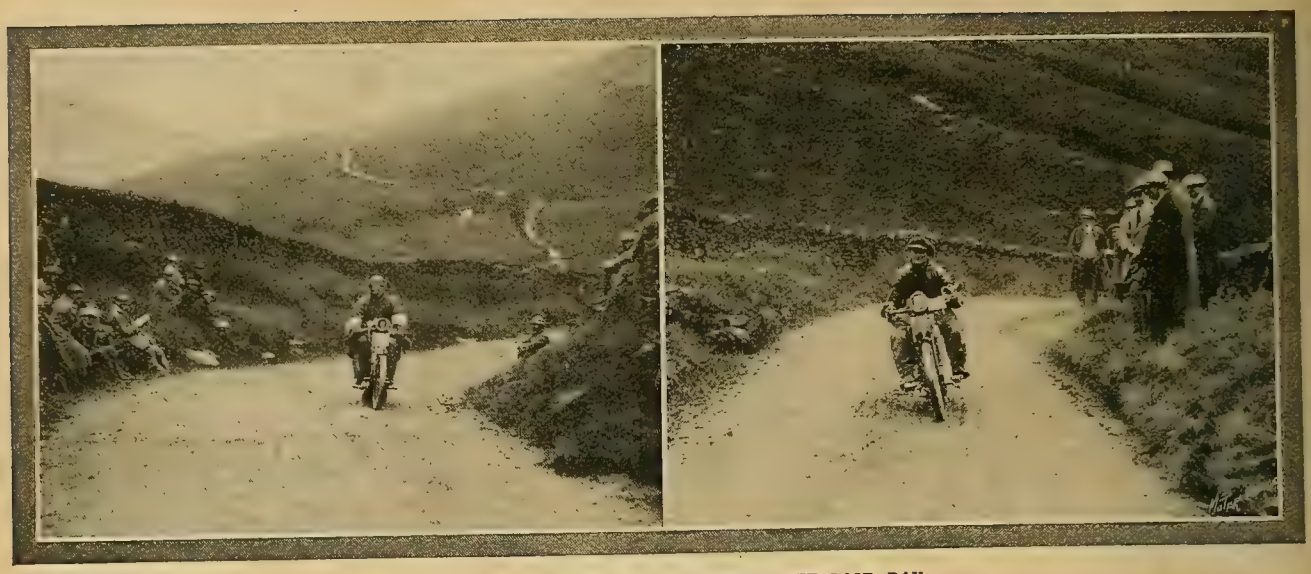
E. B. Slater (8 J.B.S.)	34.52	25.89

W. Westwood (3½ h.p. Triumph) at the S bend on Brigsteer Brow.

During the speed trial the rain fell heavily, but, fortunately, the roads were not very greasy. The route lay through Casterton and Kirkby Lonsdale, and just after leaving Underley Park we followed the J.B.S. cycle car, which was running very well; then, pushing on, we passed it and followed a group of competitors towards Sampool Bridge. About this point the main road was left and a bad piece of by-road followed to a point where the main road was again joined. Then ensued a straight and easy run along the Ulverston Road till the beginning of the first non-stop section of the day was reached. Here, as usual, the competitors had a few minutes in hand and enjoyed a short rest. Soon Tow Top Hill, the first of the two climbs in this section, was reached. The approach is excellent and the surface, though still rough, has been much improved. No less than a dozen corners have to be negotiated before the summit is reached, and the worst gradient is about 1 in 4. On reaching our observation point we met Stanton, who had had to withdraw at Brigsteer through a stone breaking the pulley flange on his 3½ h.p. Bradbury, having done well up to this point. He had reached Tow Top on the carrier of an A.J.S. sidecar combination. As usual the P. and M.s performed remarkably well, and Morgan's runabout came up so fast that he actually succeeded in overhauling a 3½ h.p. solo machine. Newey (Levis), Cuffe (Premier), Dixon (James), and Colver (Enfield) all came up well in a group. This bunching is most regrettable, as it causes the men to impede one another on a narrow road

C. M. Keller (8 h.p. G.W.K.) and W. H. Eggington (6 h.p. Enfield sidecar) ascending Gummers How on Friday.

A. J. Stevens (6 h.p A.J.S. sidecar) and F. C. North (one of the winning Ariel team) on the same stretch.



SCENES ON KIRKSTONE PASS ON FRIDAY, THE LAST DAY.

A. C. F. Andrews (3½ h.p. Ariel) on one of the bad corners. W. H. Longton (3½ h.p. Alldays) higher up the hill.

where there is no room to pass. However, it is their own fault, and with a little care it might be quite well avoided.

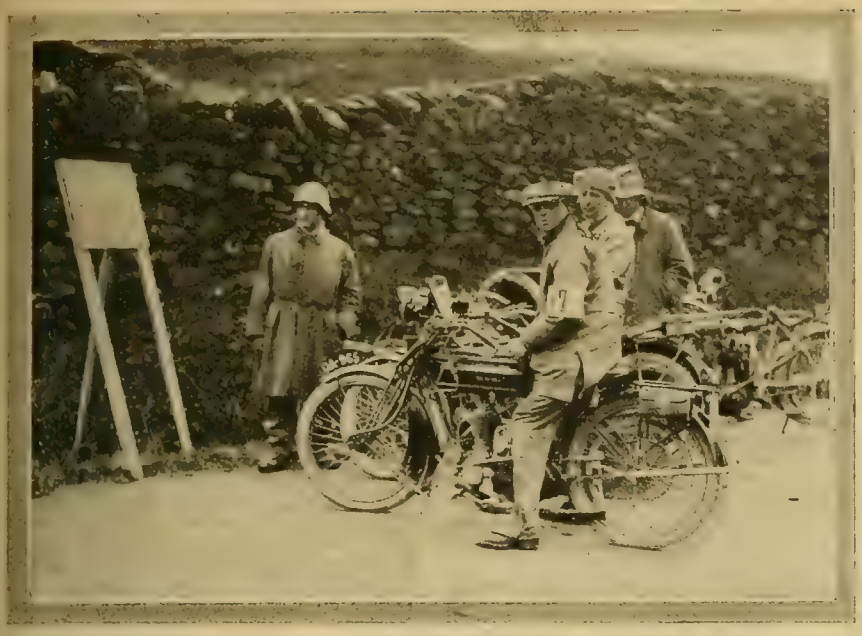
Here, as on other hills, observers who had undertaken to help the A.C.U. failed to turn up, with the result that Mr. Greenhill, one of the stewards, who arrived on his Premier, had to press several spectators into service. It is a pity that people who offer their services should let down the Union in this way, presumably because it was a wet morning. Sawer (Premier), Hawkes (Rudge), who was very noisy, Nott (Clyno), Moffat (Douglas), and Egginton (Enfield sc.), came up very well, while Keiller (G.W.K. cycle car) made a particularly fine ascent. Other specially good climbs were made by Stevens (A.J.S. sc.), Morrison (Bat), Westmoreland (Premier), Guest (Matchless), Drinkall (Quadrant), Little (Premier), Tessier (Bat), Hardee and Catt (Triumphs), and Gibson (Bradbury sc.) Other good climbs were made by Haswell (Bradbury), Haslam (Zenith), Roberts (Blackburn), and Sproston (Sunbeam). Failures were fortunately few and far between. The J.B.S. was travelling particularly well when it suddenly pulled up near the summit, and on the bonnet being opened it was found the carburetter was loose. After tightening it a good restart was made, but it failed again just above the last corner for the same reason. Sproston, on his too highly geared Clément, dismounted and ran. His was a really plucky exhibition, as while the other Clements have been withdrawn, he is determined to get his through this strenuous trial at all costs. Sealey (B.S.A.) failed on several hills to-day owing to his having broken the operating spindle of his gear through a fall early in the morning, which left him with the top gear only in operation. Ritchie (Rudge) stopped on the summit with a broken valve rocker. Both these men subsequently withdrew on Friday. Breese (B.S.A.) assisted with his feet. One of the Scott machines was noticed to have a broken footboard. From the top to the main road the surface was very rough, but, fortunately, this condition did not last long.

Cleaning and tuning up at Kirkstone Pass ready for the finish at Carlisle. Among the riders may be seen H. V. Colver (Enfield), B. Alan Hill (Indian), G. E. Cuffe (Premier), and another.

Observations on Gummer's How.

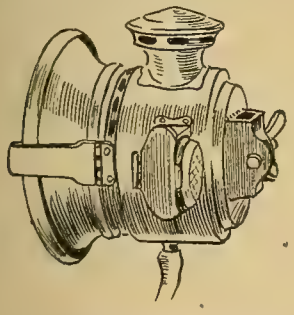
The next item of interest was Gummer's How Hill, also included in the non-stop section. Both these hills, it may be remembered, were included in the A.C.U. One-day Trial held in the autumn. Gummer's How, we may remind our readers, is a fairly straight ascent, though the surface is rough. It rises 550 feet in a mile, and has a 1 in 5 gradient at the beginning.

Keiller (G.W.K. cycle car), Westmoreland, and Little (Premier), and the J.B.S. cycle car made conspicuously good ascents. Crosthwaite (Matchless sc.) stopped owing to a burnt out brake band which had previously caused him trouble. Hine (Humber) failed on the very last yard of the gradient. A good ascent was made by a Clyno sidecar combination belonging to one of *The Motor Cycle* staff, which had been driven from London by road and has followed the trials in excellent form. Lunch was served at the Stag's Head Hotel, Bowness. After the usual luncheon interval, the lake side road was followed and at Waterhead a turn to the left was taken. Here an A.C.U. notice board was fixed which read as here depicted so that no mistake could be made. As we have mentioned previously, the arrowing was splendidly done.

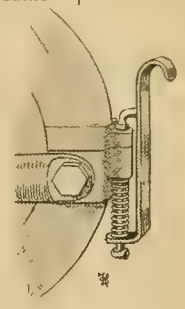


T. C. de la Hay (2¾ h.p. Sunbeam) and A. V. Sumner (8 h.p. Zenith) at the top of Kirkstone Pass, the end of the non-stop section.

The first climb of interest after lunch was down in the programme as Hollin Bank, but it was known locally as Tarn Hause. It was approached from the main road by an acute angle bend which caused several stops, and was fairly steep and very rough. Some distance up a very sharp hairpin had to be negotiated, at which several exciting incidents took place. Here Gibb (Douglas) gave a beautiful exhibition of driving, Collier (Matchless sc.) and Little (Premier), all members of the British (the sole surviving international team), came up splendidly. Truly the A.C.U. selection of a team to represent England was a very wise one. Wray (Clyno sc.) also shone conspicuously, while equally good performances were made by Eggington (Enfield), Newey (Levis), and Gibson (Bradbury), who is really an artist in handling a single-cylinder sidecar combination. Colliver (Indian) came up well but used his clutch freely; Alexander (Indian) made a good ascent; Hill (Indian) fell. He is lame in his left leg, and, trying to steady himself with this, it gave under him and he came over. Admiral Sir R. K. Arbuthnot—an interested spectator—offered him a bandage for his cut finger, which Hill said was not sufficiently injured to require it. The bandage, however, came in useful for Breese (B.S.A.), who fell and also damaged his right hand. His tank was leaking and he carried three oil tins full of petrol slung round his waist. Breese and also Applebee (B.S.A.) both suffered a tumble owing to taking the corner too fast, and, curiously enough, Applebee's tank was also leaking badly. Later in the day the leaking petrol caught fire, and Applebee told us that he put out the flames by accelerating and making the wind blow them out. Colver (Enfield) assisted with his feet at the acute corner. Smith (Bat) came up with his front stand down. Keiller (G.W.K. cycle car) made a good ascent, but had only just sufficient luck to get round. His cooling water was boiling. Guest (Matchless sc.) made quite a sensational ascent. He took the corner much too fast and upset. The engine, of course, buzzed round merrily, and though he tried hard he could not stop it. Meanwhile Admiral Arbuthnot and several others righted the fallen combination, which, as the engine was still running, and the low gear was in engagement, started off up the road. Quick as thought the plucky driver leaped into the saddle and was away. This he claimed as a non-stop, but as others assisted him the stewards thought otherwise. Jepson (Zenith) dismounted, and Castagnoli (L.M.C.) assisted with his feet. After Tarn Hause came Bessie Brow, which accounted for several failures. Here the road was so narrow that the spectators had to stand behind the hedges, and the passenger machines were sent by a different route.

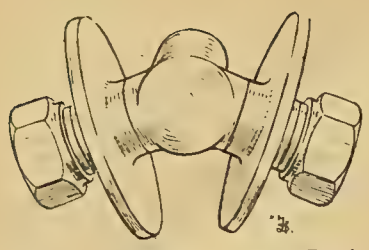


A neat Lucas sidecar lamp with rear green light, noticed on one of the competing sidecars.



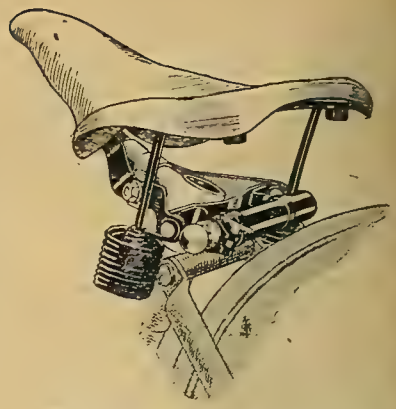
A simple quickly detachable clip for the chain guards is a recent refinement on the Lea-Francis machines.

F. A. Applebee (3½ h.p. Scott) and C. R. Collier (8 h.p. Matchless sidecar) ascending the last portion of Kirkstone Pass from Ambleside.



Novel design of inlet pipes on the Lea-Francis ridden by Norman Lea. Each branch is fitted with a flexible expanding diaphragm on the aneroid principle.

The competitors then looped back to Ambleside through Hawkshead. Here began the ascent of the worst side of the famous Kirkstone Pass, which ascends 1,300ft. in nearly three miles. It was in excellent condition, and though the maximum gradient is 1 in 4½, there were few failures, probably because there was a strong wind aiding the machines. The summit, where we watched the ascent, was occasionally obscured by clouds, and at this point there was a greater gathering of motor bicycles than we have ever seen before. Though Ambleside was left in rain after lunch, the weather fortunately cleared and continued fine for the rest of the afternoon. It is a long, tiring climb for the first half of the ascent. This is followed by a slight ease, consisting of a short pitch down hill, while the pass terminates with a series of sharp bends and stiff gradients. The 2¾ Douglas on which one of our staff has followed the trials made an excellent ascent. The star ascent was made by Sumner (Zenith), who has won both the flexibility and speed tests, to the figures of which we would especially draw our readers' attention. Among the good performances we may mention the Ariels, Triumphs, Rudges, P. and M.s, Scotts, and Bats. Keiller (G.W.K. cycle car) came up well, but the water was boiling. Crosthwaite (Matchless sc.) came up without his passenger, Macdonald (Singer) dismounted and ran, Keel (N.U.T.) assisted with his feet, and Kerr (N.S.U.) failed. Other very good performances were made by Gibb (Douglas), Ball (Douglas), Morgan (Morgan) runabout, C. R. Collier (Matchless sc.), Gibson (Bradbury sc.), and the Clyno sidecar combinations. Greaves (Enfield sc.) came up with his passenger abnormally seated on the carrier.



The oil gun on the Lea-Francis is now carried in a case fixed to the saddle frame, in which position it is out of the way, but readily accessible.

Norman Lea (3½ h.p. Lea-Francis) and H. Blamire (5-6 h.p. Hazlewood) on Kirkstone Pass.

Incidents en Route.

After travelling along the shores of Ullswater the competitors took Dacre Bank, a rise of 400 feet in nearly three-quarters of a mile, of which, however, they made light work. Thereafter, the run to Carlisle was over an easy and fairly straight road—a relief after the difficult route followed throughout the week. Among the incidents of the day's run may be mentioned Francis (Lea-Francis), who suffered a choked petrol pipe thirteen miles from the finish. Hoult (Matchless) was knocked over by a runaway horse during the afternoon's run. He was flung head first into a ditch, and when he extricated himself he found his machine standing wrong side up on the saddle and handle-bars, and though it was pretty well knocked about, he succeeded in finishing. May (A.J.S.) had a narrow escape while on the road running alongside Ullswater. A big car coming in the opposite direction passed him so closely that the front wing brushed his hand and bruised it. Macdonald (Singer) arrived in Carlisle twenty minutes before time, giving as an excuse he did not realise he was there. Little, who had performed so well throughout the trial, lost marks through arriving too early, as he thought that the extra allowance of time, which was granted by the A.C.U. officials owing to the severity of the course, referred to men ahead of as well as behind schedule time.

List of Awards.

We append the complete list of awards to date, though one or two amendments may be made. The method of awarding medals is as follows:

In Div. I.	Marks	90% or over	= gold medals.
	,,	75% ,,	= silver ,,
In Div. II.	,,	85% ,,	= gold ,,
	,,	70% ,,	= silver ,,
In Div. III.	,,	80% ,,	= gold ,,
	,,	65% ,,	= silver ,,

TABLE OF OFFICIAL RESULTS SHOWING MARKS LOST AND AWARDS.

DIVISION I.—CLASS B.: 350 c.c.

C. T. Newsome (3½ Rover)	118.6	104	2	100	Gold medal
C. Lester (3½ P. & M.)	116.27	100	12	88	Silver medal
R. G. Mundy (3½ Triumph)	143.51	100	3	97	Gold medal
G. J. Shemans (3½ Triumph)	114.18	102	82	20	Bronze medal
W. Westwood (3½ Triumph)	114.68	104	0	100	Gold medal
A. W. Walden (3½ Premier)	116.48	100	9	91	Gold medal

E. B. Slater (8 h.p. J.B.S. cycle car) taking an acute corner on Bollihope Common (Thursday afternoon.)

NOTES BY THE WAY.

One can sympathise especially with those who were obliged to withdraw on the last day.

The rain on the last two days rendered the trial much more severe, and was the direct cause of more than one retirement.

Tuesday, Thursday, and Friday have variously been given as the worst days of the test. It is curious that most retired on the easiest day—Wednesday—when thirteen withdrew.

At last Scottish Trials riders agree that a course in England can be made more severe than any Scottish Trial held up to the present.

It was generally remarked that the competing machines retained their power remarkably well. In the case of some engines, for instance, one could stand on the pedal or foot starter against compression almost indefinitely.

The Ariel team have done wonderfully well in carrying off the team prizes in both the six days' trials of 1913, viz., the Scottish and English tests. It is a long time since belt-driven machines asserted themselves in such gruelling competitions.

The cycle cars were frankly disappointing, only three getting through, and only one gaining the coveted gold medal. The success of the G.W.K. has been very complete in this year's big trials. H. F. S. Morgan drove with wonderful dash, and his ascent of Tow Top was amazing; he even passed solo mounts on his way up. The J.B.S. is a new comer among cycle cars in big trials, and its success in finishing must have been very encouraging to its makers.

Having become thoroughly accustomed to climbing stony mountain tracks, the Lea-Francis riders—Lea and Francis, sons of the principals of their firm—made a detour to Honister on the way home, and succeeded in climbing the pass from the Buttermere or steepest side. This test is the more noteworthy, following, as it does, upon five days of constant hill-climbing under observation.

As usual there was a good deal of very second rate driving. A large proportion of the failures on hills were due to sheer bad driving—rushing at bad corners being the most pronounced vice. "Dogged does it" is a good motto, and if only the more dashing riders would take the bad corners more carefully the A.C.U. would undoubtedly have had to hand out more gold medals.

Those competitors who did so much grumbling about the severity of the course and the strenuous conditions did not seem to realise that they were all the time adding further testimony to the performances of the forty odd who carried out the test satisfactorily. True there were good reasons for grumbling, but some riders who failed complained at anything and everything.

TABLE OF OFFICIAL RESULTS (continued).

Rider and Machine.	Fig. of Merit for Whole Trial.	Total Marks, including Bonus.	Marks Lost.	Nett Marks Obtained.	Award.
DIVISION I.—750 c.c.					
E. Hawkes (5-6 Rudge)	125.03	102	83	19	Bronze medal
J. A. Neumann (5-6 Rudge)	119.48	102			
J. P. Macdonald (4½ Norton)	109.68	104	17	87	Silver medal
G. T. Gray (5-6 Rudge)	112.47	100	18	82	Silver medal
H. W. Tweedon (3½ James)	121.73	100	90	10	Bronze medal
R. Drinkall (4½ Quadrant)	96.83	96.4	8	88.4	Silver medal
G. Castagnoli (4 L.M.C.)	90.37	90.2	12	80.2	Silver medal
L. A. Bees (4 L.M.C.)	106.32	100	5	95	Gold medal
H. Blamire (5-6 Hazlewood)	112.96	100	9	91	Gold medal
F. H. May (5-6 A.J.S.)	97.7	99.2	48	51.2	—
G. W. Braithwaite (5-6 Rudge)	129.82	100	14	86	Silver medal
P. Platt (3½ Bradbury)	133.47	102	0	100	Gold medal
H. E. Haswell (3½ Bradbury)	122.92	100	22	78	Silver medal
G. Hunt (5-6 Campion)	139.6	100	25	75	Silver medal
H. J. Beal (4 L.M.C.)	83.35	83.35	71	12.35	Bronze medal
J. Richard (4½ Sun-Precision)	114.62	102	39	63	Bronze medal
J. D. Drysdale (5-6 Hazlewood)	110.1	102	22	80	Silver medal
J. Baker (3½ Scott)	123.46	102	67	35	—
F. A. Applebee (3½ Scott)	135.96	104	0	100	Gold medal
J. N. Longfield (3½ Scott)	118.76	98.96	25	71.96	Bronze medal
CLASS E.—1,000 c.c.					
E. A. Colliver (7 Indian)	141.05	102	6	96	Gold medal
B. A. Hill (7 Indian)	134.55	102	8	94	Gold medal
S. T. Tessier (5-6 Bat)	107.96	103.6	0	100	Gold medal
J. R. Alexander (7 Indian)	140.56	104	19	85	Silver medal
G. A. Gregson (6 Bat)	131.33	104	0	100	Gold medal
A. Sumner (8 Zenith)	133.7	102	9	93	Gold medal
J. Haslam (6 Zenith)	112.36	100	10	90	Gold medal
H. Jepson (8 Zenith)	103.99	97.2	16	81.2	Silver medal
J. F. Morrison (5-6 Bat)	99.73	100	38	58	Bronze medal
DIVISION II.—CLASS H: SIDECARS AND THREE-WHEELED CYCLE CARS, 750 c.c.					
H. Gibson (3½ Bradbury)	128.52	100	9	91	Gold medal
A. J. Stevens (5-6 A.J.S.)	82.76	82.8	1	81.8	Silver medal
D. Bell (6 A.J.S.)	106.47	100	4	96	Gold medal
R. Pearson (5-6 Clyno)	135.74	104	5	99	Gold medal
C. Freeman (5-6 Clyno)	119.39	103	14	89	Gold medal
G. Wray (5-6 Clyno)	None	82	10	72	Silver medal
G. Nott (5-6 Clyno)	114.05	104	54	50	Bronze medal
DIVISION II.—CLASS I: SIDECARS AND THREE-WHEELED CYCLE CARS, 1000 c.c.					
W. H. Egginton (6 Enfield)	123.58	102	32	70	Silver medal
F. Crosthwaite (8 Matchless)	74.13	75.39	110	75.39	Silver medal
F. Turvey, jun. (6 Enfield)	137.16	102	25	77	Silver medal
C. R. Collier (7-8 Match ess)	141.11	104	24	80	Silver medal
R. E. Guest (7-8 Matchless)	132.64	104	42	62	Bronze medal
H. F. S. Morgan (8 Morgan)	134.81	102	12	90	Gold medal
DIVISION III.—CLASS K: CYCLE CARS, 1100 c.c.					
C. M. Keiller (8 G.W.K.)	133.64	104	0	100	Gold medal
E. B. Slater (8 J.B.S.)	115.89	95	37	58	Bronze medal

L. A. Bees (3½ h.p. L.M.C.) climbing Dacre Bank on the last day. He was one of the most consistent riders in the trial.

The speed of the G.W.K. in the speed test was 39.52 m.p.h.

The 8 h.p. Zenith-Gradua, on which A. V. Sumner accomplished such a fine performance in the flexibility hill-climbing test, was geared 3½ to 6 to 1. F. A. Applebee (Scott) came out top on the formula.

The retirements on the various days were as follows:

Monday	9
Tuesday	13
Wednesday	13
Thursday	10
Friday	9

De la Hay's success on the Sunbeam was well deserved. Throughout the trial we never saw him make a single adjustment, and the way his 2¾ h.p. machine climbed hills was an eye-opener to many.

Shemans, the Triumph rider, had ill-luck with tyres on the second day of the trial. He had used up two spare tubes, badly damaged his cover, and only got to Carlisle by stuffing the cover with grass by the aid of village boys. Next morning he changed the cover, and for the next three days never had the slightest trouble. Such is luck!

SPECIAL AWARDS.

WINNERS OF INTERNATIONAL TRIAL.

Great Britain.

Team.—W. B. Gibb (2¾ h.p. two-speed chain and belt driven Douglas), figure of merit 124.78; W. B. Little (3½ h.p. three-speed belt driven Premier), figure of merit 112.06; and C. R. Collier (8 h.p. three-speed chain driven Matchless sc.), figure of merit 141.11.

PRIZE PRESENTED BY THE CUMBERLAND COUNTY M.C.C. FOR BEST PERFORMANCE IN DIVISION I. (MOTOR BICYCLES).

T. C. de la Hay (2¾ h.p. two-speed chain driven Sunbeam); figure of merit, 142.55.

PRIZE PRESENTED BY MR. J. WHEATLEY FOR THE BEST PERFORMANCE IN DIVISION II. (SIDECARS AND THREE-WHEELED CYCLE CARS).

Rex Pearson (5-6 h.p. three-speed chain driven Clyno sc.); figure of merit, 135.74.

PRIZE OFFERED BY THE ELECTRICAL ENGINEERING AND MOTORING CO., CARLISLE, FOR THE BEST PERFORMANCE IN DIVISION III. (FOUR-WHEELED CYCLE CARS).

C. M. Keiller (8 h.p. friction-driven G.W.K.); figure of merit, 133.64.

BEST PERFORMANCE BY A TEAM OF THREE NOMINATED BY A MANUFACTURER.

The Ariel Team.—F. C. North (figure of merit 120.14), L. Newey (figure of merit 116.78), and V. Busby (figure of merit 135.56), all on three-speed belt driven machines.

A PRIZE OFFERED BY HIS WORSHIP THE MAYOR OF CARLISLE FOR THE BEST PERFORMANCE BY AN AFFILIATED CLUB TEAM.

The Westmorland M.C.C. Team.—W. Westwood (3½ h.p. Triumph), G. W. Braithwaite (5-6 h.p. Rudge), and Hugh Gibson (3½ h.p. Bradbury sc.)

VELOCE

IN A.C.U. SIX DAYS' TRIALS,

INGHAM, on 3½ h.p., awarded GOLD MEDAL,

Gaining 96 Marks out of a possible 100.

GUTGEMANN, on 2¾ h.p. Patent Two-speed, Forced Lubrication, CLIMBED ALL MOUNTAIN PASSES WITH EASE.

Finished Course, delayed last day through Wet Magneto.

TIME TO LIGHT LAMPS.

Aug. 28th	... ...	7.55 p.m.
,, 30th	... ...	7.51 ,,
Sept. 1st	... ...	7.46 ,,
,, 3rd	... ...	7.42 ,,

Coventry Open Hill-climb.

To avoid clashing with other events, the Coventry and Warwickshire M.C. has postponed its eighth annual hill-climb to Saturday, October 11th.

A Rumour Dispelled.

Auto-Carriers (1911), Ltd., inform us that rumours have reached them that they contemplate giving up the manufacture of the A.C. three-wheeled cycle car, and that in consequence there may be a difficulty in securing spares for this type of machine. The company ask us to announce that this rumour has no foundation in fact.

Speed Trials at Wimborne.

By the kind permission of Lady Wimborne, the Bournemouth and District M.C.C. are able to hold their open speed trials in Canford Park Wimborne, where a three-quarter of a mile stretch of road is available. The trial is already being well supported, and thirty-eight individual entries have been received. These include many well-known riders.

Military Motor Cyclists.

Midland readers who are contemplating serving in the Special Motor Cyclists' Reserve, South Midland Division, should communicate with Captain J. Huxley, secretary of the S.M. Division, 132, Greenfield Road, Harborne, Birmingham.

Manchester M.C. Reliability Test.

The result of the two-days motor and cycle car reliability trial to Colwyn Bay and back was as follows: Solo: 1, W. W. Heaton (2¾ A.J.S.). Passenger: W. Rolison (G.W.K.)

The Wolseley-Vickers Voiturette.

This new machine, which is described on pages 1134 and 5, will be known as the Stellite cycle car. The designing and all experimental work in connection with the establishment of the model have been undertaken by the Wolseley Tool and Motor Car Co., Ltd., but the manufacture and sale will be in the hands of the Electric and Ordnance Accessories Co., Cheston Road, Aston, Birmingham. Both this company and the Wolseley Co. are branches of the great firm of Vickers, Ltd., hence their collaboration in the matter. A preliminary batch of one thousand has been put in hand, and the price is one hundred and fifty guineas, which includes hood, screen, three paraffin lamps, horn, and a suitable equipment of tools.

SIX DAYS' TRIALS. The final stretch (known as "The Struggle") on Kirkstone Pass. Ellison Hawkes (5-6 h.p. Rudge) is seen nearing the summit, gradient 1 in 5.

SPECIAL FEATURES:

THE NEW STELLITE CYCLE CAR.
Described and Illustrated.

CONTINUATION OF A.C.U. SIX DAYS' TRIALS REPORT.
Many Striking Photographs.

TEST OF A NEW THREE-SPEED HUB GEAR

Miss A. H. Neville, a Worthing lady who has established a motor garage—a new departure for her sex. In the photograph Miss Neville is seen starting off for a run on her 2¾ h.p. Douglas with a lady passenger on the carrier.

Mont Ventoux Hill-climb.

The important feature of this French event was the beating of Lamberjack's 1905 record for the hill by Lavanchy on a Motosacoche, whose time was 23m. 30⅘s. Lamberjack's time was 25m. 48⅕s. on a very much larger engined Griffon machine. The only British competitor this year was Frank Smith, who drove his Clyno and sidecar up the hill in 31m. 5⅕s.

The winner of the lightweight motor cycle class rode a Terrot, the lightweight sidecar class a Motosacoche, and the first in the cycle car class drove a Baby Peugeot. The car record for the hill made by Boillot (Peugeot) on the 24th inst., is 17m. 38s.

isit to the States.

Mr. W. H. Wells sailed for America n Saturday last to pay his annual visit o the works of the Hendee Manufacuring Co., Springfield, Mass. He is xpected back in this country towards he end of September.

A Home-made Featherweight.

A Beckenham motor cyclist, named A. . Preston, has just completed a 2 h.p. eatherweight of his own design and uild throughout, weighing 85 lbs. The ingle-cylinder engine develops 2 h.p., eighs 20 lbs., and has overhead valves, he tappets being enclosed in a dust roof cover. A Brampton variable pulley ear is fitted with B. and B. carburetter nd Ruthardt magneto. The wheels are 26in. × 2in.

The Cape to Cairo Expeditionary Reforce.

The Survey and Scientific Research Expeditionary Reforce, which will shortly undertake the journey from the Cape to Cairo under the command of Capt. R. N. Kelsey, has decided to take a motor bicycle, which will be used mainly for the carrying of despatches, letters, etc., to the nearest point of communication, and for bringing in supplies in case of emergency. The machine Capt. Kelsey has selected is a Triumph. The object of the expedition is general exploration, big game hunting, and photography. After touching the principal towns in South Africa, the expedition will proceed straight through Khartoum to Cairo.

A Flying Meeting for Motor Cyclists.

In addition to other flights at the special motor cyclists' flying meeting at the London Aerodrome, Hendon, to be held to-day (Thursday) at 3 p.m., particulars of which have already been published in *The Motor Cycle*, a grand speed handicap has been arranged for a valuable trophy and cash prizes. Many of the pilots who have entered for the Aerial Derby will take part in this event, including G. W. Beatty, the famous American airman, P. Verrier, Lieut. Porte, R.N., Louis Noel, Robert Slack, E. Marty, and C. Grahame-White. All the coupons given up at the entrance gates will be collected, and the motor cyclist whose name and address are on the winning coupon will be entitled to a free passenger flight. It is anticipated that some remarkably high speeds will be attained at this meeting, as several new machines have already arrived, which are intended for the Aerial Derby, including an 80 h.p. Morane-Saulnier monoplane.

A.A. and M.U. Notes.

Territorial Manœuvres: Important Warning.—As Territorial manœuvres will commence on the Coventry Road to-day (Thursday), with a base at Daventry, the A.A. and M.U. advises motorists to use the roads in this neighbourhood, and particularly those around Daventry and Weedon, with caution, especially after dark.

Hill Signs indicating Gradients.—Quite a new departure in road signs has just been instituted by the Association in connection with danger signs. Gradients alone are not necessarily dangerous, but where there are dangerous corners, or hidden roads leading on to the hill, a warning sign is often necessary, and several such signs have been put up by the A.A. and M.U. The first of the new A.A. and M.U. warning signs on hills has just been erected on Beggars' Roost Hill, in North Devon, and its warning to motorists and road users is that the gradient is 3 in 10.

Bridge Closed.—The Widnes transport bridge will be closed to traffic from September 15th until further notice for the purpose of alterations and improvements.

FUTURE EVENTS.

Aug. 30.—Streatham and District M.C.C. Annual Open Hill-climb.
" 30.—Hertfordshire M.C.C. Open Half Day Trial.
Sept. 3.—Bournemouth & District M.C.C. Open Speed Trials.
" 6.—Scottish A.C.U. Speed Championships at St. Andrews.
" 6.—A.C.U. East Midland Centre Speed Trials.
" 13.—B.M.C.R.C. Race Meeting.
" 20.—Streatham M.C.C. Open Speed Trials at Brighton.
" 24.—A.C.U. Open One Day Trial.
" 27.—B.A.R.C. Brooklands Meeting.
Oct. 11.—Coventry and Warwickshire M.C. Annual Open Hill-climb.

Cycle Car Taxes in France.

The question of taxation of cycle cars has, up to the present, been rather a vexed one in France, as there does not appear to be any definite ruling as to what constitutes a cycle car. Motor bicycles and sidecars pay 24 francs, whereas small cars pay 5 francs per horse-power, in addition to the ordinary taxes. An owner of a Super tandem cycle car has, however, received an official intimation that his vehicle comes under the heading of a "moto cycle à deux places." This type of vehicle at any rate, irrespective of the number of wheels, is taxed as a motor cycle in France. The ruling appears to be discretionary.

Open Cut-outs.

Several motor cyclists were summoned at Chepstow last week for using cut-outs of an illegal form. It was, however, pointed out that the gases first passed into the expansion chamber, and, consequently, the summonses were dismissed.

Harry Martin in Hospital

We are sorry to hear that Harry Martin is still in the Weybridge Cottage Hospital as a result of the accident he sustained at the Brooklands track on the 9th inst. He has sustained a ruptured muscle of the right thigh, which, together with a damaged nerve centre, will prevent him racing for some time, and may possibly prevent him competing again.

Motor Traffic.

A question was recently asked in the House of Commons by Mr. C. Money with reference to the use of the highways that carried with it the imputation that motor cyclists as a whole were addicted to dangerous driving and to making an unnecessary noise, and that, in consequence, the roads were rendered unsafe for pedestrians. Mr. McKenna replied that he did not think that these offences were so common as was suggested, and that he considered the existing powers of the magistrates quite sufficient. In this matter we agree with Mr. McKenna, though we must admit that there are many inconsiderate motor cyclists on the road who, by their thoughtless and selfish conduct, do their best to stir up the authorities.

Standardisation of Screw Threads.

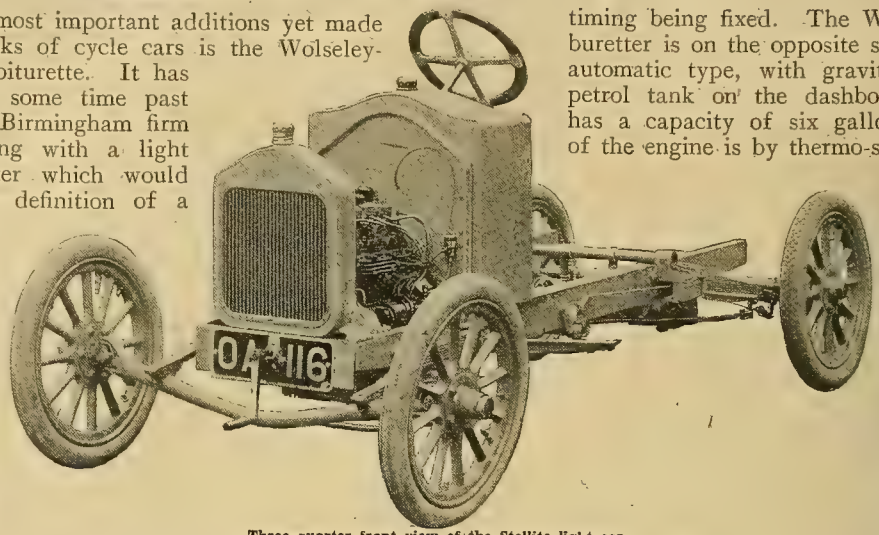
The Engineering Standards Committee, of which society Mr. Leslie S. Robertson, M.I.C.E., 28, Victoria Street, Westminster, S.W., is the secretary, is dealing with the question of standardisation of automobile parts. In reply to our enquiry as to whether standards for cycle cars and motor cycles will be dealt with by the committee, we are informed that the standardisation of details, such as the threads on screws and nuts and screw threads generally, would affect them, but no standardisation of design would be contemplated.

A confetti carnival was held at Sea View, Isle of Wight, on Saturday last, when all passing motor cyclists were surrounded and covered with confetti as shown in the above photograph.

The New Wolseley-Vickers Voiturette.

To be known as the Stellite Cycle Car, and made by the Electric and Ordnance Accessories Co., Birmingham, another Vickers firm.

ONE of the most important additions yet made to the ranks of cycle cars is the Wolseley-Vickers Voiturette. It has been known for some time past that the famous Birmingham firm were experimenting with a light type of two-seater which would come within the definition of a cycle car; and, in fact, it is now some weeks ago since representatives of this journal were favoured with a trial run on this new car. Its advent will be hailed with delight by those who lean towards the light two-seater type of vehicle, as, coming from such a world-renowned concern, it may be taken for granted that the workmanship will be of the best, and the quality of materials of the finest. The Wolseley Co. are amongst the oldest manufacturers of motor cars, and their experience is bound to stand them in good stead. The Stellite light car is to be made in quantities, and, although the details are being made public for the first time this week, in less than twelve months hence its design is bound to be familiar to everyone, and its name will be on the lips of all motorists.

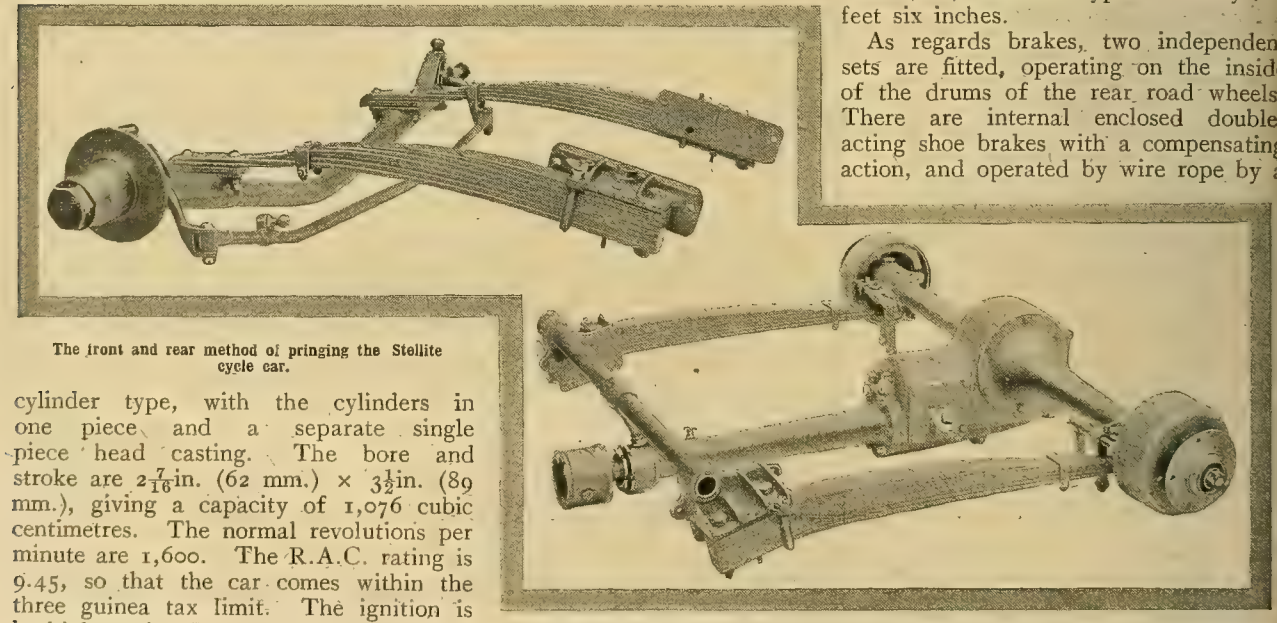


Three-quarter front view of the Stellite light car.

Dealing first with the engine: it is of the four-cylinder type, with the cylinders in one piece and a separate single piece head casting. The bore and stroke are $2\frac{7}{16}$in. (62 mm.) × $3\frac{1}{2}$in. (89 mm.), giving a capacity of 1,076 cubic centimetres. The normal revolutions per minute are 1,600. The R.A.C. rating is 9·45, so that the car comes within the three guinea tax limit. The ignition is by high-tension Bosch magneto, the spark timing being fixed. The Wolseley S.U. carburetter is on the opposite side, and is of the automatic type, with gravity feed from the petrol tank on the dashboard, which latter has a capacity of six gallons. The cooling of the engine is by thermo-syphon circulation, the radiator adopted being of large capacity and of exceedingly handsome design. The clutch is of the leather cone type, and the transmission by a universally-jointed shaft to the combined gear box and live axle. At normal engine speed, with the standard two-speed gear box (7/38 worm ratio), the road speeds are: First gear, $9\frac{1}{2}$ m.p.h.; second gear, 24 m.p.h.; reverse, $8\frac{1}{2}$ m.p.h. The range of speed on the top gear on the level is from 8 to 35 m.p.h. As is usually the case, a single lever operates all changes of speed.

The frame is of armoured wood, suspended at each end on long leaf springs. The front axle is of tubular construction, the hubs running on compound roller bearings. The rear axle, as already mentioned, is of the live type, driven by worm gear, and has ball and roller bearings throughout. The steering is irreversible through rack and pinion, and the minimum turning circle with standard types is thirty-two feet six inches.

As regards brakes, two independent sets are fitted, operating on the inside of the drums of the rear road wheels. There are internal enclosed double-acting shoe brakes with a compensating action, and operated by wire rope by a



The front and rear method of pringing the Stellite cycle car.

In the second illustration may also be seen the two-speed and reverse gear and back axle unit.

he New Wolseley-Vickers Voiturette.—

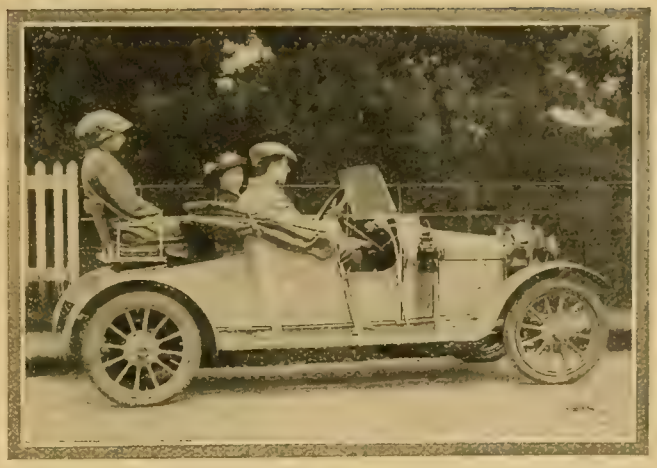
and lever and pedal respectively. The front and ear portions of the chassis are assembled separately nd then built up with the frame. By this method f construction the working parts should be readily ccessible in case of trouble.

Some measurements of the car will prove of interest. he wheelbase is 8ft.; track, 3ft. 10in.; overall ngth of chassis, 10ft. 4in.; overall width of chassis, ft. 8in.; minimum road clearance, 6½in.

The road wheels, as will be seen from the photo-raphs, are of the wood artillery pattern, approxi-nately 28½in. diameter, and the tyres fitted are of 00 × 80 mm. section.

The Stellite will be sold in more than one type, nd the chassis may be ordered specially sprung to uit the weight of a three-seater body.

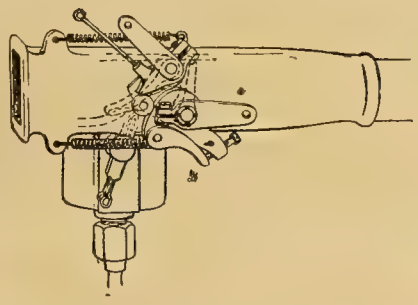
The control is by an auxiliary pedal placed midway etween the clutch and brake pedals in the usual way, nd hand adjustment to the carburetter is provided on he dash.



The 8-10 h.p. Stellite, as will be seen, is fitted with a neat folding dick y seat for a third passenger.

A VARIABLE CHOKE CARBURETTER.

A new carburetter is shortly to be narketed, the feature of which consists of a choke tube which is variable with the hrottle lever. The main body of the arburetter consists of a rectangular tube n which two jets are mounted, side by ide, the size of both being adjustable. The two jets are mounted on a slight ngle, and their orifices project through a slight hump in the casting which forms he lower part of the choke. The upper art of the choke consists of a slightly urved flap which is pivoted at the top of the tube and shuts down until its urved edge rests on the hump before



mentioned. A flap throttle is fitted on the engine side of the jets. The carburetter may be used either as a two-lever or automatic device, a simple cam arrangement interconnecting the two flaps, the relative positions being instantly adjustable. The principle of the carburetter may be easily followed with reference to the sketches. The construction is simple and there is nothing to get out of order. We dealt with the forerunner of this type a couple of months ago. The designer is F. A. Burgess, Cranleigh, Surrey.

SIX DAYS' TRIALS. C. T. Newsome (3½ h.p. Rover) and L. Sealey (3½ h.p. B.S.A.) on Crossdale Hill on the third day.

LIEGE-PARIS-LIEGE TRIAL.

English Machines Conspicuous Successes.

ON Friday, the 15th inst., at 2 a.m., the competitors were started from Liège at one minute intervals on the journey of 525 miles. There were sixty-five starters in all. The first part of the course was very severe on account of the wretched *pavé* through Liège and its outskirts. After leaving Liège the riders were treated to some fine scenery. The French frontier was crossed at Givet, and by special arrangement the competitors were passed through very quickly upon payment of 50 centimes to secure a permit to enter France. The principal troubles on the outward journey were punctures.

Lunch was taken at Laon, at which point the machines were deposited in the *Parc fermé*. The section between Meaux and Chelles was remarkable for its very bad road surface, and those who had trouble were practically out of the competition, for there was no time to do repairs.

The average pace set for the 500 c.c. class was 25 m.p.h., but over the bad surfaces, bends, and villages the average was very difficult to maintain. A very excellent system of timing the competitors by sealed watches had been arranged.

Liefeldt, a Coventry amateur on a Rudge, punctured twenty-eight kilometres from Chelles, found his back tyre was beyond repair, and rode in on the rim. Arriving at Paris he wired to Coventry for another wheel, which he fitted before starting on Sunday morning. After going to all this trouble he had to retire through further tyre trouble. Out of sixty-five starters forty-two reached Paris.

The return journey was commenced at 3.30 a.m. Sunday, the small machines being sent off first.

After reaching Soissons, the route branched southward through charming country. In all the towns the utmost enthusiasm was displayed by the inhabitants. Near Sedan one of the Sarolea riders (Dewale) had a bad fall, and was taken to hospital suffering from concussion

The lunch control was at Bouillon, and after passing the Customs, the riders were once more in Belgium.

At Spa there was a speed trial and hill-climb. These are treated as different events, and special prizes are awarded. Both the events were exceedingly dangerous. The kilometre over which the speed trial was run consisted of a stretch of *pavé* between an avenue of trees, and, as it had rained immediately before the speed trial commenced, the riders declared it was far too dangerous and did not force their machines. The hill-climb was held on a road which was not closed to other traffic, and Rowlandson, cutting in on his wrong side to take the bend, was met by a huge automobile; he had no other alternative but to take to the hedge, luckily without damage.

The control at Liège was on one of the central Boulevards, and the thousands of people were kept back by policemen. As the Englishmen arrived, the band struck up "God Save the King"; in fact, as each competitor arrived the National Anthem of his country was played.

Of the forty-two that started on the return journey, thirty-five reached home. The winners of first-class awards are as follows:

S. A. Rowlandson (3½ Rudge-Multi)
A. J. Dixon (3½ Singer)
Conriamont (3½ three-speed Premier)
Milhoux (5-6 Rudge-Multi)
Erodue (8 Matchless)
Spedwell (3½ Sarolea)
Janssens (3½ Rudge-Multi)
Dehaybe (3½ Sarolea)
Paquay (3½ Singer)

CLUB NEWS.

Foleshill and North Warwickshire M.C.C.

There will be two open classes at the annual hill-climb. Chief award, the Bettmann Cup. Entries to Mr. W. H. Broad, Foleshill Road, Coventry, by September 13th.

Mersey (Liverpool) M.C.

An expert-barred open hill-climb will take place on September 13th at Pen-y-Ball. There will be classes for motor cycles of 350 c.c., 500 c.c., 750 c.c., and 1,000 c.c., and passenger machines of 500 c.c., 750 c.c., and 1,100 c.c. Entries must reach Mr. S. W. Carty, 5, Redcross Street, Liverpool, not later than September 6th.

East Essex M.C.C.

On the 16th inst. a hill-climb was held at Fiddler's Hill, Fordham. Results:

OPEN CLIMB.

	Formula.	Time.
J. C. Bland, junr. (Douglas)	31.5	31s.
E. Garland (Rudge-Multi)	38	30s.
Ashton Hill (Rudge)	38.6	26s.

UNDER 500 C.C.

Clifford Cant (Rudge-Multi)	31.8	25s.
J. C. Bland, junr. (Douglas)	32.3	32s.
E. Garland (Rudge-Multi)	38	30s.

The hill, which was an excellent one, comprised two bad bends. Clifford Cant won the Worthington-Evans Challenge Cup for the fastest time of the day.

Glasgow M.C.C.

A 100 mile non-stop trial took place on the 23rd inst. The route was as follows: Strathblane, Lennoxtown, Fintry, Killearn, Blanefield, Cult Brae, Drymen Road, Kyber Pass, Strathblane, the hills being Lennoxtown, Cult Brae, and the Kyber Pass, a long ascent with two hairpin bends; this had to be covered three times. The performances of the various riders on Cult Brae were all good, but special mention must be made of W. Carlaw (6 Enfield sc.), who took both bends in fine style. The appearance of the 8 Henderson for the first time in competition in Scotland was watched with interest, and both the silence and power of the machine greatly impressed those present. The three 5-6 F.N.'s also performed well, while the 6 A.J.S. combinations went up in their usual good style. In taking an awkward turn on joining the main road near Strathblane, A. Shaw (5-6 A.J.S. sc.), who was travelling rather fast, ran into the ditch, without, however, seriously damaging either machine or passenger. Belt slip caused the retirement of H. W. Ballardie (5-6 Hazlewood sc.), and a broken belt also accounted for A. R. Fraser (3½ Rudge). W. Hood (3½ Rudge Multi) hung on to his high gear too long, with the result that he conked out on the Kyber Pass. W. S. Pellew (8 Henderson) also came to grief here. J. E. Chisholm (3½ Ariel) had carburetter trouble, water accounting for this, while F. Galbraith (7 Indian) had plug trouble. J. McComb (3½ Edmund) was most unfortunate, a stone getting into the belt rim and throwing off his belt. G. Taylor (3½ Rudge) was baulked by another competitor and came off, but re-started. The following riders finished the course, but have not necessarily made non-stop runs: W. Hood (3½ Rudge-Multi), W. Deans (3½ Ariel), W. Dickie (5-6 F.N.), W. S. Pellew (8 Henderson), R. Black (5-6 F.N.), W. B. Cramb (3½ Elswick), J. E. Chisholm (3½ Ariel), A. McCulloch (6 A.J.S. sc.), W. Carlaw (6 Enfield sc.), J. R. Bell (6 A.J.S. sc.), R. G. McGibbon (3½ Edmund), G. Taylor (3½ Rudge-Multi), A. D. Morrison (3½ Ariel), and T. S. V. Phillips (5-6 A.J.S. sc.)

Motor Cycling Club.

The following are the official results of the standard reliability and hill-climbing competition held on the 2nd and 4th inst.

M.C.C. Cup for best performance on a solo mount.—H. Karslake (Rover).

Gold Medals.—G. T. Gray (Rudge), B. Alan Hill (Indian), D. W. Popplewell (Triumph), H. A. Cooper (Bradbury), A. T. Stanton (Bradbury), H. F. Edwards (Enfield), E. Kickham (Douglas), R. C. Davis (Clyno sc.), H. G. R. Slingo (Clyno sc.), A. J. Dixon (Singer), and L. Martin (Singer cycle car).

Silver Medals.—L. A. Baddeley (P. and M.), S. Tharp (Triumph), K. A. MacDonald (Singer), E. A. Colliver (Indian), C. Percival (Douglas) C. Macbeth (Douglas), S. G. Frost (Douglas), J. D. Drysdale (Hazlewood) M. C. Breese (B.S.A.), R. M. Marians (P. and M.), L. A. Bees (L.M.C.), and W. P. Tippett (Humber).

Club News.—

Manchester M.C.

A gymkhana was held on the 16th inst. This was so successful that another will be held in September.

Bradford M.C.C.

The results of the Bradford-Edinburgh-Bradford reliability trials, run August 9th and 10th, were as follows:

Class 1, for teams.—The Dewsbury M.C.C. were the winners, the riders being J. H. Dunstan (3½ h.p. Rudge), J. F. Rispin (3½ h.p. Triumph), and H. Hartley (3½ h.p. Rudge), who were awarded club standard gold medals.

Class 2, for the best performance of the day, solo or sidecar.—The P. and M. Cup was awarded outright to F. Harrison (6 h.p. A.J.S. sc.)

Class 3, for the best sidecar performance, independent of Class 2, the award being the Merrick Trophy, to be won outright.—G. Riddiough (7 h.p. Indian sc.)

Dublin and District M.C.C.

A slow hill-climb was held on the 16th inst. on the steep and twisty hill leading from Glencullen Bridge. The weather was ideal, and a large number of spectators turned out to watch the event. Results:

Class A.—Engines not exceeding 500 c.c., gear ratio 6 to 1.

		Time.
1.	T. E. Greene (3½ Rudge)	2m. 8⅘s.

All the other competitors, in their efforts to travel very slowly, failed to climb the hill.

Class B.—Unrestricted as to engine size or gear ratio.

1.	J. Doleman (2¾ Douglas)	4m. 23s.
2.	G. Roche (3½ Rover)	4m. 8⅗s.
3.	W. J. Corbet (3½ Ariel)	3m. 13s.

Class C.—Sidecars, unrestricted.

1.	G. Roche (3½ Rover sc.)	3m. 45⅖s.
2.	T. D. Rollins (6 Clyno sc.)	2m. 24⅕s.

Results of Glengariffe and Back Trial, 460 Miles.

Silver Cup and Gold Medal.—G. Roche (3½ Rover), 200 marks (maximum 200).

Gold Medals.—J. Doleman (3½ Rudge), 197; D. J. Farrell (3½ Triumph), 197; R. Walsh (3½ Bradbury), 197; J. Healy (3½ Rudge), 196; and T. Wrench (7 Indian), 193.

Silver Medals.—P. O'Sullivan (3½ Humber), 193; M. Carson (3½ Rudge), 190; and T. E. Greene (3½ Rudge), 189.

Bronze Medals.—T. Woods (3½ P. and M.), G. Tyson (3½ Triumph), J. Browne (3½ Rudge), and W. J. Henderson (3½ Rudge).

Roche already holds the Club Cup since last season, and by his second win he makes it his own property.

The club is holding a reliability trial on Saturday next, in connection with which the tie for the White Cup is to be run off.

Burton-on-Trent M.C.C. and Ashby M.C.C.

A combined hill-climb was held on the 20th inst. at Draycott Cliff. Results:
